performance his admirer Mr Boswell cannot, he says, perceive that ability of argument or that felicity of expression for which on other occasions Johnson was so eminent. This is a singular criticism. To the assumed principle upon which the reasoning of the pamphlet rests many have objected, and perhaps their objections are well founded; but if it be admitted that "the Supreme Power of every community has the right of requiring from all its subjects such contributions as are necessary to the public safety or public prosperity," it will be found a very difficult task to break the chain of arguments by which it is proved that the British parliament had a right to tax the Americans. As to the *expression* of the pamphlet, the reader, who adopts the maxim recorded in the "Journal of a tour to the Hebrides," that a controvertit "ought not to strike soft in battle," must acknowledge that it is uncommonly happy, and that the whole performance is one of the most brilliant as well as most correct pieces of composition that ever fell from the pen of its author. These essays drew upon him numerous attacks, all of which he heartily despised; for though it has been supposed that "A letter addressed to Dr Samuel Johnson occasioned by his political publications," gave him great uneasiness, the contrary is manifest, from his having, after the appearance of that letter, collected them into a volume with the title of "Political Tracts by the author of the Rambler." In 1765 Trinity College Dublin had created him L.L.D. by diploma, and he now received the same honour from the University of Oxford; an honour with which, though he did not boast of it, he was highly gratified. In 1777 he was induced, by a case of a very extraordinary nature, to exercise that humanity which in him was obedient to every call. Dr William Dodd, a clergyman, under sentence of death for the crime of forgery, found means to interest Johnson in his behalf, and procured from him two of the most energetic compositions of the kind ever seen; the one a petition from himself to the king, the other a like address from his wife to the queen. These petitions failed of success.

The principal booksellers in London having determined to publish a body of English poetry, Johnson was prevailed upon to write the lives of the poets, and give a character of the works of each. This task he undertook with alacrity, and executed it in such a manner as must convince every competent reader, that as a biographer and a critic, no nation can produce his equal. The work was published in ten small volumes, of which the first four came abroad 1778, and the others in 1781. While the world in general was filled with admiration of the stupendous powers of that man, who at the age of seventy two, and labouring under a complication of diseases, could produce a work which displays so much genius and so much learning; there were narrow circles in which prejudice and resentment were fostered, and whence attacks of different sorts issued againll him. These gave him not the smallest disturbance. When told of the feeble, though shrill, outcry that had been raised, he said— "Sir, I considered myself as entrusted with a certain portion of truth. I have given my opinion sincerely; let them show where they think me wrong."

He had hardly begun to reap the laurels gained by,

Johnson.

this performance, when death deprived him of Mr Thrale, in whose house he had enjoyed the most comfortable hours of his life; but it abated not in Johnson that care for the interests of those whom his friend had left behind him, which he thought himself bound to cherish, both in duty as one of the executors of his will, and from the nobler principle of gratitude. On this account, his visits to Streatham, Mr Thrale's villa, were for some time after his death regularly made on Monday and protracted till Saturday, as they had been during his life; but they soon became less and less frequent, and he studiously avoided the mention of the place or the family. Mrs Thrale, now Piozzi, says indeed, that "it grew extremely perplexing and difficult to live in the house with him when the master of it was no more; because his dislikes grew capricious, and he could scarce bear to have any body come to the house whom it was absolutely necessary for her to see." The person whom she thought it most necessary for her to see may perhaps be guessed at without any superior share of sagacity; and if these were the visits which Johnson could not bear, we are so far from thinking his dislikes capricious, though they may have been perplexing, that if he had acted otherwise, we should have blamed him for want of gratitude to the friend whose "face for fifteen years had never been turned upon him but with respect or benignity."

About the middle of June 1783 his constitution sustained a severer shock than it had ever before felt, by a stroke of the palsy; so sudden and so violent, that it awakened him out of a sound sleep, and rendered him for a short time speechless. As usual, his recourse under this affliction was to piety, which in him was constant, sincere, and fervent. He tried to repeat the Lord's prayer first in English, then in Latin, and afterwards in Greek; but succeeded only in the last attempt; immediately after which he was again deprived of the power of articulation. From this alarming attack he recovered with wonderful quickness, but it left behind it some prefaces of an hydropic affection; and he was soon afterwards seized with a spasmodic asthma of such violence that he was confined to the house in great pain, while his dropsy increased notwithstanding all the efforts of the most eminent physicians in London and Edinburgh. He had, however, such an interval of ease as enabled him in the summer 1784 to visit his friends at Oxford, Lichfield, and Ashbourne in Derbyshire. The Romish religion being introduced one day as the topic of conversation when he was in the house of Dr Adams, Johnson said, "If you join the papists externally, they will not interrogate you strictly as to your belief in their tenets. No reasoning papist believes every article of their faith. There is one side on which a good man might be persuaded to embrace it. A good man of a timorous disposition, in great doubt of his acceptance with God, and pretty credulous, might be glad of a church where there are so many helps to go to heaven. I would be a papist if I could. I have fear enough; but an obstinate rationality prevents me. I shall never be a papist unless on the near approach of death, of which I have very great terror."

His constant dread of death was indeed so great, that it astonished all who had access to know the piety of his mind and the virtues of his life. Attempts have been

made to account for it in various ways; but doubtless that is the true account which is given in the *Olla Podrida*, by an elegant and pious writer, who now adorns a high station in the church of England. "That he should not be conscious of the abilities with which Providence had blessed him, was impossible. He felt his own powers; he felt what he was capable of having performed; and he saw how little, comparatively speaking, he had performed. Hence his apprehension on the near prospect of the account to be made, viewed through the medium of constitutional and morbid melancholy, which often excluded from his sight the bright beams of divine mercy." This, however, was the case only while death was approaching from some distance. From the time that he was certain it was near, all his fears were calmed; and he died on the 13th of December 1784, full of resignation, strengthened by faith, and joyful in hope.

For a just character of this great man our limits afford not room: we must therefore content ourselves with laying before our readers a very short sketch. His stature was tall, his limbs were large, his strength was more than common, and his activity in early life had been greater than such a form gave reason to expect: but he was subject to an infirmity of the convulsive kind, resembling the distemper called St Vitus's dance; and he had the seeds of so many diseases sown in his constitution, that a short time before his death he declared that he hardly remembered to have passed one day wholly free from pain. He possessed very extraordinary powers of understanding; which were much cultivated by reading, and still more by meditation and reflection. His memory was remarkably retentive, his imagination uncommonly vigorous, and his judgment keen and penetrating. He read with great rapidity, retained with wonderful exactness what he so easily collected, and possessed the power of reducing to order and system the scattered hints on any subject which he had gathered from different books. It would not perhaps be safe to claim for him the highest place, among his contemporaries, in any single department of literature; but, to use one of his own expressions, he brought more *mind* to every subject, and had a greater variety of knowledge *ready* for all occasions, than any other man that could be easily named. Though prone to superstition, he was in all other respects so remarkably incredulous, that Hogarth said, while Johnson firmly believed the bible, he seemed determined to believe nothing but the bible. Of the importance of religion he had a strong sense, and his zeal for its interests were always awake, so that profaneness of every kind was abashed in his presence. The same energy which was displayed in his literary productions, was exhibited also in his conversation, which was various, striking, and instructive: like the sage in *Rasselas*, he spoke, and attention watched his lips; he reasoned, and conviction closed his periods: when he pleased, he could be the greatest sophist that ever contended in the lists of declamation; and perhaps no man ever equalled him in nervous and pointed repartees. His veracity from the most trivial to the most solemn occasions, was strict even to severity: he scorned to embellish a story with fictitious circumstances; for what is not a representation of reality, he used to say, is not worthy of our attention. As his

Johns

purse and his house were ever open to the indigent, so was his heart tender to those who wanted relief, and his soul was susceptible of gratitude and every kind impression. He had a roughness in his manner which subdued the haughty and terrified the meek: but it was *only* in his *manner*; for no man was more loved than Johnson was by those who knew him; and his works will be read with veneration for their author as long as the language in which they are written shall be understood.

JOHNSTON, or JOHNSON (John), a learned divine, born in 1662. He was zealous for the Revolution, and preached a noted sermon at Feverham on the occasion, from the words, "Remember Lot's wife;" wherein he set forth the great danger of looking back, and vindicated the liturgy against Mr Baxter and others. He published *The Clergyman's Vade Mecum*, and *A Collection of Ecclesiastical Laws* as a continuation of it; but catching the infection spread by Dr Sachaverel, he, on the accession of Geo. I. to the amazement of all his old friends, entertained unfavourable thoughts of the Protestant succession, and refused to read the usual prayers for the king. Being prosecuted, however, he thought proper to submit; and died vicar of Cranbrook in Kent, in 1725.

JOHNSTON (Dr Arthur), was born at Caskieben, near Aberdeen, the seat of his ancestors, and probably was educated at Aberdeen, as he was afterwards advanced to the highest dignity in that university. The study he chiefly applied himself to was that of physic; and to improve himself in that science, he travelled into foreign parts. He was twice at Rome; but the chief place of his residence was Padua, in which university the degree of M. D. was conferred on him in 1610, as appears by a MS. copy of verses in the advocate's library in Edinburgh. After leaving Padua, he travelled through the rest of Italy, and over Germany, Denmark, England, Holland, and other countries; and at length settled in France; where he met with great applause as a Latin poet. He lived there 20 years, and by two wives had 13 children. After 24 years absence, he returned into Scotland in 1632. It appears by the Council Books at Edinburgh, that the Doctor had a suit at law before that court about that time. In the year following, it is very well known that Charles I. went into Scotland, and made bishop Laud, then with him, a member of that council: and by this accident, it is probable, that acquaintance began between the doctor and that prelate, which produced his "Psalmorum Davidis Paraphrasum Poëtica;" for we find that, in the same year, the doctor printed a specimen of his Psalms at London, and dedicated them to his lordship.

He proceeded to perfect the whole, which took him up four years; and the first edition complete was published at Aberdeen in 1637, and at London the same year. In 1641, Dr. Johnston being at Oxford, on a visit to one of his daughters who was married to a divine of the church of England in that place, was seized with a violent diarrhœa, of which he died in a few days, in the 54th year of his age, not without having seen the beginning of those troubles that proved so fatal to his patron. He was buried in the place where he died; which gave occasion to the fol-

lowing lines of his learned friend Wedderburn in his *Suffiria* on the Doctor's death:

Scotia mæsta, dole, tanti vi luata sepulchro  
Vatis; is Anglicæ contigit altus honos.

In what year Dr. Johnston was made physician to the king does not appear; it is most likely that the archbishop procured him that honour at his coming into England in 1633, at which time he translated Solomon's Song into Latin elegiac verse, and dedicated it to his majesty. His Psalms were reprinted at Middleburgh, 1642; London, 1657; Cambridge, . . . ; Amsterdam, 1706; Edinburgh, by William Lauder, 1739; and last on the plan of the Delphin classics, at London, 1741, 8vo, at the expense of auditor Benson, who dedicated them to his late majesty, and prefixed to this edition memoirs of Dr Johnston, with the testimonies of various learned persons. A labour'd comparison between the two translations of Buchanan and Johnston was printed the same year in English, in 8vo, intitled, "A Prefatory Discourse to Dr Johnston's Psalms, &c." and "A Conclusion to it." His translations of the Te Deum, Creed, Decalogue, &c. were subjoined to the Psalms. His other poetical works are his Epigrams; his *Parerga*; and his *Muse Angliæ*, or commendatory Verses upon persons of rank in church and state at that time.

JOIGNY, a town of France, in Champagne, and in the diocese of Sens, with a very handsome castle. It consists of three parishes, and is pleasantly situated on the river Yonne, in E. Long. 3. 25. N. Lat. 47. 56.

JOINERY, the art of working in wood, or of fitting various pieces of timber together. It is called by the French *menuiserie*, "small work," to distinguish it from carpentry, which is employed about large and less curious works.

JOINT, in general, denotes the juncture of two or more things. The joints of the human body are called by anatomists *articulations*. See ANATOMY, n<sup>o</sup> 2.

The suppleness to which the joints may be brought by long practice from the time of infancy, is very surprising. Every common posture-master shows us a great deal of this; but one of the most wonderful instances we ever had of it, was in a person of the name of *Clark*, and famous for it in London, where he was commonly known by the name of *Clerk the posture-master*. This man had found the way, by long practice, to distort many of the bones, of which nobody before had ever thought it possible to alter the position. He had such an absolute command of his muscles and joints, that he could almost disjoint his whole body; so that he once imposed on the famous Mullens by his distortions, in such a manner, that he refused to undertake his cure: but, to the amazement of the physician, no sooner had he given over his patient, than he saw him restore himself to the figure and condition of a proper man, with no distortion about him.

JOINTURE, in law, generally signifies a settlement of lands and tenements, made on a woman in consideration of marriage.

JOINVILLE (John Sire de), an eminent French statesman of the 13th century, who was seneschal of  
high<sup>r</sup>

Joigny  
||  
Joinville.

**Joinville** high-steward of Champagne, and one of the principal lords in the court of Lavis IX. He attended that monarch in all his expeditions; and had so much confidence placed in him, that all matters of justice in the palace were referred to his decision, and the king undertook nothing of consequence without consulting him. He wrote the history of St Lewis in French, which is a very curious and interesting piece; and died about the year 1318. The best edition of this work is that of Du Cange, in folio, with learned remarks.

**JOINVILLE**, an ancient and considerable town of France, in Champagne, with the title of a principality, and a large magnificent castle. It is situated on the river Marne, in E. Long. 5. 10. N. Lat. 48. 20.

**JOISTS**, or **JOYSTS**, in architecture, those pieces of timber framed into the girders and summers, on which the boards of the floor are laid.

**JOKES**. See **JESTING**.

**IOLAIA**, a festival at Thebes, the same as that called **Heraclia**. It was instituted in honour of Hercules and his friend Iolas, who assisted him in conquering the hydra. It continued during several days, on the first of which were offered solemn sacrifices. The next day horse-races and athletic exercises were exhibited. The following day was set apart for wrestling, the victors were crowned with garlands of myrtle generally used at funeral solemnities. They were sometimes rewarded with tripods of brass. The place where the exercises were exhibited was called **Iolaion**; where there were to be seen the monument of Amphitryon and the cenotaph of Iolas, who was buried in Sardinia. These monuments were strewed with garlands and flowers on the day of the festival.

**IÖLAS** or **IOLAUS**, (fab. hist.) a son of Iphiclus king of Thessaly, who assisted Hercules in conquering the Hydra, and burnt with a hot iron the place where the heads had been cut off, to prevent the growth of others. He was restored to his youth and vigour by Hebe, at the request of his friend Hercules. Some time afterwards Iolas assisted the **HERACLIDÆ** against Eurytheus, and killed the tyrant with his own hand. According to Plutarch, Iolas had a monument in Bœotia and Phœcis, where lovers used to go and bind themselves by the most solemn oaths of fidelity, considering the place as sacred to love and friendship. According to Diodorus and Pausanias, Iolas died and was buried in Sardinia, where he had gone to make a settlement at the head of the sons of Hercules by the 50 daughters of Thespius.

**JOLI**, or **JOLY**. (Claudius), a worthy parish-priest, and an excellent scholar, descended from a family eminent for learning and piety; was born at Paris in 1607. He applied himself first to the law, and pleaded for some time at the bar: but inclining afterwards to the church, he entered into orders, and in 1631 obtained a canonry in the cathedral church of Notre Dame at Paris; the duties of which office he discharged with an exactness beyond all example as long as he lived. Discovering at the same time occasionally a capacity for state-affairs, the duke de Longueville, the French plenipotentiary for negotiating a general peace, took Joly with him to Munster, where he proved a good assistant. On his return, he resumed his former employments with his usual zeal. In 1671 he was

Nº 168.

made precentor in his church; and several times official of Paris, without his seeking; always behaving, as an ecclesiastical magistrate, with perfect integrity, and testifying a sincere love for justice. He died in 1700, and left many works; in which, as in as many mirrors, his true character fully appears.

**JOLI** (Guy), king's counsellor to the Chatelet, and syndic of the revenues of the Hotel de Ville at Paris, attached himself for a long time to cardinal de Retz in the capacity of secretary. Beside other tracts, he wrote *Memoirs* from 1648 to 1665, including those of Cardinal de Retz; a translation of which into English was published in 1755.

**JOLLOXOCHITI**, or **FLOWER OF THE HEART**, in botany; a large beautiful flower growing in Mexico; where it is not less esteemed for its beauty than for its odour, which is so powerful, that a single flower is sufficient to fill a whole house with the most pleasing fragrance. It has many petals, which are glutinous, externally white, internally reddish or yellowish, and disposed in such a manner, that when the flower is open and its petals are expanded, it has the appearance of a star, but when shut it resembles in some measure a heart, from whence its name arose. The tree which bears it is tolerably large, and its leaves are long and rough.

**ION**, (fab. hist.), a son of Xuthus and Creusa daughter of Erechtheus, who married Helice, the daughter of Selinus king of Ægiale. He succeeded to the throne of his father-in-law; and built a city, which he called *Helice* on account of his wife. His subjects from him received the name of *Ionians*, and the country that of *Ionia*. See **IONIA**.

**ION**, a tragic poet of Chios, who flourished about the 82d Olympiad. His tragedies were represented at Athens, where they met with universal applause. He is mentioned and greatly recommended by Aristophanes and Athenæus, &c.

**IONA**, **JONA**, or **ICOLMKILL**, one of the Hebrides; a small, but celebrated island, "once the *luninary* of the Caledonian regions (as Dr Johnson expresses it), whence savage clans and roving barbarians derived the benefits of knowledge and the blessings of religion." The name *Iona* is derived from a Hebrew word signifying a *dove*, in allusion to its patron Columba, who landed here in 565. See **COLUMBA**.—It is said to have been a seat of the druids before his arrival, when its name in Irish was *Inis Drunish*, or the "Druid Island." The druids being expelled or converted, he founded here a cell of canons regular, who till 716 differed from the church of Rome in the observance of Easter and in the tonsure. After his death, the island retained his name, and was called *T'columb cill* or "Columb's cell," now *Icolmkill*. The Danes dislodged the monks in the 9th century, and Cluniacs were the next order that settled here.

This island, which belongs to the parish of Ross in Mull, is three miles long, and one broad: the east side is mostly flat; the middle rises into small hills; and the west side is very rude and rocky: the whole forming a singular mixture of rock and fertility. There is in the island only one town, or rather village, consisting of about 60 mean houses. Near the town is the bay of Martyrs slain by the Danes. An oblong inclosure, bounded by a stone dyke and called *Clachnan Druinach*,

*Druinach*, in which bones have been found, is supposed to have been a burial-place of the Druids, or rather the common cemetery of the towns-people. Beyond the town are the ruins of the nunnery of Auflin cano-nesses, dedicated to St Oran, and said to be founded by Columba: the church was 58 feet by 20, and the east roof is entire. On the floor, covered deep with cow-dung, is the tomb of the last prioress with her figure praying to the Virgin Mary, and this inscription on the ledge: *Hic jacet domina Anna Donaldi Terleti filia, quondam priorissa de Jona, quæ obiit an'o m<sup>o</sup> d<sup>o</sup> xi<sup>mo</sup> ejus animam Altissimo commendamus:* and another inscribed, *Hic jacet Mariota filia Joban: Lauchlain domini de. . . .* A broad paved way leads hence to the cathedral; and on this way is a large handsome cross called *Maclean's*, the only one that remains of 360, which were demolished here at the Reformation. Reilig Ouran, or the burying-place of Oran, is the large inclosure where the kings of Scotland, Ireland, and of the isles, and their descendants, were buried in three several chapels. The dean of the isles, who travelled over them 1549, and whose account has been copied by Buchanan, and published at Edinburgh 1784, says, that in his time on one of these chapels (or "tombs of stain formit like little chapels with ane braid gray maible or quilin stain on the gavel of ilk ane of the tombs," containing, as the chronicle says, the remains of 48 Scotch monarchs, from Fergus II. to Macbeth, 16 of whom were pretended to be of the race of Alpin), was inscribed, *Tumulus regum Scotiæ.* The next was inscribed, *Tumulus regum Hiberniæ,* and contained four Irish monarchs: and the 3d inscribed, *Tumulus regum Norægiæ,* contained eight Norwegian princes or viceroys of the Hebrides, while they were subject to the crown of Norway. Boetius says, that Fergus founded this abbey for the burial-place of his successors, and caused an office to be composed for the funeral ceremony. All that Mr Pennant could discover here were only certain slight remains, built in a ridged form and arched within, but the inscriptions lost. These were called *Jornaire nan righ* or "the ridge of the kings." Among these stones are to be seen only these two inscriptions in the Gaelic or Erse language and ancient Irish characters: *Cros Dombail sa' asch,* i. e. "the cross of Donald Longshanks" and that of *Urbvine o Guin;* and another inscribed *Hic jacet quatuor priores de Ily, Johannes, Hugenius, Patricius, in decretis olim bacularius, qui obiit an. Dom. milles<sup>mo</sup> quingentesimo.* Above 300 inscriptions were collected here by Mr Sacheverel in 1688, and given to the earl of Argyll, but afterwards lost in the troubles of the family. The place is in a manner filled with grave-stones, but so over-grown with weeds, that few or none are at present to be seen, far less any inscriptions read. Here also stands the chapel of St Oran, the first building begun by Columba, which the evil spirits would not suffer to stand till some human victim was buried alive; for which service Oran offered himself, and his red grave-stone is near the door. In this chapel are tombs of several chiefs, &c. A little north-west of the door is the pedestal of a cross: on it are certain stones that seem to have been the supports of a tomb. Numbers who visit this island think it incumbent on them to turn each of these thrice round, according to the course of the sun.

VOL. IX. Part I.

They are called *Clacha-brath*; for it is thought that the *brath*, or end of the world, will not arrive till the pedestal on which they stand is worn through. Originally (says Mr Sacheverel) here were three noble globes of white marble, placed on three stone basons, and these were turned round; but the synod ordered them and 60 crosses to be thrown into the sea. The present stones are probably substituted in place of these globes. The precinct of these tombs was held sacred, and enjoyed the privileges of a girth or sanctuary. These places of retreat were by the ancient Scotch law, not to shelter indiscriminately every offender, as was the case in more bigotted times in Catholic countries; for here all atrocious criminals were excluded; and only the unfortunate delinquent, or the penitent sinner, was shielded from the instant stroke of rigorous justice. A little to the north of this inclosure stands the cathedral, built in form of a cross, 115 feet long by 23, the transept 70 feet: the pillars of the choir have their capitals charged with scripture and other histories; and near the altar are the tombs of two abbots and a knight. A fragment remains of the altar-stone of white marble veined with grey. This church is ascribed to Maldwin in the 7th century; but the present structure is far too magnificent for that age. Most of the walls are built of red granite from the Nun's island in the Sound. Two parallel walls of a covered way about 12 feet high and 10 wide, reach from the south-east corner to the sea. In the church-yard is a fine cross of a single piece of red granite, 14 feet high, 22 broad, and 10 inches thick. Near the south-east end is Mary's chapel. The monastery is behind the chapel; of which only a piece of the cloisters remains, and some sacred black stones in a corner, on which contracts and alliances were made, and oaths sworn. East of it was the abbot's gardens and offices. North of this was the palace of the bishop of the isles after the separation of Man from them. This see was endowed with 13 islands; several of which were frequently taken away by the chieftains. The title of *Soder*, which some explained *Soter*, *Sator* "the name of Christ, or Soder, an imaginary town," is really derived from the distinction of the diocese into the northern islands or Nordereys (*i. e.* all to the north of Adnamurchan point), and the Southern or Sudereys; which last being the most important, the isle of Man retained both titles.

Other ruins of monastic buildings and offices may be traced, as well as some druidical sepulchral remains. Several abbeys were derived from this, which with the island was governed by an abbot-prefbyter, who had rule even over bishops. The place where Columba landed is a pebbly beach, where a heap of earth represents the form of his ship. Near it is a hill with a circle of stones called *Cnoc-nar-aimgeal*, or "the hill of angels," with whom the saint held conference; and on Michaelmas day the inhabitants coured their horses round it, a remain of the custom of bringing them there to be blessed. In former times, this island was the place where the archives of Scotland and many valuable old manuscripts were kept. Of these most are supposed to have been destroyed at the Reformation; but many, it is said, were carried to the Scotch college at Douay in France, and it is hoped some of them may still be recovered. This once illustrious seat of learning and

Jonah  
||  
Jones

piety has now no school for education, no temple for worship, no instructor in religion, unless visited by the parish minister from another island.

JONAH, or *Prophecy of JONAH*, a canonical book of the Old Testament; in which it is related, that Jonah (about 771 B. C.) was ordered to go and prophecy the destruction of the Ninevites, on account of their wickedness. But the prophet, instead of obeying the divine command, embarked for Tarshish; when, a tempest arising, the mariners threw him into the sea: he was swallowed by a great fish; and after being three days and nights in his belly, was cast upon the land. Hereupon being sensible of his past danger and surprising deliverance, he betook himself to the journey and embassy to which he was appointed; and arriving at Nineveh the metropolis of Assyria, he, according to his commission, boldly laid open their sins and mis-carriages, and proclaimed their sudden overthrow: upon which the whole city, by prayer and fasting, and a speedy repentance, happily averted the divine vengeance, and escaped the threatened ruin. Jonah upon this, fearing to pass for a false prophet, retired to a hill at some distance from the city; where God, by a miracle, descended to show him the unreasonableness of his discontent.

JONAS (Julius), a Protestant divine, born at Northhausen, in Thuringia, in 1493. He was one of Luther's most zealous disciples. He contracted a strict friendship with Melancthon; became principal of the college of Wittenburg, and afterwards dean of the university of that city. He wrote a treatise in favour of the marriage of priests, and other works; and died in 1555.

JONAS (Arnagrímus), a learned Icclander, acquired great reputation by his skill in the sciences, and particularly in astronomy. He was coadjutor to Gundebrand de Thorlac, bishop of Holar, in Iceland. He refused that bishopric, after the death of Gundebrand; and died in 1649. He wrote several works; the principal of which are, *Idea vera Magistratús*, and his history and description of Iceland.

JONATHAN, the son of Saul, celebrated in sacred history for his valour, and his friendship for David against the interest of his own house. Slain in battle 1055 B. C.

JONATHAN Maccabeus, brother of Judas, a renowned general of the Jews. He forced Bacchides the Syrian general, who made war with the Jews, to accept a peace; conquered Demetrius Soter, and afterwards Apollonius, that prince's general; but, being ensnared by Tryphon, was put to death 144 B. C.

JONES (Inigo), a celebrated English architect, was the son of a cloth-worker of London, and was born in 1572. He was at first put apprentice to a joiner; but early distinguished himself by his inclination to drawing or designing, and was particularly taken notice of for his skill in landscape painting. This afterwards recommended him to the favour of William earl of Pembroke, who sent him abroad with a handsome allowance in order to perfect himself in that branch. He was no sooner at Rome, than he found himself in his proper sphere: he felt that nature had not formed him to decorate cabinets, but to design palaces. He dropt the pencil and conceived Whitehall. In the state of Venice he saw the works of Palladio,

and learned how beautiful taste may be exerted on a less theatre than the capital of an empire. How his abilities distinguished themselves in a spot where they certainly had no opportunity to act, we are not told, though it would not be the least curious part of his history; certain it is, that, on the strength of his reputation at Venice, Christian IV. invited him to Denmark, and appointed him his architect; but on what buildings he was employed in that country, we are yet to learn. James I. found him at Copenhagen, and queen Ann took him in the quality of her architect to Scotland. He served prince Henry in the same capacity, and the place of surveyor general of the works was granted to him in reversion. On the death of that prince, with whom at least all his lamented qualities did not die, Jones travelled once more into Italy, and, assisted by ripeness of judgment, perfected his taste. To the interval between these voyages Mr Walpole is inclined to assign those buildings of Inigo, which are less pure, and border too much upon the bastard style, which one may call *king James's gothic*. Inigo's designs of that period are not gothic, but have a littleness of parts, and a weight of ornaments, with which the revival of the Grecian taste was encumbered, and which he shook off in his grander designs. The surveyor's place fell, and he returned to England; and, as if architecture was not all he had learned at Rome, with an air of Roman disinterestedness he gave up the profits of his office, which he found extremely in debt; and prevailed upon the comptroller and paymaster to imitate his example, till the whole arrears were cleared.

In 1620, he was employed in a manner very unworthy of his genius: king James set him upon discovering, that is, guessing, who were the founders of Stonehenge. His ideas were all Romanized; consequently, his partiality to his favourite people, which ought rather to have prevented him from charging them with that mass of barbarous clumshets, made him conclude it a Roman temple.

In the same year Jones was appointed one of the commissioners for the repair of St Paul's; but which was not commenced till the year 1633, when Laud, then bishop of London, laid the first stone, and Inigo the fourth. In the restoration of that cathedral, he made two capital faults. He first renewed the sides with very bad Gothic; and then added a Roman portico, magnificent and beautiful indeed, but which had no affinity with the ancient parts that remained, and made his own Gothic appear ten times heavier. He committed the same error at Winchester, thrusting a screen in the Roman or Grecian taste into the middle of that cathedral. Jones indeed was by no means successful when he attempted Gothic. The chapel of Lincoln's Inn has none of the characteristics of that architecture. The cloyster beneath seems oppressed by the weight of the building above.

The authors of the life of Jones place the erecting of the Banqueting-house in the reign of king Charles; but it appears, from the accounts of Nicholas Stone, that it was begun in 1619, and finished in two years—a small part of the pile designed for the place of our kings; but so complete in itself, that it stands a model of the most pure and beautiful taste. Several plates of the intended palace at Whitehall have been given;

but.

but Mr Walpole thinks, from no finished design. The four great sheets are evidently made up from general hints; nor could such a source of invention and taste as the mind of Inigo ever produce so much fame. The whole fabric, however, was so glorious an idea, that one forgets for a moment (says Mr Walpole), in the regret for its not being executed, the confirmation of our liberties, obtained by a melancholy scene that passed before the windows of that very Banqueting-house.

In 1623 he was employed at Somerset-house, where a chapel was to be fitted up for the Infanta, the intended bride of the prince. The chapel is still in being. The front to the river, part only of what was designed, and the water-gate, were erected afterwards on the designs of Inigo, as was the gate at York-stairs.

On the accession of Charles, Jones was continued in his posts under both king and queen. His fee as surveyor was 8s. 4d. a day, with an allowance of 46l. a-year for house-rent, besides a clerk, and incidental expences. What greater rewards he had, are not upon record.

During the prosperous state of the king's affairs, the pleasures of the court were carried on with much taste and magnificence. Poetry, painting, music, and architecture, were all called in to make them rational amusements. Mr Walpole is of opinion, that the celebrated festivals of Louis XIV were copied from the shows exhibited at Whitehall, in his time the most polite court in Europe. Ben Johnson was the laureat; Inigo Jones the inventor of the decorations; Lanieri and Ferabosco composed the symphonies; the king, the queen, and the young nobility, danced in the interludes. We have accounts of many of those entertainments, called *masques*; they had been introduced by Anne of Denmark. Lord Burlington had a folio of the designs for these solemnities, by Inigo's own hand, consisting of habits, masks, scenes, &c. The harmony of these masks was a little interrupted by a war that broke out between the composers, Inigo and Ben; in which, whoever was the aggressor, the turbulent temper of Johnson took care to be most in the wrong.

The works of Inigo Jones are not scarce; Surgeon's hall is one of his best works. One of the most admired is the Arcade of Covent-garden, and the Church: "Two structures (says Mr Walpole), of which I want taste to see the beauties. In the arcade there is nothing remarkable; the pilasters are as ardent and homely stripes as any plasterer would make. The barn roof over the portico of the church strikes my eyes with as little idea of dignity and beauty, as it could do if it covered nothing but a barn. It must be owned, that the defect is not in the architect, but in the order.—Who ever saw a beautiful Tuscan building? Would the Romans have chosen that order for a temple?" The expence of building that church was 4500l.

Ambresbury in Wiltshire was designed by Jones, but executed by his scholar Webb. Jones was one of the first that observed the same diminution of pilasters as in pillars. Lindsay-house in Lincoln's-Inn Fields, which he built, owes its chief grace to this singularity. In 1618 a special commission was issued to the lord chancellor, the earls of Worcester, Pembroke,

Arundel, and others, to plant and reduce to uniformity, Lincoln's-Inn Fields, as it shall be drawn by way of map, or ground-plot, by Inigo Jones, surveyor-general of the works. That square is laid out with a regard to its trifling a singularity, as to be of the exact dimensions of one of the pyramids: this would have been admired in those ages when the Keep at Kenilworth Castle was erected in the form of an horse-fetter, and the Escorial in the shape of St Laurence's gridiron.

Colehill in Berkshire, the seat of Sir Matthew Pleydell, built in 1650, and Cobham-hall in Kent, were Jones's. He was employed to rebuild Castle Ashby, and finished one front: but the civil war interrupted his progress there and at Stoke-park in Northamptonshire. Shaftsbury-house, now the London Lying-in hospital, on the east side of Aldergate-street, is a beautiful front. The Grange, the seat of the lord chancellor Henley in Hampshire, is entirely of this matter. It is not a large house, but by far one of the best proofs of his taste. The hall, which opens to a small vestibule with a cupola, and the stair-case adjoining, are beautiful models of the purest and most classic antiquity. The gate of Beaufort-garden at Chelsea, designed by Jones, was purchased by lord Burlington, and transported to Chiswick. He drew a plan for a palace at Newmarket; but not that wretched hovel that stands there at present. One of the most beautiful of his works is the Queen's house at Greenwich. The first idea of the hospital is said to have been taken by his scholar Webb, from his papers.

Inigo tasted early the misfortunes of his master. He was not only a favourite, but a Roman Catholic: in 1646, he paid 545l. for his delinquency and sequestration. Whether it was before or after this fine, it is uncertain, that he and Stone the mason buried their joint stock in Scotland-yard; but an order being published to encourage the informers of such concealments, and four persons being privy to the spot where the money was hid, it was taken up, and reburied in Lambeth marsh. Grief, misfortunes, and age, put an end to his life at Somerset-house July 21 1651. Several of his designs have been published by Mr Kent, Mr Colin Campbell, and Mr Haac Ware. He left in MS. some curious notes on Palladio's architecture, which are inserted in an edition of Palladio published in 1714.

IONIA, a country of Asia minor, bounded on the north by Æolia, on the west by the Ægean and Icarian seas, on the south by Caria, and on the east by Lydia and part of Caria. It was founded by colonies from Greece and particularly Attica, by the Ionians or subjects of Ion. Ionia was divided into 12 small states which formed a celebrated confederacy often mentioned by the ancients. These 12 states were Priene, Miletus, Colophon, Clazomenæ, Ephesus, Lebedos, Teos, Phocæa, Erythræ, Smyrna, and the capitals of Samos and Chios. The inhabitants of Ionia built a temple which they called *Pan Ionium* from the concourse of people that flocked there from every part of Ionia. After they had enjoyed for some time their freedom and independence, they were made tributary to the power of Lydia by Cræsus. The Athenians assisted them to shake off the slavery of the Asiatic monarchs; but they soon forgot their duty and relation

Ionic  
||  
Jordano.

tion to their mother-country, and joined Xerxes when he invaded Greece. They were delivered from the Persian yoke by Alexander, and restored to their original independence. They were reduced by the Romans under the dictator Sylla. Ionia has been always celebrated for the salubrity of the climate, the fruitfulness of the soil, and the genius of its inhabitants.

**IONIC ORDER.** See ARCHITECTURE, n<sup>o</sup> 45.

*IONIC Dialect*, in grammar, a manner of speaking peculiar to the people of Ionia.

*IONIC Sect* was the first of the ancient sects of philosophers; the others were the Italic and Eleatic. The founder of this sect was Thales, who, being a native of Miletus in Ionia, occasioned his followers to assume the appellation of *Ionic*: Thales' was succeeded by Anaximander, and he by Anaximenes, both of Miletus; Anaxagoras Clazomenius succeeded them, and removed his school from Asia to Athens, where Socrates was his scholar. It was the distinguishing tenet of this sect, that water was the principle of all natural things.

**IONIUM MARE**, a part of the Mediterranean Sea, at the bottom of the Adriatic. It lies between Sicily and Greece. That part of the *Ægean sea* which lies on the coasts of Ionia in Asia, is called the *Sea of Ionia*, and not the *Ionian Sea*. According to some authors, the Ionian sea receives its name from Io, who swam across there after she had been metamorphosed into a heifer.

**JONK**, or **JONQUE**, in naval affairs, is a kind of small ship, very common in the East Indies. These vessels are about the bigness of our fly-boats; and differ in the form of their building, according to the different methods of naval architecture used by the nations to which they belong. Their sails are frequently made of mats, and their anchors are made of wood.

**JONSTON** (John), a learned Polish naturalist and physician, born in 1603. He travelled all over Europe, and procured esteem every where by his knowledge; afterward he bought the estate of Ziebesdorf in the duchy of Lignitz in Silesia, where he spent the remainder of his days. He wrote a natural history of birds, fish, quadrupeds, insects, serpents, and dragons, in folio; a piece upon the Hebrew and Greek festivals, a thaumatography, and some poems. He died in 1675.

**JOPPA**, a sea-port town in Palestine, lying south of Cæsarea; and anciently the only port to Jerusalem, whence all the materials sent from Tyre towards the building of Solomon's temple were brought hither and landed, (2 Chr. ii. 16.) It is said to have been built by Japhet, and from him to have taken its name *Japho*, afterwards moulded into *Joppa*; and the very heathen geographers speak of it as built before the flood. It is now called *Jassa*, somewhat nearer to its first appellation, and is but in a poor and mean condition.

**JOR**, the Hebrew for a river, which, joined with Dan, concurs to form the term *Jordan*. See DAN.

**JORDANO** (Luca), an eminent Italian painter, was born at Naples in 1632. He became very early a disciple of Joseph Ribera; but going afterwards to Rome, he attached himself to the manner of Pietro da Cortona, whom he assisted in his great works. Some of his pictures being seen by Charles II. king of

Spain, he engaged him in painting the Escorial; in which task he acquitted himself as a great painter. The king showed him a picture of Bassani, expressing his concern that he had not a companion: Luca painted one so exactly in Bassani's manner, that it was taken for a performance of that master; and for this service he was knighted, and gratified with several honourable and valuable employments. The great works he executed in Spain, gave him still greater reputation when he returned to Naples; so that though he was a very quick workman, he could not supply the eager demands of the citizens. No one, not even Tintoret, ever painted so much as Jordano; and his generosity carried him so far as to present altar-pieces to churches that were not able to purchase them. His labours were rewarded with great riches; which he left to his family, when he died, in 1705.

**JORDANS** (James), one of the most eminent painters of the Flemish school, was born at Antwerp in 1593. He learned the principles of his art from Adam Van Ort, whose daughter he married; which connection hindered him from gratifying his inclination of visiting Italy. He improved most under Rubens; for whom he worked, and from whom he drew his best principles: his taste directed him to large pieces; and his manner was strong, true, and sweet. A great number of altar-pieces painted by him are preserved in the churches in the Netherlands, which maintain the reputation of this artist. He died in 1678.

**JORTIN** (John), a very learned and ingenious English clergyman, was born in Huntingdonshire, about the year 1701. Having some private fortune of his own, and being of a peculiar disposition that could not solicit promotion, he remained long without preferment. In 1738, lord Wincheſter gave him the living of Eastwell in Kent; but the place not agreeing with his health, he soon resigned it. Archbishop Herring, who had a great value for him, about the year 1751 presented him to the living of St Dunstan's in the East; and bishop Osbalditon in 1762 gave him that of Kensington, with a prebend in St Paul's cathedral, and made him archdeacon of London. His temper, as well as his aspect, was rather morose and saturnine; but in company that he liked, he was at all times facetious, yet still with a mixture of *sal cenſura ſuperiorum*. His sermons were sensible and argumentative; and would have made more impression on his hearers, had he been more attentive to the advantages flowing from a good delivery: but he appeared to greater advantage as a writer. His remarks on ecclesiastical history, his six dissertations, his life of Erasmus, and his sermons, were extremely well received by the public, and have undergone several editions. He died in the year 1770.

**JOSEPH**, the son of Jacob; memorable for his chastity, and the honours conferred on him at the court of Egypt, &c. He died in 1635 B. C. aged 110.

**JOSEPHUS**, the celebrated historian of the Jews, was of noble birth, by his father Mattathias descended from the high-priests, and by his mother of the blood-royal of the Maccabees; he was born A. D. 37, under Caligula, and lived under Domitian. At 16 years of age he betook himself to the sect of the Essenes, and then to the Pharisees; and having been successful in a journey

journey to Rome, upon his return to Judæa he was made captain-general of the Galilæans. Being taken prisoner by Vespasian, he foretold his coming to the empire, and his own deliverance by his means. He accompanied Titus at the siege of Jerusalem, and wrote his "Wars of the Jews," which Titus ordered to be put in the public library. He afterwards lived at Rome, where he enjoyed the privileges of a Roman citizen, and where the emperors loaded him with favours, and granted him large pensions. Besides the above work, he wrote, 1. Twenty books of Jewish antiquities, which he finished under Domitian. 2. Two books against Appian. 3. An elegant discourse on the martyrdom of the Maccabees. 4. His own life. These works are excellently written in Greek.

JOSHUA, the renowned general of the Jews, who conducted them through the wilderness, &c. died in 1424 B. C. aged 110.

JOSHUA, a canonical book of the Old Testament, containing a history of the wars and transactions of the person whose name it bears. This book may be divided into three parts: the first of which is a history of the conquest of the land of Canaan; the second, which begins at the 12th chapter, is a description of that country, and the division of it among the tribes; and the third, comprised in the two last chapters, contains the renewal of the covenant he caused the Israelites to make, and the death of their victorious leader and governor. The whole comprehends a term of 17, or, according to others, of 27 years.

JOSIAH, king of Judah; the destroyer of idolatry, and the restorer of the true worship, an excellent magistrate, and a valiant general, was slain in battle, 609 B. C.

JOTAPATA (anc. geog.), a town of the Lower Galilee, distant 40 stadia from Gabara; a very strong place, situated on a rock, walled round, and encompassed on all hands with mountains, so as not to be seen but by those who came very near. It was with great difficulty taken by Vespasian, being defended by Josephus, who commanded in it; when taken, it was ordered to be razed.

JOUBERT (Lawrence), counsellor and physician to the king of France, chancellor and judge of the university of Montpellier, was born at Valance in Dauphiny in 1530. He became the disciple of Rondelet at Montpellier; and at his death succeeded to the regius professorship of that university, where he had given abundant proofs of his merit, and strengthened his reputation by the lectures he read in that capacity, as well as by the works he published. Henry III. who passionately wished to have children, sent for him to Paris, in hopes by his assistance to render his marriage fruitful; but he was disappointed, without any loss of repute to Joubert. Much offence was indeed taken at a piece he published under the title of *Vulgar errors*, in which he treated of virginity and generation more plainly than had ever before been done in the French language. But, though he had promised something more on the same subject, he was so piqued at the clamour raised against it, that the public saw no more, of six parts promised, than the first, and part of the second, though they were greatly called for. He died in 1582; and his son Isaac translated some of his Latin paradoxes into French.

JOVIAN, the Roman emperor, elected by the army, after the death of Julian the apostate, in 363. He at first refused, saying he would not command idolatrous soldiers; but, upon an assurance that they would embrace Christianity, he accepted the throne, and immediately shut all the Pagan temples, and forbid their sacrifices. But he did not long enjoy the dignity to which his merit had raised him; being suffocated in his bed by the fumes of a fire that had been made to dry the chamber, in 364, the 3rd of his age, and the eighth month of his reign. See CONSTANTINOPLE, n<sup>o</sup> 67.

JOVIUS (Paul), in Italian *Giovio*, a celebrated historian, was born at Como in Italy, in the year 1483. As his father died in his infancy, he was educated by his eldest brother Benedict Jovius, under whom he became well skilled in classical learning; and then went to Rome, for the sake of enjoying the benefit of the Vatican library. He there wrote his first piece, *De pijsibus Romanis*, which he dedicated to cardinal Lewis of Bourbon. He received a pension of 500 crowns for many years from Francis I. king of France, whose favour he secured by his flatteries. But, in the following reign, having disgusted the constable Montmorency, his name was struck out of the list of pensioners. Jovius did not suffer his spirits to sink under his misfortune: he had obtained a high reputation in the learned world by his writings; and having always showed great respect to the house of Medicis, on whose praises he had expatiated in his works, he applied to Clement VII. and obtained the bishoprick of Nocera. His principal piece is his history, which is that of his own time throughout the world, beginning with 1494, and extending to the year 1544. This was the chief business of his life. For he formed the plan of it in the year 1515; and continued upon it till his death, which happened at Florence in 1552. It is printed in three volumes folio. He is allowed to have been a man of wit as well as learning: he was master of a bright and polished style, and has many curious observations; but being a venal writer, his histories are not much credited.

JOURNAL, a day-book, register, or account of what passes daily. See DIARY.

JOURNAL, in Merchants Accounts, is a book into which every particular article is posted out of the waste-book, and made debtor. This is to be very clearly worded, and fairly engrossed. See *Book-Keeping*.

JOURNAL, in navigation, a sort of diary, or daily register of the ship's course, winds, and weather; together with a general account of whatever is material to be remarked in the period of a sea-voyage.

In all sea-journals, the day, or what is called the 24 hours, terminates at noon, because the errors of the dead-reckoning are at that period generally corrected by a solar observation. The daily compact usually contains the state of the weather; the variation, increase, or diminution of the wind; and the suitable shifting, reducing, or enlarging the quantity of sail extended; as also the most material incidents of the voyage, and the condition of the ship and her crew; together with the discovery of other ships or fleets, land, shoals, breakers, foundings, &c.

JOURNAL, is also a name common for weekly essays, news-

Journal newspapers, &c. as the Gray's-Inn journal, the Westminster journal, &c.

Journal  
||  
Ipecacu-  
anha.

JOURNAL, is also used for the titles of several books which come out at stated times, and give abstracts, accounts, &c. of the new books that are published, and the new improvements daily made in arts and sciences; as the *Journal de Savans*, *Journal de Physique*, &c.

JOURNEY, a tract of ground passed over in travelling by land; properly as much as may be passed over in one day.

*Management of a Horse on a JOURNEY.* See HORSE.

JOURNEYMAN, properly one who works by the day only; but the word is now used for any one who works under a master, either by the day, the year, or the piece.

JOUVENET (John), a celebrated French painter, was born at Rouen in 1644; where his father, who was a painter, bred him up to the same profession: but his greatest improvement was confessedly derived from the instructions of Nicholas Poussin, and studying the works of that master. He acquired so good a knowledge of design, as qualified him for employment in several grand works in the palaces at Paris and Trianon; in many of the churches and convents; and in the hospital of invalids, where he painted the twelve apostles, each figure being 14 feet high. He was esteemed to have a ready invention, to be correct in his designs, and to have a taste for grandeur in his compositions: it is observed of this artist, that being deprived of the use of his right hand by a paralytic disorder, he nevertheless continued to paint with his left. He died in the year 1717.

JOY, in ethics, is that passion which is produced by love, regarding its object as present, either immediately or in prospect, in reality or imagination. This passion has been found to increase the PERSPIRATION and urine of human bodies.

JOYNERY. See JOINERY.

IPECACUANHA, in the materia medica, a West-Indian root, of which there are principally two kinds, distinguished by their colour, and brought from different places; but both possessing the same virtues, tho' in a different degree. The one is ash-coloured or grey, and brought from Peru; the other is brown, and is brought from the Brasils: and these are indifferently sent into Europe under the general name of *ipecacuanha*.

These two sorts have been by some supposed to be the roots of two different plants: but, according to others, this is a mistake; the only difference being that one grows in a different place, and in a richer and moister soil, and is better supplied with juices than the other. The plant they belong to is a species of *PSYCHOTRIA*.

The ash-coloured ipecacuan is a small wrinkled root, bent and contorted into a great variety of figures, brought over in short pieces full of wrinkles, and deep circular fissures, quite down to a small white woody fibre that runs in the middle of each piece: the cortical part is compact, brittle, looks smooth and resinous upon breaking: it has very little smell; the taste is bitterish and subacid, covering the tongue as it were with a kind of mucilage. The brown sort is small, and somewhat more wrinkled than the foregoing; of a brown or blackish colour without, and white with-

in. The first sort, the ash coloured or grey ipecacuan, is that usually preferred for medicinal use. The brown has been sometimes observed, even in a small dose, to produce violent effects. A third sort, called the *white* from its colour, has also been distinguished. It is woody, has no wrinkles, and no perceptible bitterness in taste. This, though taken in a large dose, has scarce any effect at all. It is supposed to belong to a species of *VIOLA*. Mr Geoffroy calls this sort *bastard ipecacuan*, and complains that it is an imposition upon the public. Geoffroy, Neumann, Dale, and Sir Hans Sloane, inform us, that the roots of a kind of apocynum (dogs-bane) are too frequently brought over instead of it; and instances are given of ill consequences following from the use of it. But if the marks above laid down, particularly the ash colour, brittleness, deep wrinkles, and bitterish taste, be carefully attended to, all mistakes of this kind may be prevented.

Ipecacuan was first brought into Europe about the middle of last century, and an account of it published about the same time by Piso; but it did not come into general use till about the year 1686, when Helvetius, under the patronage of Louis XIV. introduced it into practice. This root is one of the mildest and safest emetics with which we are acquainted; and has this peculiar advantage, that if it should not operate by vomit, it passes off by the other emunctories. It was first introduced among us with the character of an almost infallible remedy in dysenteries, and other inveterate fluxes, as menorrhagia and leucorrhœa, and also in disorders proceeding from obstructions of long standing: nor has it lost much of its reputation by time. In dysenteries, it almost always produces happy effects, and often performs a cure in a very short space of time. In other fluxes of the belly, in beginning dysenteries, and such as are of a malignant kind, or where the patient breathes a tainted air, it has not been found equally successful: in these cases it is necessary to continue the use of this medicine for several days, and to join with it opiates, diaphoretics, and the like. This root, given in substance, is as effectual, if not more so, than any of the preparations of it: the pure resin acts as a strong irritating emetic, but is of little service in dysenteries; while an extract prepared with water is almost of equal service in these cases with the root itself, though it has little effect as an emetic. Geoffroy concludes from hence, that the chief virtue of ipecacuan in dysenteries depends upon its gummy substance, which lining the intestines with a soft mucilage, when their own mucus has been abraded, occasions their exulcerations to heal, and defends them from the acrimony of the juices: and that the resinous part, in which the emetic quality resides, is required, where the morbid matter is lodged in the glands of the stomach and intestines. But if the virtues of this root were entirely owing to its mucilaginous or gummy part, pure gums, or mucilages, might be employed to equal advantage. Water, assisted by a boiling heat, takes up from all vegetables a considerable portion of resinous along with the gummy matter: if the ipecacuan remaining after the action of water be digested with pure spirit, it will not yield half so much resin as at first: so that the aqueous extract differs from the crude root only in degree, being proportionably less resinous

Ipeca-  
anha

refinous, and having less effect, both as an emetic, and in the cure of dysenteries. The virtues of ipecacuan, in this disorder, depend upon its promoting perspiration, the freedom of which is here of the utmost importance, and an increase of which, even in healthful persons, is generally observed to suppress the evacuation by stool. In dysenteries, the skin is for the most part dry and tense, and perspiration obstructed: the common diaphoretics pass off without effect through the intestinal canal: but ipecacuan, if the patient after a puke or two be covered up warm, brings on a plentiful sweat. After the removal of the dysentery, it is necessary to continue the use of the medicine for some time longer, in order to prevent a relapse; for this purpose, a few grains divided into several doses, so as not to occasion any sensible evacuation, may be exhibited every day; by this means the cure is effectually established. And indeed small doses given, even from the beginning, have been often found to have better effects in the cure of this disease than larger ones. Geoffroy informs us from his own experience, that he has observed ten grains of the powder to act as effectually as a scruple or two; and therefore confines the dose betwixt six and ten grains: it has lately been found, that even smaller doses prove sufficiently emetic. The only officinal preparation of this root is a tincture made in wine, which accordingly has now the appellation of *winum ipecacuanbæ*, both in the London and Edinburgh pharmacopœias.

Many ingenious experiments have been made on the subject of ipecacuan by Dr Irving, for which he obtained the prize medal of the Harveian Society at Edinburgh for 1784. He has ascertained, that while this root contains a gummy resinous matter, yet that the gummy exerts in a much greater proportion than the resinous part; that the gummy part is much more powerfully emetic than the resinous; that although the cortical part of the root be more active than the ligneous, yet that even the pure ligneous part possesses a considerable emetic power; and that the whole of the root possesses considerable influence, both as an antiseptic and astringent. To determine whether the emetic power of ipecacuan was of a volatile or fixed nature, Dr Irving subjected it to distillation. The water obtained by distillation was found to have very little influence; but the decoction which remained in the still, not only operated violently as an emetic, but produced rigours, cold sweats, and other alarming symptoms. By long continued boiling, the activity of the root itself is almost totally destroyed; but Dr Irving found, that the emetic property of ipecacuan was most effectually counteracted by means of the acetous acid, inasmuch that thirty grains of the powder taken in two ounces of vinegar produced only some loose stools.

Ipecacuan, particularly in the state of powder, is now advantageously employed in almost every disease in which full vomiting is indicated; and when combined with opium under the form of the *pulvis sudorificus*, it furnishes us with the most useful and active sweating medicine which we possess. It is also often given with advantage in very small doses, so as neither to operate by vomiting purging, nor sweating.

The full dose of the powder is a scruple or half a dram, and double that in form of watery infusion. The full dose is recommended in the paroxysm of

spasmodic asthma, and a dose of three or four grains every morning in habitual asthmatic indisposition. A dose of  $\frac{1}{4}$  or  $\frac{1}{2}$  grain rubbed with sugar, and given every four hours or oftener, is recommended in uterine hæmorrhagy, cough, pleurisy, hæmoptoe, &c. and has often been found highly serviceable.

IPHIGENIA, a daughter of Agamemnon and Clytemnestra. When the Greeks going to the Trojan war were detained by contrary winds at Aulis, they were informed by one of the soothsayers, that to appease the gods they must sacrifice Iphigenia Agamemnon's daughter to Diana. The father, who had provoked the goddess by killing her favourite stag, heard this with the greatest horror and indignation, and rather than to shed the blood of his daughter, he commanded one of his heralds, as chief of the Grecian forces, to order all the assembly to depart each to his respective home. Ulysses and the other generals interceded, and Agamemnon consented to immolate his daughter for the common cause of Greece. As Iphigenia was tenderly loved by her mother, the Greeks sent for her on pretence of giving her in marriage to Achilles. Clytemnestra gladly permitted her departure, and Iphigenia came to Aulis. Here she saw the bloody preparations for the sacrifice. She implored the forgiveness and protection of her father; but tears and entreaties were unavailing. Calchas took the knife in his hand; and as he was going to strike the fatal blow, Iphigenia suddenly disappeared, and a god of uncommon size and beauty was found in her place for the sacrifice. This supernatural change animated the Greeks, the wind suddenly became favourable, and the combined fleet set sail from Aulis.

IPICRAËTES, general of the Athenians, had that command conferred upon him at 20 years of age, and became famous for the exactness of his military discipline. He made war on the Thracians; restored Sentes, who was an ally of the Athenians; attacked the Lacedæmonians; and, on many other occasions, gave signal proofs of his conduct and courage. Many ingenious repartees have been mentioned of this general: a man of good family with no other merit than his nobility, reproaching him one day for the meanness of his birth, he replied, "I shall be the first of my race, and thou the last of thine." He died 350 B. C.

IPOMEA, QUAMOILIT, or *Scarlet Convolvulus*: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 29th order, *Campanaceæ*. The corolla is funnel-shaped; the stigma round-headed; the capsule trilobular. There are several species; but not more than one, (the coccinea), cultivated in our gardens. This hath long, slender, twining stalks, rising upon support six or seven feet high. The leaves are heart-shaped, pointed, and angulated at the base, and from the sides of the stalks and branches arise many slender footstalks; each supporting several large and beautiful funnel-shaped and scarlet flowers. There is a variety with orange coloured flowers. Both of them are annual, rising from seed in spring, flowering in July and August, ripening their seeds in September and October, and totally perishing in a short time after. They are tender, and must be brought up in a hot-bed till the latter end of May or beginning of

June, when they may be planted out to adorn the borders, or some may be planted in pots to move occasionally to adorn any particular place; but in either case, there must be sticks for them to twine upon.

IPSWICH, the capital of the county of Suffolk in England, seated in E. Long. 1. 6. N. Lat. 52. 12. The name comes from the Saxon *Gyfeſwīck*, that is, a town situated upon the Gyppen, now called *Orwell*. It had once 21 churches, but now has only 12. It was plundered by the Danes in 991, and afterwards besieged by king Stephen. It had charters and a mint in the reign of king John, but its last charter was from Charles II. The remains of a wall and six or seven religious houses are still to be seen. Though it is not in so flourishing a state as formerly when the harbour was more commodious, yet it is still a large well-built town. Besides the churches already mentioned, it has several meeting-houses, two chapels, a town-hall, council-chamber, a large market-place with a cross in the middle of it, a shire-hall for the county sessions, a library, several hospitals, a free-school, a handsome stone-bridge over the river, stately shambles in the market-place built by cardinal Wolsey, who was a native of the town and a butcher's son, and who also began to build a college here on the ruins of a small college of black canons, which still bears his name, though it was never finished. Here are also several alms-houses, three charity-schools, and a convenient key and custom-house. By virtue of Charles II.'s charter, the town is governed by two bailiffs, a recorder, 12 portmen, of whom the bailiffs are two, a town-clerk, two coroners, and 24 common-council. The bailiffs and 4 of the portmen are justices of the peace. The town enjoys a great many privileges, as passing fines and recoveries, trying criminal, and even crown and capital causes among themselves, settling the assize of bread, wine, and beer. No freeman is obliged to serve on juries out of the town, or bear any office for the king, except that of the sheriff, or to pay tolls or duties in any other part of the kingdom. They have an admiralty jurisdiction beyond Harwich on the Essex coast, and on both sides the Suffolk coast, by which they are intitled to all goods cast on shore. The bailiffs even hold an admiralty-court beyond Landguard-fort. By a trial in king Edward III.'s time, it appears that the town had a right to the custom-duties for all goods coming into Harwich-haven. They claim a right also to all waives and strays, &c. The manufactures of the town are chiefly woollen and linen cloth. It has still a considerable foreign trade. The tide rises pretty high, and brings great ships within a small distance of the town. They export a great deal of corn to London, and sometimes to Holland. Formerly, they had a great trade in ship-building; but that having declined, they now send great quantities of timber to the king's yard at Chatham. It has several great fairs for cattle, cheese, and butter; and is admirably situated for the trade to Greenland, because the same wind that carries them out of the river will carry them to Greenland. It is worth remarking, that it is one of the best places in England for persons in narrow circumstances, house-rent being easy, provisions cheap and plentiful, the passage by land or water to London, &c. convenient.

N<sup>o</sup> 168.

nient, and the company of the place good. It gives title of viscount, as well as Thetford, to the duke of Grafton; and sends two members to parliament.

IRASCIBLE, in the old philosophy, a term applied to an appetite or a part of the soul, where anger and the other passions, which animate us against things difficult or odious, were supposed to reside.

Of the eleven kinds of passions attributed to the soul, philosophers ascribe five to the irascible appetite; viz. wrath, boldness, fear, hope, and despair: the other six are charged on the concupiscible appetite, viz. pleasure, pain, desire, aversion, love, and hatred.

Plato divided the soul into three parts; the reasonable, irascible, and concupiscible parts. The two last, according to that philosopher, are the corporeal and mortal parts of the soul, which give rise to our passions.

Plato fixes the seat of the irascible appetite in the heart; and of the concupiscible in the liver; as the two sources of blood and spirits, which alone affect the mind.

IRELAND, one of the Britannie islands, situated between the 5th and 10th degrees of west longitude, and between the 51st and 56th of north latitude, extending in length about 300 miles, and about 150 in breadth.

The ancient history of this island is involved in so much obscurity, that it has been the object of contention among the antiquarians for upwards of a century and an half. The Irish historians pretend to very great antiquity. According to them, the island was first inhabited about 322 years after the flood. At that time Partholanus the son of Scara landed in Munster on the 14th of May with 1000 soldiers, and some women, from Greece. This voyage he had undertaken on account of his having killed his father and mother in his native country. The same historians inform us, that a great number of lakes broke out in Ireland during the reign of Partholanus, which had no existence when he came into the island, with many other particulars not worth mentioning; but the most surprising circumstance is, that about 300 years after the arrival of this Grecian colony, all of them perished by a plague, not a single person remaining to tell the fate of the rest; in which case, it is wonderful how the catastrophe should have been known.

After the extinction of this first colony, Ireland remained a perfect wilderness for 30 years; when another colony arrived from the east, under the direction of one Nemedius. He set sail from the Euxine sea with 30 transports, each manned with 40 heroes; and at last arrived on the coasts of Ireland, after a very tedious and strange navigation. During his reign also many lakes were formed in the country, which had no existence before; the most material circumstance, however, was an unsuccessful war in which he was engaged with some African pirates, who in the end enslaved his people. The victors proved such insupportable tyrants, that the Irish found themselves under a necessity of quitting the island altogether. They embarked on board a fleet of 1130 ships, under the command of three grandsons of Nemedius, viz. Simon Breac, To Chath, and Briatan Maol. The first returned to Greece, the second sailed to the northern parts of Europe,

rope, and the third landed in the north of Scotland, and from him the island of Britain is said to have taken its name, and the Welsh their origin.

About 216 years after the death of Nemodius, the descendants of Simon Breac returned from Greece into Ireland. They were conducted by five princes of great reputation, who divided the island into five kingdoms, nearly equal in size. These kingdoms were called *Munster*, *Deinstor*, *Connaught*, *Meath*, and *Ulster*; and the subjects of these kings are called by the Irish historians *Firbolgs*.

The Firbolgs were in process of time expelled or totally subdued, after the loss of 100,000 men in one battle, by the *Tuath de Dannans*, a nation of necromancers who came from Attica, Bœotia, and Achaia, into Denmark; from Denmark to Scotland; and from Scotland to Ireland. These necromancers were so completely skilled in their art, that they could even restore the dead to life, and bring again into the field those warriors who had been slain the day before. They had also some curiosities which possessed a wonderful virtue. These were a sword, a spear, a cauldron, and a marble chair; on which last were crowned first the kings of Ireland, and afterwards those of Scotland. But neither the powerful virtues of these Danish curiosities, nor the more powerful spells of the magic art, were able to preserve the *Tuath de Dannans* from being subdued by the Gadelians when they invaded Ireland.

The Gadelians were descended from one Gathelus, from whom they derived their name. He was a man of great consequence in Egypt, and intimately acquainted with Moses the Jewish legislator. His mother was Scota, the daughter of Pharaoh, by Nihal the son of a Scythian monarch cotemporary with Nimrod. The Gadelians, called also *Scots*, from Scota above-mentioned, conquered Ireland about 1300 B. C. under Heber and Heremon, two sons of Milesius king of Spain, from whom were descended all the kings of Ireland down to the English conquest, and who are therefore styled by the Irish historians princes of the *Milesian race*.

From this period the Irish historians trace a gradual refinement of their countrymen from a state of the grossest barbarity, until a monarch, named *Ollam Follá*, established a regular form of government, erected a grand seminary of learning, and instituted the *Fes*, or triennial convention of provincial kings, priests, and poets, at Fearmor or Tarah in Meath, for the establishment of laws and regulation of government. But whatever were the institutions of this monarch, it is acknowledged that they proved insufficient to withstand the wildness and disorder of the times. To Kimbath, one of his successors, the annalists give the honour of reviving them, besides that of regulating Ulster, his family province, and adorning it with a stately palace at Eamannia near Armagh. His immediate successor, called *Hugony*, is still more celebrated for advancing the work of reformation. It seems, that, from the earliest origin of the Irish nation, the island had been divided into the five provincial kingdoms above-mentioned, and four of these had been subject to the fifth, who was nominal monarch of the whole island. These four, however, proved such obstinate disturbers of the peace, that Hugony, to break their power,

parcelled out the country into 25 dynasties, binding them by oath to accept no other monarch but one of his own family. This precaution proved ineffectual. Hugony himself died a violent death, and all his successors for a series of ages were assassinated, scarcely with one exception.

About 100 B. C. the pentarchal government was restored, and is said to have been succeeded by a considerable revolution in politics. The Irish bards had for many ages dispensed the laws, and the whole nation submitted to their decisions; but as their laws were exceedingly obscure, and could be interpreted only by themselves, they took occasion from thence to oppress the people, until at last they were in danger of being totally exterminated by a general insurrection. In this emergency they fled to Convocar-Mac-Nessa, the reigning monarch, who promised them his protection in case they reformed; but at the same time, in order to quiet the just complaints of his people, he employed the most eminent among them to compile an intelligible, equitable, and distinct, body of laws, which were received with the greatest joy, and dignified with the name of *celestial decisions*. These decisions seem to have produced but very little reformation among the people in general. We are now presented with a new series of barbarities, murders, factions, and anarchy; and in this disordered situation of affairs it was, according to the Irish historians, that the chieftain mentioned by Tacitus addressed himself to Agricola, and encouraged him to make a descent on Ireland. This scheme happened not to suit the views of the Roman general at that time, and therefore was not adopted; and so confident are these historians of the strength of their country even in its then distracted state, that they treat the notion of its being subdued by a Roman legion and some auxiliaries (the force proposed to Agricola), as utterly extravagant; acquainting us at the same time, that the Irish were so far from dreading a Roman invasion, that they failed to the assistance of the Picts, and having made a successful incursion into South Britain, returned home with a considerable booty.

In the same state of barbarity and confusion the kingdom of Ireland continued till the introduction of Christianity by St Patrick, about the middle of the fifth century. This missionary, according to the adventures of the Irish antiquity, first introduced letters into Ireland, and thus laid the foundations of a future civilization. On the other hand, the advocates for that antiquity maintain, that the Irish had the knowledge of letters, and had made considerable progress in the arts, before the time of St Patrick; though they allow, that he introduced the Roman character, in which his copies of the Scripture and liturgies were written. To enter into the dispute would be contrary to our plan. It is sufficient to observe, that, excepting by some of the Irish themselves, the history already given is generally reckoned entirely fabulous, and thought to have been invented after the introduction of Christianity. An origin of the Irish nation hath been found out much nearer than Asia, Greece, or Egypt; namely, the island of Britain, from whence it is now thought that Ireland was first peopled. A dispute hath arisen concerning the place from whence the first emigrants from Britain set sail for Ireland. The honour

Ireland.

of being the mother-country of the Irish hath been disputed between the North and South Britons. Mr Macpherfon has argued strenuously for the former, and Mr Whitaker for the latter. For an account of their dispute, however, we must refer to the works of these gentlemen. Mr Whitaker claims the victory, and challenges to himself the honour of being the first who clearly and truly demonstrated the origin of the Irish.

2  
Early history of Ireland by Mr Whitaker.

The name of Ireland, according to Mr Whitaker, is obviously derived from the word *Jar* or *Eir*, which in the Celtic language signifies "west." This word was sometimes pronounced *Iver*, and *Hiver*; whence the names of *Iris*, *Ierna*, *Juverna*, *Iverna*, *Hibernia*, and *Ireland*; by all of which it hath at some time or other been known.

About 350 B. C. according to the same author, the Belgæ crossed the channel, invaded Britain, and seized the whole extended line of the southern coast, from Kent to Devonshire. Numbers of the former inhabitants, who had gradually retired before the enemy, were obliged at last to take shipping on the western coast of England, and passed over into the uninhabited isle of Ireland. These were afterwards joined by another body of Britons driven out by the Belgæ under Divitiacus, about 100 B. C. For two centuries and a half afterwards, these colonies were continually reinforced with fresh swarms from Britain; as the populousness of this island, and the vicinity of that invited them to settle in the one, or the bloody and successive wars in Britain during this period naturally induced them to relinquish the other: and the whole circuit of Ireland appears to have been completely peopled about 150 years after Christ: and as the inhabitants had all fled equally from the dominion of the Belgæ, or for some other cause left their native country, they were distinguished among the Britons by one general and very apposite name, viz. that of *Scuites*, or *Scots*, "the wanderers, or refugees."

3  
Names and situation of the tribes by which it was inhabited.

Mr Whitaker also informs us, "that in the times of the Romans Ireland was inhabited by 18 tribes; by one upon the northern and three on the southern shore, by seven upon the western, six on the eastern, and one in the centre.

"Along the eastern coast, and the Vergivian or internal ocean, were ranged the Damnii, the Voluntii, and the Eblani, the Caucii, the Menapii, and the Coriondii. The first inhabited a part of the two counties of Antrim and Down, extending from Fair-head, the most north-easterly extremity of the island, to Isamnum Promontorium, or the point of Ardglass haven in the county of Down; and having the Logia or Lagan, which falls into Carrickfergus bay, within their possessions, and Dunum or Downpatrick for their capital. The Voluntii possessed the coast from the point of that haven to the river Buvinda or Boyne, the remainder of Down, the breadth of Ardmagh, and all Louth; having the Vinderus or Carlingford river in their dominions, and the town of Laberus near the river Deva (Atherdee in the county of Louth) for their metropolis. And the Eblani reached from the Boyne to the Læhiius, Læv-ui, or Liffy; residing in East Meath, and in the large portion of Dublin county which is to the north of this river; and acknowledging Mediolanum, Eblana, or Dublin, for their principal town. The

Caucii spread from the Liffy to the Letrim, the Oboca of the ancients; had the rest of Dublin county, and such parts of Wicklow as lie in the north of the latter; and owned Dunum or Rath-Downe for their chief city. The Menapii occupied the coast betwixt the Letrim and Cancarne-point, all the rest of Wicklow, and all Wexford to the point; their chief town, Menapia, being placed upon and to the east of Modona, Slanus, or Slane. And the Coriondii inhabited at the back of the Caucii and Menapii, to the west of the Slane and Liffy, and in all Kildare and all Catherlogh; being limited by the Boyne and Barrow on the west, the Eblani on the north, and the Brigantes on the south.

"Upon the southern shore and along the verge of the Cantabrian ocean, lay the Brigantes, the Vodixæ, and the Ibernii. The first owned the rest of Wexford and all Waterford: extending to the Blackwater, Avon-More, or Dabrona, on the south west; having the great mouth of the Barrow with their territories, and Brigantia, Waterford, or some town near it, for their first city; and giving name of *Brigas* to the Suir or Swire, their liminary stream on the north, and the appellation of *Bergie* to their own part of the county of Wexford. The Vodixæ possessed the shire of Corke from the Blackwater to the Ban, the river of Kinsale, and the Dobona or Dubana of the ancients; and affixed the name of *Podium Promontorium* to the point of Ballycotton island. And the Ibernii inhabited the remainder of Corke, and all that part of Kerry which lies to the south-east of Dingle-found; having Ruina or Ibaune for their capital, the Promontorium Aultrinum or Miffen-Head about the middle of their dominions, and the river Ibernus or Dingle found for their northern barrier; and leaving their names to the three divisions of Ibaune, Beare, and Ivetagh.

"Upon the western shore of the island and along the Great Britanic or Atlantic ocean, were the Lucanii or Lucenii, the Velaborii, and the Cangani, the Auterii, the Nagnatæ, the Hardinii, and Venicnii. The Lucenii inhabited the peninsula of land that lies along the river Ibernus or Dingle-found, and perhaps some adjoining parts of Kerry. The Velaborii ranged along the small remainder of the latter, and over the whole of Limerick to the Senus or Shannon; having the Durius or Casheen flowing through their dominions, and Regia, Limeric or some town near it, for their metropolis. And the latter was probably that city near Limerick, the site of which is still famous, and retains the appellation of *Cathair*, or the fortrefs; and where the remains of streets, and other marks of a town, may yet be traced. The Cangani lived in the county of Clare: Macolicum near the Shannon, perhaps Feakle or Melic, being their principal town; a headland in the bay of Galway, near Glaniny, being denominated *Benisamnum Promontorium*; and the adjoining isles of Arran called *Insula Canganae*. The Auterii were settled in the county of Galway; winding along the deep recess of the Sinus Aufoba or bay of Galway; stretching towards the north as far as the Libnius, or the river that bounds the shire in that part; and possessing the small portion of Mayo which lies to the south of it. And these were subject to Auterium, anciently Aterith, and now Athenree; and have left their name to the division of Athenree. The Nagnatæ occupied the rest

of the large county of Mayo, all Sligo and all Roscommon, all Letrim as far as Lough Allin on the south-east, and all Fermanagh to Ballyshannon and Lough Erne; being bounded by the Rhebius or river of Ballyshannon, and the Lake Rhebius or Lough Erne; having a deep bay, called *Magnus Sinus*, that curves along Mayo, Sligo, and Letrim counties; and acknowledging Nagnat, Neemaht, or Alneemaht, the town of the Nagnatæ, for their capital. And the Hardinii and Venicnii were confederated together under the title of the *Venicnian Nations*, extended from Ballyshannon to the North-Cape, and possessed all Donnegalle, except the two whole divisions of Raphoe and Enis-Owen, and the eastern part of Killmacrenen. The Venicnii lay along the immediate margin of the shore, giving name to the Promontorium Venicnium or Cape Horn, and to the Insula Venicnia or North-Arran island. And their metropolis Rheba was seated upon the lake Rhebius, and in the country of the Hardinii on the south-east.

“Upon the northern shore and along the margin of the Deucealedonian ocean, were only the Robogdii; inhabiting the rest of Donnegalle, all Derry, and all Antrim to the Fair-Head, and the Damnii; and giving their own name to the former and the division of Raphoe. And they had the rivers Vidua or Shipharbour, Arigta or Lough Swilly, Darabouna or Lough Foile, and Banna or Ban, in their territories; and acknowledged Robogdium, Robogh. or Raphoe, for their chief city.

“The central regions of the island, all Tyrone, the remainder of Fermanagh and Letrim, all Monaghan, and the rest of Ardmagh; all Cavan, all Longford, and all West-Meath; all the King's and Queen's county, all Kilkenny, and all Tipperary; were planted by the Scoti. The Shannon, Lough Allin, and Lough Erne, were their great boundaries on the west; the Barrow, Boyne, and Lough Neagh, on the east; the Swire and Blackwater on the south; and a chain of mountains on the north. And the two greatest of their towns were Rheba, a city seated, like the Rheba of the Venicnians, upon the lake and river Rhebius, but on a different part of them, and somewhere in the north of Cavan; and Ibernina, a town placed a little to the east of the Shannon, and somewhere in the county of Tipperary.”

But whether we are to receive as truth the accounts given by Mr Whitaker, those of the Irish annalists, or any other, it is certain, that, till little more than a century ago, Ireland was a scene of confusion and slaughter. The Irish historians acknowledge this, as we have already seen. Very few of their monarchs escaped a violent death. The histories of their kings indeed amount to no more than this, viz. that they began to reign in such a year, reigned a certain number of years, and were slain in battle by the valiant prince who succeeded to the throne. The introduction of Christianity seems to have mended the matter very little, or rather not at all. The same wars between the chiefs continued; and the same murders and treacheries took place among the inhabitants, till they were invaded by the Danes or Normans, about the end of the eighth century. At this time, we are told, that the monarchical power was weak, by reason of the factions and assuming disposition of the inferior dyna-

sties; but that the evils of the political constitution had considerably subsided by the respect paid to religion and learning. The first invasions of the Danes were made in small parties for the sake of plunder, and were repelled by the chieftain whose dominions were invaded. Other parties appeared in different parts of the island, and terrified the inhabitants by the havoc they committed. These were in like manner put to flight, but never failed to return in a short time; and in this manner was Ireland harassed for the space of 20 years, before the inhabitants thought of putting an end to their intestine contentions, and uniting against the common enemy. The northern pirates, either by force or treaty, gradually obtained some small settlements on the island; till at length Turges, or Turgesius, a warlike Norwegian, landed with a powerful armament in the year 815. He divided his fleet and army, in order to strike terror in different quarters. His followers plundered, burned, and massacred, without mercy, and persecuted the clergy in a dreadful manner on account of their religion. The Danes already settled in Ireland, flocked to the standard of Turgesius, who thus was enabled to seat himself in Armagh, from which he expelled the clergy, and seized their lands. The Irish, in the mean time, were infatuated by their private quarrels; till at last, after some ill-conducted and unsuccessful efforts, they sunk into a state of abject submission, and Turgesius was proclaimed monarch of the whole island in 845.

The new king proved such a tyrant, that he soon became intolerable. A conspiracy was formed against him; and he was seized by Melachliue prince of Meath, in a time of apparent peace. An universal insurrection ensued; the Danes were massacred or dispersed; their leader condemned to death for his cruelties, and drowned in a lake. The foreigners, however, were not exterminated, but the remains of them were allowed to continue on the island as subjects or tributaries to some particular chieftains. A new colony soon arrived, but under pretence of peaceable intentions, and a design of enriching the country by commerce. The Irish, through an infatuated policy, suffered them to become masters of Dublin, Limeric, Waterford, and other maritime places, which they enlarged and fortified with such works as had till then been unknown in Ireland. The Danes did not fail to make use of every opportunity of enlarging their territories, and new wars quickly ensued. The Irish were sometimes victorious, and sometimes not; but were never able to drive out their enemies, so that they continued to be a very distinguished and powerful *sibt*, or tribe, in Ireland. The wars with the Danes were no sooner at an end, than the natives, as usual, turned their arms against each other. The country was harassed by the competitions of the chiefs; laws and religion lost their influence, and the most horrid licentiousness and immorality prevailed. Thus the whole island seemed ready to become a prey to the first invader, when an attempt was made upon it by Magnus king of Norway. This attempt miscarried, through his own rashness; for, having landed without opposition, he advanced into the country without the least apprehension. The consequence of this was, that he was surrounded and cut in pieces with all his followers. His death, however, proved of little benefit to Ireland;

Ireland. the same disorders which had gradually reduced the kingdom to a state of extreme weakness, still continued to operate, and to facilitate the success of the English invasion, which happened in the reign of Henry II.

5  
Henry II. of England meditates an invasion of Ireland.

The first motives which induced this monarch to think of an expedition against Ireland are not well known. It was supposed that he had been provoked by some assistance which the Irish princes had given to the French; but, whatever might be in this, it is certain that the design was conceived soon after he ascended the throne; and his flatterers soon furnished him with sufficient reasons for considering the Irish as his subjects. It was affirmed that they had originally possessed themselves of their country by permission of Gurguntius a British king; and that, as descendants of the Britons, they were the natural and rightful subjects of the English monarch. It was also suggested, that the renowned King Arthur, Egfred the Northumbrian prince, and Edgar one of the Saxon kings of England, had all led their armies into Ireland, and there made valuable acquisitions, which their successor was in honour bound to recover and maintain. All these suggestions, however, or whatever else had occurred to himself, seemed yet insufficient to Henry; and therefore he took the most effectual method to ensure his reputation, namely, by an application to the pope. To him he represented, that the inhabitants of Ireland were sunk into the most wretched state of corruption, both with regard to morals and religion; that Henry, zealous for the honour and enlargement of God's kingdom, had conceived the pious design of erecting it in this unhappy country; was ready to devote himself and all his powers to this meritorious service; implored the benediction of the pontiff; and requested his permission and authority to enter Ireland, to reduce the disobedient and corrupt, to eradicate all sin and wickedness, to instruct the ignorant, and spread the blessed influence of the gospel in all its purity and perfection; promising at the same time to pay a yearly tribute to St Peter from the land thus to be reduced to his obedience, and to the holy see. Adrian, the reigning pope, rejoiced at this application which tended so much to the advancement of his own power.

6  
Is invested with the sovereignty by the pope.

A bull was therefore immediately formed, conformable to the most sanguine wishes of Henry, which was sent to England without delay, together with a ring, the token of his investiture as rightful sovereign of Ireland. But whatever inclination the king of England or the pope might at this time (A. D. 1156) have for the subjection of Ireland, the situation of the English affairs obliged him to defer it for some time.

7  
State of Ireland at that time.

The state of Ireland, as we have already observed, was at this time extremely favourable for an invasion. The monarch enjoyed little more than a titular dignity, being harassed by a faction, and opposed by powerful rivals. A number of chieftains who assumed the title and rights of royalty, paid a precarious tribute to their superior, and united, if they were disposed to unite, with him, rather as his allies than his subjects. In Ulster, the family of the northern *Hi Nial*, as it was called, exercised an hereditary jurisdiction over the counties now called *Tirone*, *Derry*, and *Donnegal*. They also claimed a right of supremacy over the lords of *Fermanagh*, *Aurtrim*, and *Argial*, which included

the counties of *Armagh*, *Monaghan*, *Lowth*, and some adjacent districts: while *Dunleve*, prince of *Uladh* (now *Down*), disputed the superiority of this family, and affected an independent state. In *Munster* reigned the descendants of *Brien*, a famous sovereign of former times, impatient to recover the honours of their family; but at last, being confined by powerful rivals to the territory of *North Munster*, they were obliged to leave the family of *Mac Arthy* sovereigns of *Desmond*, the southern division. In *Connaught*, the princes known by the name of *O'Connor* were acknowledged sovereigns of the eastern territory. *Tiernan O'Ruarc*, an active and restless military chief, had the supremacy in *Breffny*, containing the modern county of *Leitrim*, and some adjacent districts. *Meath*, or the southern *Hi Nial*, was subject to the family of *Clan-Colman*, *Murchard O'Malachlyn*, and his successors. *Leinster*, divided into several principalities, was subject to *Dermod*, a fierce, haughty, and oppressive tyrant. His father had governed with great cruelty. Seventeen of his vassal lords had been either put to death, or had their eyes put out, by his order in one year; and *Dermod* seemed to inherit too great a portion of the same temper. His stature and bodily strength made him admired by the inferior orders of his subjects, and these he was careful to protect and favour. His donations and endowments of religious houses recommended him to the clergy; but his tributary chieftains felt the weight of his pride and tyranny, and to them his government was extremely odious.

The chief competitors for the rank of monarch of Ireland, in the mean time, were, the heirs of the two houses of *O'Connor*, and the northern *Hi Nial*. *Torlogh O'Connor* was in possession; but he was not generally recognised, and was opposed by his rival *O'Lochlan*: notwithstanding which, he maintained his dignity with magnificence and vigour, till a decisive victory gained by him over *O'Brien* raised *O'Lochlan's* jealousy so much, that he obliged him in a convention of the states, to allow him the sovereignty of the northern division. In consequence of this partition, it was resolved to transfer the territory of *O'Ruarc* to a person more inclined to the interests of the two sovereigns. An expedition was accordingly undertaken; *O'Ruarc* was surprised, defeated, and driven from his dominions. *Dermod*, who had conceived an unlawful passion for *Dervorghal*, the wife of *O'Ruarc*, took the opportunity of her husband's distresses to carry her off in triumph. *O'Ruarc* conceived the most implacable resentment against *Dermod*; and therefore applying himself to *Torlogh*, promised an inviolable attachment to his interest; and prevailed on him not only to reinstate him in his possessions, but to revenge the insult offered by *Dermod*, and to restore his wife. By means of such a powerful ally, *O'Ruarc* found frequent opportunities of harassing his antagonist till the death of *Torlogh*, which happened in 1156, upon which *O'Lochlan* succeeded to the sovereignty. *Dermod* was the first to acknowledge the authority of this new sovereign, by whose means he hoped to be able to revenge himself on *O'Ruarc*. He soon found, however, that he had acted too precipitately. His patron, having treacherously seized and put out the eyes of *Dunleve* prince of *Down*, the neighbouring chieftains took

arms,

land. arms, in order to secure themselves from his barbarity. O'Lochlan was defeated and killed; upon which the monarchy devolved on Roderic the son of the late Torlogh O'Connor.

The new prince had acquired the reputation of valour, and was determined to establish this reputation by some remarkable exploit in the beginning of his reign. Having therefore engaged in his service the Ostmens, or descendants of the Danes, he marched against Dermod as the chief partizan of his fallen rival. The king of Leinster was seized with the utmost consternation; and in despair set fire to his own town of Feras, lest the enemy should have the satisfaction of spoiling it. Roderic still advanced, attended by O'Ruar, Dermod's implacable enemy, and soon over-ran the whole province. All the inferior lords at once acknowledged Roderic's authority. Dermod was deposed, as a man utterly unworthy of his station; another of his family was raised to the throne; and the unfortunate prince, finding it impossible to stay with safety in Ireland, embarked with 60 of his followers for England, and soon arrived at the port of Bristol, with a design to solicit assistance from king Henry.

In England, Dermod's character was unknown, and he was regarded as an injured prince driven from his throne by an iniquitous confederacy. The clergy received him as the benefactor of their order, and entertained him in the monastery of Augustines with great hospitality. Having learned that Henry was then in Aquitain, he immediately went thither, and in a very abject manner implored his assistance, promising to acknowledge him as his liege lord, and to hold his dominions, which he was thus confident of regaining, in vassalage to Henry and his heirs.

Though nothing could be more flattering to the ambition of the king of England than this servile address, yet the situation of his own affairs rendered it impossible for him at that time to reap from it any of the advantages with which it flattered him. He therefore dismissed the Irish prince with large presents, and a letter of credence addressed to all his subjects; notifying his grace and protection granted to the king of Leinster; and declaring, that whosoever within his dominions should be disposed to aid the unfortunate prince in the recovery of his kingdom, might be assured of his free licence and royal favour.

Dermod returned to England highly pleased with the reception he had met with; but notwithstanding the king's letter, none of the English seemed to be disposed to try their fortunes in Ireland. A month elapsed without any prospect of succours, so that Dermod began to despair. At last, however, he persuaded, with great promises, Richard Earl of Cheplow, or, as it was formerly called, *Strigul*, a nobleman of considerable influence in Wales, but of broken fortune, to assist him with a considerable force to be transported next spring into Ireland. Overjoyed at this first instance of success, he advanced into South Wales, where, by the influence of the bishop of St David's, he procured many other friends. Robert Fitz-Stephen, a brave and experienced officer, covenanted with him to engage in his service with all his followers, and Maurice Fitz-Gerald his maternal brother; while Dermod, on his part, promised to cede to the two principal leaders, Fitz-Stephen and Fitz-Gerald, the entire dominion of the town of Wexford, with a large adjoining territory,

as soon as by their assistance he should be reinstated in his rights.

The Irish prince having now accomplished his purpose, set sail for Ireland in the winter of 1169, and recovered a small part of his dominions even before the arrival of his new allies; but being attacked with a superior force by his old enemies Roderic and O'Ruar, he found himself obliged to feign submission till the English allies came to his assistance. The expected succours arrived in the month of May 1170, in a creek called the *Bann*, near the city of Wexford. Robert Fitz-Stephen commanded 30 knights, 60 men in armour, and 300 archers. With these came Harvey of Mountmorris, nephew to earl Richard. He had no military force along with him; but came solely with a view of discovering the nature of the country, and reporting it to his uncle. Maurice of Pendergast commanded 10 knights and 200 archers: and thus the English force which was to contend with the whole strength of Ireland, amounted to no more than 600 men.

Trifling as this assistance may seem, it nevertheless changed the face of affairs almost instantaneously. Numbers of Dermod's subjects, who had abandoned him in his distress, now flocked to his standard. Wexford was immediately attacked, and surrendered in a few days; Fitz-Stephen and Fitz-Gerald were jointly invested with the lordship of this city and its domain; and Harvey of Mountmorris was declared lord of two considerable districts on the coast. After three or four weeks spent in feasting and rejoicing, a new expedition was undertaken against the prince of Ossory (a district of Leinster), who had not only revolted from Dermod, but put out the eyes of one of his sons, and that with such cruelty, that the unhappy youth expired under the operation. The allied army was now increased to 3000 men, who were opposed by the prince of Ossory at the head of 5000, strongly entrenched among woods and morasses. By the superior conduct of the English troops, however, the Irish were decoyed from their advantageous situation, and thus were entirely defeated. The English were for keeping the field till they had totally reduced their enemies: but Dermod, accustomed only to ravage and plunder, contented himself with destroying the country; and a sudden reverse of fortune seemed ready to take place. The prince of Ossory, though defeated, still appeared in arms, and only waited for an opportunity of again opposing the enemy in the field. Maurice Pendergast also joined him with his whole troop, being provoked by Dermod, who had refused him leave to return to Wales. This defection, however, was in part supplied by the arrival of Fitz-Gerald with 10 knights, 30 horsemen, and 100 archers. Pendergast in a short time repented of his new alliance, and retired into Wales; so that the prince was obliged to make his submission to Dermod, which the latter with some reluctance accepted.

In the mean time, Roderick, having settled all his other affairs, advanced against the allies with a powerful army. Dermod was thrown into despair; but, encouraged by Fitz-Stephen, he encamped in a very strong situation, where he was soon besieged by Roderic. The latter, however, dreading the valour of the English, condescended to treat first with them, and then with Dermod, in order to detach them from the inte-

resto

Ireland.

11  
Peace con-  
cluded.

rests of each other: but as this proceeded evidently from fear, his offers were rejected by both parties; upon which he began to prepare for battle: but at the very time when the engagement should have commenced, either through the suggestions of his clergy, or of his own fears, Roderic entered into a new negotiation; which at last terminated in a peace. The terms were, that Dermod should acknowledge the supremacy of Roderic, and pay him such service as the monarchs of Ireland had usually received from inferior princes; and as a security for his faithful performance of this article, he delivered up his favourite son as an hostage to Roderic: but in order to establish this accommodation on the firmest basis, the latter obliged himself to give his daughter in marriage to the young prince as soon as Leinster should be reduced, and the peace of the island effectually restored. By a secret article, Dermod engaged to dismiss the British forces immediately after the settlement of his own province, and in the mean time not to bring over any further reinforcements from England.

12  
New ma-  
chinations  
of Dermod.

Thus ended the first British expedition into Ireland; the consequences of which were so little dreaded at that time by the natives, that their historians, though they dwell upon the principal wars and contests in other parts of the island, speak of the settlement of the Welshmen in Leinster with a careless indifference. But though the settlement of this colony seemed very little alarming to the generality, it could not escape the observation of discerning persons, that a man of Dermod's character would not long keep his treaties; and that on the first emergency he would have recourse to his former allies, who thus would establish themselves more and more, till at last they would reduce the country entirely under their subjection. These reflections, if any such were then made, were in a short time verified. Dermod was scarce settled in his own dominions, when he began to aspire at the sovereignty, and form schemes for dethroning Roderic. He applied to Fitz-Stephen and Fitz-Gerald; by whom he was again directed to apply to Richard earl of Chepstow, more commonly known by the name of *Strongbow*, on account of his feats of archery. Richard was very much inclined to accept of his invitation; but thought it incumbent upon him first to obtain the consent of king Henry. The king, however, did not incline that his subjects should make conquests for themselves in any other country, and therefore dismissed Richard with an equivocal answer; but the latter being willing to understand his sovereign's words in the most favourable sense, immediately set about the necessary preparations for his expedition. In May 1171, Raymond le Gros, Richard's domestic friend, and the near relation of Fitz-Stephen and Fitz-Gerald, landed at a place called *Dondonalf*, near Waterford, with 10 knights and 70 archers; and along with them came Harvey of Mountmorris, attended by a small train. The English immediately intrenched themselves, and erected a temporary fort for themselves: which proved a very necessary precaution; for the natives, justly attributing this new debarkation to the practices of Dermod, instantly formed a tumultuous army, and marched to expel the invaders. The English prepared to meet them; but when they perceived the great superiority of the enemy,

13  
A new bo-  
dy of Eng-  
lish arrive  
in Ireland.

they thought proper to retire to their fort. Here, however, they must have been totally cut off, had they not luckily collected a numerous herd of cattle from the neighbouring country for their subsistence. These they drove with fury among the Irish, who were thus put into the utmost confusion. The invaders seized the favourable moment; and, falling upon their disordered enemies, put them to flight, and drove great numbers of them into the sea, where they perished. Seventy prisoners were taken, all of them principal citizens of Waterford; who, though they offered large sums for their ransom, and even that the city should be delivered up to the English, were all barbarously put to death. This success and cruelty so intimidated the Irish, that they suffered these merciless invaders to maintain their station unmolested, and wait for the arrival of their associates.

Ireland  
14  
Their suc-  
cess and  
cruelty.

Richard in the mean time having assembled his vassals, led them through Wales, where he was joined by great numbers of other adventurers; but, when just on the point of embarking, was surprised by a positive command from the king, to desist from his intended enterprize, on pain of forfeiture of his lands and honours. He was now, however, too much interested in his scheme to retract; and therefore pretended to disbelieve the authenticity of the royal mandate. On the eve of the feast of St Bartholomew, he landed at Waterford with 200 knights and 1200 infantry, all chosen and well appointed soldiers. They were immediately joined by Raymond and his troop; and the very next day it was resolved to make an attempt upon Waterford. The city was taken by storm, and a dreadful massacre ensued; to which the cruel Dermod had the merit of putting an end. The marriage of Richard with Eva, the daughter of Dermod, was solemnized without delay, and a scene of joy and festivity succeeded the calamities of war.

15  
Earl Ric-  
ard arriv-  
ed with a

reinforce-  
ment.

A new expedition was now undertaken against Dublin; the inhabitants of which had either manifested some recent disaffection to Dermod, or had never been thoroughly forgiven for their old defection. Roderic advanced against the allied army with a formidable body, consisting, as is said, of 30,000 men: but, fearing to come to a general engagement, he contented himself with some slight skirmishes; after which, great part of his vassals forced him to dismiss them, and Dublin was left to its fate. The inhabitants were treated very severely; however, a considerable body of them, with Heculph their governor, had the good fortune to gain some vessels lying in the harbour, and made their escape to the northern islands. Earl Richard was now invested with the lordship of Dublin; and appointed Milo de Cogan, a brave English knight, his governor; while he himself, in conjunction with the forces of Dermod, over-ran the country of Meath, committing every where the most horrid cruelties. Roderic, in the mean time, unable to oppose them in the field, sent deputies to Dermod, commanding him to retire, and putting him in mind that his son was in his hands, and must answer with his life for the breach of those treaties which his father made so little scruple to violate. Natural affection, however, had very little place in the breast of Dermod. He expressed the utmost indifference about his son; and, with the

nd. the greatest arrogance, claimed the sovereignty of all Ireland: Roderic, provoked at this answer, cut off the young prince's head.

This piece of impotent cruelty served only to make the king odious to his own subjects, while Dermot and his English allies committed every where the greatest devastations, and threatened to subdue the whole island. This indeed they would probably have accomplished, had not the extraordinary success of Strongbow alarmed king Henry; who, fearing that he might render himself totally independent on the crown of Britain, issued his royal edict, strictly forbidding any English vessel from passing into Ireland with men, arms, or provisions; and commanding all his subjects at that time resident in Ireland, of whatever rank or degree, to return to their country before the ensuing feast of Esther, on pain of forfeiting their lands, and being declared traitors.

Our adventurers were plunged into the greatest distress by this peremptory edict. They now found themselves cut off from all supplies in the midst of their enraged enemies, and in danger of being forsaken by those who had attached themselves to them during their success. Raymond was dispatched with a most submissive message to the offended monarch; but before he received any favourable answer, every thing was thrown into confusion by the death of Becket \*, so that the king had neither leisure nor inclination to attend to the affairs of Ireland. About the same time the death of Dermot their great ally seemed almost to give a finishing stroke to the English affairs. An universal defection took place among their associates; and before they had time to concert any proper measures, Hesculph, who had formerly escaped from Dublin, appeared before that city with a formidable body of troops armed after the Danish manner. A furious attack ensued; which at last ended in the defeat and captivity of Hesculph, who was immediately put to death. This danger, however, was soon followed by one still greater. Roderic had formed a powerful confederacy with many of the Irish chieftains, and the kings of the northern isles, in order to extirpate the English totally from the island. The harbour of Dublin was blocked up by a fleet of 30 ships from the northern isles; while the confederated Irish took their stations in such a manner as to surround the city, and totally cut off all supplies of provisions. In two months time the English were reduced to great straits. On the first alarm, Richard had sent for assistance to Fitz-Stephen; who having weakened his own force, in order to serve the earl, the people of Wexford had risen and besieged Fitz-Stephen in his fort called *Carrig* near that city. A messenger now arrived, informing Strongbow that his friend was in the utmost danger, and must fall into the hands of his enemies if not assisted within three days; upon which a council of war was called, in order to deliberate on the measures necessary to be pursued in this desperate emergency. It was soon resolved to enter into a treaty with Roderic upon any terms that were not totally servile or oppressive. Laurence prelate of Dublin was appointed to carry the terms; which were, that Richard proposed to acknowledge Roderic as his sovereign, and to hold the province of Leinster as his vassal, provided he would raise the siege. Laurence soon returned with an

answer, probably of his own framing; namely, that Dublin, Waterford, Wexford, and all the forts possessed by the British, should be immediately given up; and that the earl and his associates should depart with all their forces by a certain day, leaving every part of the island free from their usurpations, and absolutely renouncing all their pretended claims. On these conditions they were to be spared; but the least reluctance or delay would determine the besiegers to storm the city.

These terms, though they contained nothing insolent or unreasonable, considering the present situation of the English, were yet intolerable to our indigent adventurers. After some time spent in silence, Milo de Cogan, suddenly starting up, declared his resolution to die bravely rather than submit to the mercy of barbarians. The spirit of desperate valour was instantly caught by the whole assembly; and it was resolved to risk their whole fortune on one desperate effort, by falling out against the enemy, and to make their attack upon that quarter where Roderic himself commanded. Accordingly, having persuaded a body of the townsmen to take part in this desperate enterprise, they marched out against their enemies, who expected nothing less than such a sudden attack. The besiegers were secure and careless, without discipline or order; in consequence of which, they were unable to sustain the furious assault of the English. A terrible slaughter ensued, and the Irish instantly fled in the greatest confusion; their monarch himself escaping only by mixing half naked with the crowd. The other chieftains who were not attacked caught the panic, and broke up their camps with precipitation; while the victors returned from the pursuit to plunder, and among other advantages gained as much provision as was sufficient to support them for a whole year.

Strongbow being thus relieved from his distress, committed the government of Dublin to Milo de Cogan, while he proceeded immediately to Wexford in order to relieve Fitz-Stephen; but in this he was disappointed; for that brave officer, having often repulsed his enemies, was at last treacherously deceived into submission and laid in irons. Strongbow, however, continued to advance; and was again attacked by the Irish, whom he once more defeated. On his arrival at Wexford, he found it burnt to the ground; the enemy having retired with Fitz-Stephen and the rest of the prisoners to Holy Island, a small island in the middle of the harbour, from whence they sent a deputation, threatening to put all the prisoners to death if the least attempt was made to molest them in their present situation. The earl then proceeded to Waterford, and from thence to Ferns; where he for some time exercised a regal authority, rewarding his friends and punishing his enemies. A more important object, however, soon engaged his attention. The king of England having settled his affairs as well as he could, now determined to conquer Ireland for himself. A summons was instantly dispatched to earl Richard, expressing the greatest resentment at his presumption and disobedience, and requiring his immediate presence in England. The earl found himself under a necessity of obeying; and having made the best dispositions the time would permit for the security of his Irish possessions, embarked for England, and met the king at Newham near Gloucester

cester. Henry at first affected great displeasure; but soon allowed himself to be pacified by a surrender of the city of Dublin, and a large territory adjacent, together with all the maritime towns and forts acquired by Strongbow: while on his part he consented that the earl should have all his other possessions granted in perpetuity, to be held of the king and his heirs. The other adventurers made their peace in a similar manner; while the Irish chieftains, instead of uniting in the defence of their country, only thought how to make the most of the approaching invasion, or at least how to avert the threatened evils from their own particular districts. They saw the power of their own sovereign on the point of total dissolution; and they saw it with indifference, if not with an envious and malignant satisfaction. Some were even ready to prevent their invader, and to submit before he appeared on the coast. The men of Wexford, who had possessed themselves of Fitz-Stephen, resolved to avert the consequences of their late perfidy and cruelty, by the forwardness of their zeal for the service of the king of England, and the readiness of their submissions. Their deputies cast themselves at Henry's feet; and, with the most passionate expressions of obedience, humbly intreated that he would accept them as his faithful vassals, ready to resign themselves, their lands, and possessions, to his absolute disposal. "They had already (they said) endeavoured to approve their zeal by seizing Robert Fitz-Stephen, a traitor to his sovereign, who had lately entered their territory by force of arms without any due warrant or fair pretence, had slaughtered their people, seized their lands, and attempted to establish himself independent of his liege lord. They kept him in chains, and were ready to deliver him to the disposal of his sovereign."—The king received them with expressions of the utmost grace and favour; commended their zeal in repressing the unwarrantable attempts of Fitz-Stephen: declared that he should soon inquire into his crimes, and the wrongs they had sustained, and inflict condign punishment for every offence committed by his undutiful subjects.—Thus were the Irishmen dismissed in the utmost joy and exultation; and the artifice of Henry, while it inspired these men with dispositions favourable to his interests, proved also the most effectual means of saving Fitz-Stephen from their cruelty.

Henry, having completed the preparations necessary for his expedition, embarked at Milford with several of his barons, 400 knights, and about 4000 soldiers, on board a fleet of 240 sail. He landed at Waterford on the feast of St Luke in October 1172; with a professed design not to conquer, but to take possession of a kingdom already his own, as being granted him by the pope. Most of the Irish indeed seemed to be of the same opinion, and therefore submitted without the least resistance. Strongbow set them an example, by making a formal surrender of Waterford, and doing homage to the king for the territory of Leinster. Fitz-Stephen was delivered up, with many accusations of tyranny and injustice. He was at first sent to prison; but soon purchased his liberty, by surrendering Wexford, and doing homage for the rest of his possessions to the king. The prince of Desmond was the first Irish chieftain who submitted. On the very day after the king's arrival, he attended his court, resigned

N<sup>o</sup> 168.

the city of Corke, did him homage, and stipulated to pay a tribute for the rest of his territory. An English governor and garrison were immediately appointed to take possession of his capital; and the king displayed his power and magnificence by marching to Lismore, where he chose a situation and gave the necessary orders for building a fort. The prince of Thomond next submitted and did homage. He was followed by the princes of Ossory, Decies, and all the inferior chiefs of Munster.

The king, after having provided for the security of all his newly acquired territories, and put garrisons in the cities of Limerick, Corke, Waterford, and Wexford, proceeded to take possession of Dublin, which had been surrendered by Strongbow. The neighbouring lords took the opportunity of submitting as he advanced. O'Carrol of Argial, a chieftain of great consequence, repaired to his camp, and engaged to become his tributary; and even O'Ruarc, whom Roderic had made lord of a considerable part of Meath, voluntarily submitted to the new sovereign.

Roderic, though surprised at the defection of so many of his allies, still determined to maintain his own dignity, and at least preserve his province of Connaught, seeing he could no longer call himself monarch of the whole island. With this design he entrenched himself on the banks of the Shannon; and now, when disencumbered from a crowd of faithless and discontented followers, he appears to have acted with a spirit and dignity becoming his station. Hugh de Lacy and William Fitz-Andelm were commissioned by the king to reduce him; but Roderic was too strong to be attacked with any probability of success by a detachment from the English army; and he at least affected to believe, that his situation was not yet so totally desperate as to reduce him to the necessity of resigning his dignity and authority, while his own territory remained inviolate, and the brave and powerful chiefs of Ulster still kept retired in their own districts without any thoughts of submission. Henry in the mean time attempted to attach the Irish lords to his interest by elegant and magnificent entertainments, such as to them appeared quite astonishing. Some historians pretend that he established the English laws in all those parts which had submitted to his jurisdiction; but this must appear extremely improbable, when we consider how tenacious a rude and barbarous people are of their ancient laws and customs. The Irish lords had been accustomed to do homage to a superior; and they had made no submission to Henry which they had not formerly done to Roderic, and probably thought their submission to the king of England more honourable than that to their Irish monarchs; and it cannot be supposed, that a wise and politic monarch, such as Henry undoubtedly was, should form at once such an extravagant scheme as altering the laws of a great number of communities, none of which he had subdued by force of arms. By his transactions both with the natives and adventurers, however, Henry had attained the absolute dominion of several maritime cities and their dependencies; so that he had both a considerable number of real subjects, and a large extent of territory, in the island. To these subjects indeed Henry granted the English laws; and gave the city of Dublin by charter to the inhabitants of Bristol, to be held of

And, by another charter, executed soon after, he confirmed to his burgessees of Dublin all manner of rights and immunities throughout his whole land of England, Normandy, Wales, and Ireland, wherever they and their effects shall be, to be fully and honourably enjoyed by them as his free and faithful subjects. And as it was not easy to induce his English subjects immediately to settle in these maritime towns, he permitted the Oskens to take possession of Waterford; and to them he granted a particular right of denization, whereby they were invested with the rights and privileges of free subjects, and for the future to be governed by the laws of his realm. For the better execution of these new laws the king also made a division of the districts now subject to him into shires or counties; which was afterwards improved and enlarged, as the extension of the English settlements and the circumstances of the country required. Sheriffs were appointed both for the counties and cities, with itinerant judges, and other ministers of justice, and officers of state, and every appendage of English government and law. To complete the whole system, a chief governor, or representative of the king, was appointed. His business was to exercise the royal authority, or such parts of it as might be committed to him in the king's absence; and, as the present state of Ireland, and the apprehensions of war or insurrections, made it necessary to guard against sudden accidents, it was provided, That in case of the death of any chief governor, the chancellor, treasurer, chief justice, and chief baron, keeper of the rolls, and king's serjeant at law should be empowered, with consent of the nobles of the land, to elect a successor, who was to exercise the full power and authority of this office, until the royal pleasure should be further known.

But while Henry was thus regulating the government of his new dominions, he received the unwelcome news, that two cardinals, Albert and Theodine, delegated by the pope, had arrived in Normandy the year before, to make inquisition into the death of Becket; that having waited the king's arrival until their patience was exhausted, they now summoned him to appear without delay, as he would avert the dreadful sentence of excommunication, and preserve his dominions from a general interdict. Such denunciations were of too great consequence to admit of his longer stay in Ireland; he therefore ordered his forces and the officers of his household to embark without delay, reserving three ships for the conveyance of himself and his immediate attendants. Having therefore but a short time to secure his Irish interests, he addressed himself to the original English adventurers, and by grants and promises laboured to detach them from Strongbow, and to bind them firmly to himself. To make amends for what he had taken from Fitz Stephen, he granted him a considerable district in the neighbourhood of Dublin, to be held by knight's service; at the same time entrusting the maritime towns to his own immediate dependants. Waterford was committed to Humphrey de Bohun, Robert Fitz-Bernard, and Hugh de Gundville, with a train of 20 knights. In Wexford were stationed William Fitz-Andelm,

Philip of Hastings, and Philip de Braosa, with a like number of attendants. Hugh de Lacy had a grant of all the territory of Meath, where there was no fortified place, and where of consequence no particular reservation was necessary, to be held of the king and his heirs, by the service of 50 knights, in as full a manner as it had been enjoyed by any of the Irish princes. He also constituted him lord governor of Dublin, with a guard of 20 knights. Robert Fitz-Stephen and Maurice Fitz-Gerald were appointed his coadjutors, with an equal train; and these, with others of the first adventurers, were thus obliged, under the pretence of an honourable employment, to reside at Dublin, subject to the immediate inspection of de Lacy, in whom Henry seems to have placed his chief confidence. Lands were assigned in the neighbourhood of each city for the maintenance of the knights and soldiers. Orders were given to build a castle in Dublin, and fortresses in other convenient places; and to John de Courcey, a baron distinguished by his enterprising genius and abilities for war, was granted the whole province of Ulster, provided he could reduce it by force of arms.

Henry was no sooner gone, than his barons began to contrive how they might best strengthen their own interests, and the Irish how they might best shake off the yoke to which they had so readily submitted. De Lacy parcelled out the lands of Meath to his friends and adherents, and began to erect forts to keep the old inhabitants in awe. This gave offence to O'Ruarc, who still enjoyed the eastern part of this territory as a tributary prince. He repaired to Dublin, in order to obtain redress from Lacy for some injuries real or pretended; but, as the parties could not come to an agreement, another conference was appointed on a hill called *Taragh*. Both parties came with a considerable train of armed followers; and the event was a scuffle, in which O'Ruarc and several of his followers were killed, and which served to render the English not a little odious to the natives.

The spirit of disaffection had soon after an opportunity of showing itself on the rebellion of king Henry's sons, of which an account is given under the article ENGLAND, n<sup>o</sup> 121. *See* *sup.* The king had been obliged to weaken his forces in Ireland, by withdrawing several of his garrisons. The soldiers who remained were also discontented with their general Hervey of Mountmorris, on account of his severity in discipline, and restraining them from plunder, to which they imagined themselves intitled on account of the deficiencies of their pay. Raymond le Gros, the second in command, was much more beloved by the soldiery; and to such a height had the jealousies between the commanders arisen, that all effectual opposition to the Irish chieftains was prevented; and the event might have been fatal to the English interest, had not Henry found out a remedy. He summoned earl Richard to attend him at Rouen in Normandy, and communicated his intentions of committing the affairs of Ireland to his sole direction. The earl expressed the utmost readiness to serve his master; but observed, that he had already experienced the envy and malignity of his secret enemies; that if he should appear in such a distinguished character as that of the king's deputy in Ireland, their insidious practices

Ireland. would be renewed, and his conduct misrepresented. He therefore requested that a colleague might be appointed in the commission; and recommended Raymond as a person of approved loyalty and abilities, as well as highly acceptable to the soldiery. The king replied, with an affected air of regard and confidence, that he had his free consent to employ Raymond in any service he should deem necessary, not as a colleague, but as an assistant; but that he relied entirely on the earl himself, and implicitly trusted every thing to his direction. To reward his services, he granted him the town of Wexford, together with a fort erected at Wicklow; and then dismissed him with the most gracious expressions of favour.

The earl landed at Dublin, where he was received with all the respect due to the royal commission. He signified the king's pleasure, that Robert Fitz-Bernard, with the garrison of Waterford, should instantly embark and repair to Normandy; that Robert Fitz-Stephen, and Maurice Pendergast, should attend the service of their sovereign in England; and, agreeably to the king's instructions, took on him the custody of the cities of Dublin, Waterford, and Wexford. Hugh de Lacy, and Milo de Cogan, were, with the other lords, commanded to repair to England for the service of the king; by which the earl's forces were considerably weakened, and he soon found himself under a necessity of appointing Raymond to the chief command. The new general proved successful in some enterprizes against the rebellious Irish; but having presumed upon his merits to demand in marriage Basilia the earl's sister, Richard refused his consent, and Raymond retired into Wales.

Thus the supreme command again devolved upon Hervey of Mountmorris; who, being sensible that his character had suffered much from a comparison with that of Raymond, determined to emulate his successes by some bold attempt against the rebels. A detachment of 400 of his men, however, had the misfortune to be surprized and cut off by the enemy; and this success served as a signal for a general revolt. Several of the Leinster chieftains, who had lately made their submissions, and bound themselves to the service of king Henry, now openly disclaimed all engagements. Even Donald Kevanagh, son to the late king Dermot, who had hitherto adhered to the English in their greatest difficulties, now declared against them, and claimed a right to the kingdom of Leinster; while Roderic, on his part, was active in uniting the princes of Ulster, the native lords of Meath, and other chiefs, against their common enemy. This produced the immediate recal of Raymond; and Richard no longer refused his consent to the marriage with his sister, which was solemnized immediately on Raymond's arrival. The very next morning, the bridegroom was obliged to take the field against Roderic, who had committed great devastations in Meath. By the vigorous conduct of the English commander, however, he was not only prevented from doing farther mischief, but at last convinced of the folly of resistance; and therefore determined to make a final submission. Yet, conscious of his dignity, he disdained to submit to a subject; and therefore, instead of treating with earl Richard, he sent deputies directly to the king. The deputies were, Catholicus archbishop of Tuam, the

abbot of St Brandan, and *Master Lawrence*, as he is styled, chancellor to the king of Connaught.

The terms of this submission, by which Henry became sole monarch of Ireland, were as follow: Roderic consented to do homage and pay tribute, as liege-man to the king of England; on which condition he was allowed to hold the kingdom of Connaught, as well as his other lands and sovereignties, in as ample a manner as he had enjoyed them before the arrival of Henry in Ireland. His vassals were to hold under him in peace, as long as they paid their tribute and continued faithful to the king of England; in which Roderic was to enforce their due obedience, and for this purpose to call to his assistance the English government, if necessary. The annual tribute to be paid was every 10th merchantable hide, as well from Connaught as from the rest of the island; excepting those parts under the immediate dominion of the king of England and his barons, viz. Dublin and Meath with their appurtenances, Wexford and all Leinster, and Waterford with its lands as far as Dungarvan inclusive; in all which districts Roderic was not to interfere, nor claim any power or authority. The Irish who had fled from these districts were to return, and either pay their tribute, or perform the services required by their tenures, at the option of their immediate lords; and, if refractory, Roderic, at the requisition of their lords, was to compel them to return. He was to take hostages from his vassals, such as he and his liege-lord should think proper; and on his part to deliver either these or others to the king, according to the royal pleasure. His vassals were to furnish hawks and hounds annually to the English monarch; and were not to detain any tenant of his immediate demesnes in Ireland, contrary to his royal pleasure and command. This treaty was solemnly ratified in a grand council of prelates and temporal barons, among whom we find the archbishop of Dublin one of the subscribing witnesses. As metropolitan of Leinster, he was now become an English subject, and was probably summoned on this occasion as one obliged to attend, and who had a right to assist in the king's great council. It is also observable, that Henry now treated with Roderic not merely as a provincial prince, but as monarch of Ireland. This is evidently implied and supposed in the articles; although his monarchical powers and privileges were little more than nominal, frequently disregarded and opposed by the Irish toparchs. Even by their submissions to Henry, many of them in effect disavowed and renounced the sovereignty of Roderic; but now his supremacy seems to be industriously acknowledged, that the present submission might appear virtually the submission of all the subordinate princes, and thus the king of England be invested with the sovereignty of the whole island. The marks of sovereignty, however, were no more than homage and tribute: in every other particular, the regal rights of Roderic were left inviolate. The English laws were only to be enforced in the English pale: and, even there, the Irish tenant might live in peace, as the subject of the Irish monarch; bound only to pay his quota of tribute, and not to take arms against the king of England.

But though the whole island of Ireland thus became subject to the king of England, it was far from being

being settled in tranquillity, or indeed from having the situation of its inhabitants mended almost in any degree. One great occasion of disturbance was, that the English laws were confined only to those parts which had been subdued by force of arms; while the chieftains that had only submitted to pay tribute, were allowed to retain the ancient Irish laws within the limits of their own jurisdictions. By these old Irish laws, many crimes accounted capital with us, such as robbery, murder, &c. might be compensated by a sum of money. Hence it happened, that very unequal punishments were inflicted for the same offence. If one Englishman killed another, he was punished with death; but if he killed an Irishman, he was punished only by a fine. If an Irishman, on the other hand, killed an Englishman, he was certainly punished with death: and as in times of violence and outrage, the crime of murder was very frequent, the circumstance just mentioned tended to produce an implacable hatred between the original inhabitants and the English. As the Irish laws were thus more favourable to the barbarity natural to the tempers of some individuals, many of the English were also tempted to lay aside the manners and customs of their countrymen altogether, and to associate themselves with the Irish, that, by becoming subject to their laws, they might thus have an opportunity of gratifying their brutal inclinations with less controul than formerly; and in process of time, these *degenerate English*, as they were called, proved more bitter enemies to their countrymen than even the Irish themselves.

Another cause of the distresses of Ireland was, the great power of the English barons, among whom Henry had divided the greatest part of his Irish dominions. The extent of their authority only inflamed them with a desire for more; and, instead of contributing their endeavours to increase the power of their sovereign, or to civilize the barbarous people over whom they were placed, they did every thing in their power to counteract and destroy each other. Henry himself, indeed, seems to have been infected with a very fatal jealousy in this respect; for, though the abilities and fidelity of Raymond had abundantly manifested themselves, the king never could allow himself to continue him in the government of the island: and the consequence of degrading him never failed to be a scene of uproar and confusion. To these two reasons we must likewise add another; namely, that in those parts of the kingdom where the Irish chieftains enjoyed the sovereignty, they were at full liberty to make war upon each other as formerly, without the least restraint. This likewise induced many of the English to degenerate, that they might have an opportunity of sharing the plunder got by these petty wars; so that, on the whole, the island was a perpetual scene of horror, almost unequalled in the history of any country.

After the death of earl Richard, Raymond was immediately elected to succeed him; but was superseded by the king, who appointed William Fitz-Andelm, a nobleman allied to Raymond, to succeed in his place. The new governor had neither inclination nor abilities to perform the task assigned to him. He was of a rapacious temper, sensual and corrupt in his manners; and therefore only studied to enrich himself. The

native Irish, provoked by some depredations of the English, commenced hostilities; but Fitz-Andelm, instead of repressing these with vigour in the beginning, treated the chieftains with affected courtesy and flattery. This they had sufficient discernment to see, and to despise; while the original adventurers had the burden of the whole defence of the *English pale*, as the English territories were called, thrown upon them, at the same time that the bad conduct of the governor was the cause of perpetual disorders. The consequence of this was, that the lord, avowed their hatred of Fitz-Andelm: the soldiers were mutinous, ill-appointed, and unpaid: and the Irish came in crowds to the governor with perpetual complaints against the old adventurers, which were always decided against the latter; and this decision increased their confidence, without lessening their disaffection.

In this unfavourable state of affairs, John de Courcey, a bold adventurer, who had as yet reaped none of the benefits he expected, resolved to undertake an expedition against the natives, in order to enrich himself with their spoils. The Irish at that time were giving no offence; and therefore pleaded the treaty lately concluded with King Henry: but treaties were of little avail, when put in competition with the necessities of an indigent and rapacious adventurer. The consequence was, that the flame of war was kindled through the whole island. The chieftains took advantage of the war with the English, to commence hostilities against each other. Desmond and Thomond, in the southern province, were distracted by the jealousies of contending chiefs, and the whole land was waisted by unnatural and bloody quarrels. Treachery and murder were revenged by practices of the same kind, in such a manner as to perpetuate a succession of outrages the most horrid, and the most disgraceful to humanity. The northern province was a scene of the like enormities; though the new English settlers, who were considered as a common enemy, ought to have united the natives among themselves. All were equally strangers to the virtues of humanity; nor was religion, in the form it then assumed, capable of restraining these violences in the least.

Ireland was thus in a short time reduced to such a state, that Henry perceived the necessity of recalling Fitz-Andelm, and appointing another governor. He was recalled accordingly; and Hugh de Lacey appointed to succeed him. He left his government without being regretted, and is said by the historians of those times to have done only one good action during the whole course of his administration. This action was nothing more important, than the removing of a relic, called the *staff of Jesus*, from the cathedral of Armagh to that of Dublin; probably that it might be in greater safety, as the war raged violently in Ulster. De Lacey, however, was a man of a quite different disposition, and every way qualified for the difficult government with which he was invested: but at the same time, the king, by investing his son John with the lordship of Ireland, gave occasion to greater disturbances than even those which had already happened. The nature of this lordship hath been much disputed; but the most probable opinion is, that the king's son was now to be invested with all the rights and powers which had formerly belonged to Roderic,

Ireland.

who was allowed the title of *king of Ireland*. It doth not appear, indeed, that Henry had any right to deprive Roderic of these powers, and still less had he to dispose of any of the territories of those chieftains who had agreed to become his tributaries; which nevertheless he certainly did, and which failed not to be productive of an immediate war with these chiefs.

The new governor entered on his office with all that spirit and vigour which was necessary; but being misrepresented to the king by some factious barons, he was in a short time recalled, and two others, totally unfit for the government, appointed in his room. This error was soon corrected, and Lacey was replaced in three months. The same jealousy which produced his first degradation, soon produced a second; and Philip de Braosa, or *Philip of Worcester*, as he is called, a man of a most avaritious disposition, was appointed to succeed him. This governor behaved in such a manner, that his superstitious subjects expected every moment that the vengeance of heaven would fall upon him, and deliver them from his tyranny. His power, however, was of short duration; for now prince John prepared to exercise the authority with which his father had invested him in Ireland. He was attended by a considerable military force: his train was formed of a company of gallant Normans in the pride of youth; but luxurious, insolent, and followed by a number of Englishmen, strangers to the country they were to visit, desperate in their fortunes, accustomed to a life of profligacy, and filled with great expectations of advantage from their present service. The whole assembly embarked in a fleet of 60 ships; and arrived at Waterford after a prosperous voyage, filling the whole country with the greatest surprise and expectation.

33  
His indif-  
cretion.

The young prince had not yet arrived at the years of discretion; nor indeed, from his subsequent conduct, doth it appear that his disposition was such as qualified him in the least for the high dignity to which he was raised. The hardy Welchmen who first migrated into Ireland, immediately waited upon him to do him homage; but they were disagreeable to the gay courtiers, and to the prince himself, who minded nothing but his pleasures. The Irish lords were at first terrified by the magnificent representation of the force of the English army; and being reconciled to submission by the dignity of the prince's station, hastened in crowds to Waterford to do him homage. They exhibited a spectacle to the Norman courtiers, which the latter did not fail to treat with contempt and ridicule. The Irish lords, with uncouth attire, thick bushy beards, and hair standing on end, advanced with very little ceremony; and, according to their own notions of respect, offered to kiss the young prince. His attendants stepped in, and prevented this horrid violation of decorum by thrusting away the Irishmen. The whole assembly burst into peals of laughter, pulled the beards, and committed several other indignities on the persons of their guests; which were immediately and severely resented. The chieftains left the court, boiling with indignation; and meeting others of their countrymen hastening to do homage to the prince, they informed them of the reception they themselves had met with. A league was instantly formed to extirpate the English, and the whole nation flew to arms; while John and his cour-

34  
A general  
revolt.

tiers, instead of opposing the enemy, employed themselves in harassing and oppressing those who were under their immediate jurisdiction. The country was therefore over-run by the barbarians, agriculture entirely neglected, and a dreadful famine threatened to follow the calamities of war.

This terrible devastation had continued for eight months before the king was fully acquainted with it. He then determined to recal his son; but was at a loss whom he should name for his successor. Lacey had been murdered by an Irish peasant, and the king was at last obliged to have recourse to John de Courcey, whose boisterous valour seemed now to be absolutely necessary to prevent the English from being totally exterminated. The new governor was obliged at first to act on the defensive; but as his enemies soon forgot their league, and began their usual hostilities against each other, he was at last enabled to maintain the authority of the English government, and to support their acquisitions in Ireland, though not to extend them.

In this situation were the affairs of Ireland when Henry II. died, and was succeeded by his son Richard I. The new king was determined on an expedition to the holy land, which left him no leisure to attend to the affairs of Ireland. John, by virtue of the powers granted him by his father, took upon him the management of Irish affairs; and immediately degraded de Courcey from his government, appointing in his place Hugh de Lacey the younger. De Courcey, provoked at this indignity, retired into Ulster, where he was immediately engaged in a furious war with the natives, and at last almost entirely detached himself from the English government. The greatest confusion ensued; Hugh de Lacey was recalled from his government, and William Petit, earl marshal of England, appointed in his place. Petit's administration proved more unfortunate than that of any of his predecessors. Confederacies every where took place against the English; the latter were every where defeated, their towns taken; and their power would certainly have been annihilated, had not the Irish, as usual, turned their arms against each other.

In this desperate situation matters continued during the whole reign of king Richard, and part of the reign of John, while the distresses of the country were increased by the dissensions and disaffection of the English lords, who aspired at independency, and made war upon each other like Irish chieftains. The prudent conduct of a governor named *Meiler Fitz-Henry*, however, at last put an end to these terrible commotions; and about the year 1208, the kingdom was more quiet than it had been for a long time before. In 1210, John came over to Ireland in person with an army, with a design, as he said, to reduce his refractory nobles to a sense of their duty. More than 20 Irish chiefs waited upon him immediately to do him homage; while three of the English barons, Hugh and Walter de Lacey and William de Braosa fled to France. The king, at the desire of his Irish subjects, granted them, for their information, a regular code and charter of laws, to be deposited in the exchequer of Dublin, under the king's seal. For the regular and effectual execution of these laws, besides the establishment of the king's courts of judicature in Dublin, there was

now

ad. now made a new and more ample division of the king's lands of Ireland into counties, where sheriffs, and many other officers, were appointed. These counties were, Dublin, Meath, Kildare, Argial, now called *Louth*, Katherlagh, Kilkenny, Wexford, Waterford, Cork, Kerry, Limeric, Tipperary; which marks the extent of the English dominions at this time as confined to a part of Leinster and Muntler, and to those parts of Meath and Argial which lie in the province of Ulster, as now defined. Before his departure, the king gave liberty to John de Grey, bishop of Norwich, whom he appointed governor, to coin money of the same weight with that of England; and which, by royal proclamation, was made current in England as well as Ireland.

This ecclesiastical governor is said to have managed affairs so happily, that during the violent contentions between John and his barons, Ireland enjoyed an unusual degree of tranquillity. We are not to imagine, however, that this unhappy country was at this or indeed any other period, till the end of Queen Elizabeth's reign, perfectly free from disorders, only they were confined to those distant most remote from the English government. In 1219, the commotions were renewed, thro' the immeasurable ambition and covetousness of the English barons, who despised all controul, and oppressed the inhabitants in a terrible manner. The disorders in England during the reign of Henry III. encouraged them to despise the royal authority; they were ever the secret enemies, and sometimes the avowed adversaries, of each other; and in many places where they had obtained settlements, the natives were first driven into insurrections by their cruelty, and then punished with double cruelty for their resistance. The English laws, which tended to punish the authors of these outrages, were scorned by an imperious aristocratic faction, who, in the phrenzy of rapine and ambition, trampled on the most salutary institutions. In 1228, a remonstrance was presented to the king against this dangerous neglect and suspension of the laws; which he answered by a mandate to the chief governor, directing that the whole body of nobility, knights, free tenants, and bailiffs of the several counties, should be convened; that the charter of English laws and customs received from king John, and to which they were bound by oath, should be read over in their presence; that they should be directed for the future strictly to observe and adhere to these; and that proclamation should be made in every county of Ireland, strictly enjoining obedience, on pain of forfeiture of lands and tenements. How little effect was produced by this order, we may learn from another, dated in 1246; where the barons are commanded, for the peace and tranquillity of the land, to *permit* it to be governed by the laws of England.

Nothing indeed can be conceived more terrible than the state of Ireland during the reign of Henry III. People of all ranks appear to have been sunk in the lowest degree of depravity. The powerful English lords not only subverted the peace and security of the people, by refusing to admit the salutary laws of their own country, but behaved with the utmost injustice and violence to the natives who did not enjoy the benefits of the English constitution. The clergy appear to have been equally abandoned with the rest: nor in-

deed could it be otherwise; for through the partialities of Henry himself, the neglected, the worthless, and the depressed among the English clergy, found refuge in the church of Ireland. What were the manners of these clergy, will appear from the following petition of a widow to king Edward I.

"Margaret le Blunle, of Cashel, petitions our lord the king's grace, that she may have her inheritance which she recovered at Clonmell before the king's judges, &c. against David Macmackerwayt bishop of Cashel.

"*Item*, the said Margaret petitions redress on account that her father was killed by the said bishop.

"*Item*, for the imprisonment of her grandfather and mother, whom he shut up and detained in prison until they perished by famine, because they attempted to seek redress for the death of their son, father of your petitioner, who had been killed by the said bishop.

"*Item*, for the death of her six brothers and sisters, who were starved to death by the said bishop, because he had their inheritance in his hands at the time he killed their father.

"And it is to be noted, that the said bishop had built an abbey in the city of Cashel, on the king's lands granted for this purpose, which he hath filled with robbers, who murder the English, and depopulate the country; and that when the council of our lord the king attempts to take cognizance of the offence, he fulminates the sentence of excommunication against them.

"It is to be noted also, that the said Margaret has five times crossed the Irish sea. Wherefore, the petitions for God's sake, that the king's grace will have compassion, and that she may be admitted to take possession of her inheritance.

"It is further to be noted, that the aforesaid bishop hath been guilty of the death of many other Englishmen besides that of her father; and that the aforesaid Margaret hath many times obtained writs of our lord the king, but to no effect, by reason of the influence and bribery of the said bishop.

"She further petitions, for God's sake, that she may have costs and damages, &c."

Matters continued in the same deplorable state during the reign of Edward I. with this additional grievance that the kingdom was infested by invasions of the Scots. The English monarch indeed possessed all that prudence and valour which were necessary to have reduced the island to a state of tranquillity; but his project of conquering Scotland left him but little leisure to attend to the distracted state of Ireland. Certain it is, however, that the grievous distress of that country gave him great uneasiness; so that he transmitted his mandate to the prelates of Ireland, requiring them to interpose their spiritual authority for composing the public disorders. About the same time, the Irish who lay contiguous to the English, and who dwelt among them, presented a petition to the king, offering to pay him 8000 merks, upon condition that they were admitted to the privileges of English subjects. To this petition he returned a favourable answer; but his good intentions were defeated by the licentious nobility, who knew that these laws would have circumscribed their rapacious views, and controuled their

Ireland.

40  
Little alteration under Edward I.

Ireland.

violence and oppression. Petitions of the same kind were several times repeated during this reign, but as often defeated; though some means were used for the peace of the kingdom, such as the frequent calling of parliaments, appointing sheriffs in some new counties, &c.

These means were not altogether without effect. They served to give some check to the disorders of the realm, though by no means to terminate or subdue them. The incursions of the natives were repressed, and the English lords began to live on better terms with each other; and, in 1311, under Edward II. the most powerful of them were reconciled by the marriage of Maurice and Thomas Fitz John, afterwards the heads of the illustrious houses of Desmond and Kildare, to two daughters of the earl of Ulster. But just at this happy period, when the nation seemed to have some prospect of tranquillity, more dreadful calamities than any hitherto related were about to take place. The Scots had just recovered their liberty under Robert Bruce, and were now in no danger of being again enslaved by a foreign power. Edward, the king's brother, as a recompence for his services, demanded a share of the royal authority. This was refused by Robert, and Edward was for the present satisfied by being declared heir apparent to the crown. But the king, wisely considering the necessity of finding out some employment for a youth of such an aspiring and ambitious disposition, pointed out to his brother the island of Ireland, the conquest of which would be easy, on account of the distracted state in which it almost always was, and which would make him an independent sovereign. This proposal was eagerly embraced by Edward, and every thing necessary for the expedition immediately got ready. On the 25th of May 1315, he landed on the north-eastern coast of Ireland with 6000 men, to assert his claim to the sovereignty of this kingdom. The Irish lords of Ulster, who had invited and encouraged him to this enterprise, were now prepared to receive their new monarch, flocked with eagerness to his standard, and prepared to wreak their vengeance on the common enemy. Their progress was marked by desolation and carnage. The English settlers were slaughtered, or driven from their possessions, their castles levelled with the ground, and their towns set on fire. The English lords were neither prepared to resist the invasion, nor sufficiently united among themselves. The consequence was, that the enemy for some time met with no interruption. An intolerable scarcity of provisions, however, prevented Bruce from pursuing his advantages; and though his brother landed in Ireland with a powerful army, the famine prevented him from being of any essential service. The forces which he left behind him, however, proved of considerable advantage; and by means of this reinforcement, he was enabled to take the city of Carrickfergus.

The terrible devastations committed by Bruce and his associates, now induced some English lords to enter into an association to defend their possessions, and repel these invaders. For this purpose, they raised a considerable body of forces; which coming to an engagement with Fethim prince of Connaught, one of Bruce's principal allies, entirely defeated and killed him with 2000 of his men. This defeat, however, had very

little effect on the operations of Bruce himself. He ravaged the country to the walls of Dublin, traversed the district of Ossory, and penetrated into Munster, destroying every thing with fire and sword. The English continued to augment their army, till at last it amounted to 30,000 men; and then Bruce, no longer able to oppose such a force, found it necessary to retire into the province of Ulster. His retreat was effected with great difficulty; and during the time of his inactivity, the distresses of his army increased to such a degree, that they are said to have fed upon the bodies of their dead companions. At last an end was put to the sufferings and the life of this adventurer in the battle of Dundalk, in 1318, where he was defeated and killed by the English under Sir Robert Birmingham. A brave English knight, named *Mauvas*, had rushed forward to encounter Bruce himself, and both antagonists had killed each other; the body of *Mauvas* being found, after the battle, stretched upon that of Bruce. The king of Scotland had been advancing with powerful succours to his brother; but Edward, confident of victory, refused to wait his arrival; and Robert, on hearing of his brother's death, instantly retired.

The defeat of the Scottish invaders did not put an end to the disturbances of this unhappy country. The contentions of the English with one another, of the Irish with the English, and among themselves, still kept the island in a state of the utmost barbarity and confusion. An attempt was made indeed, in the reign of Edward II. to establish an university in Dublin; but for want of proper encouragement the institution for some time languished, and then expired amidst the confusion and anarchy of the country. The reign of Edward III. proved not much more favourable than preceding times had been. He was too much taken up with the idea of conquering France, to pay much regard to the interests of Ireland. The unhappy people, indeed, sensible of their own miseries, petitioned the king to admit all his subjects in Ireland to a participation of the English laws; but the petition being delivered as usual to the chief governor, and laid before the parliament, it was either clandestinely defeated or openly rejected. A new scene of tumult and bloodshed immediately ensued; which at last produced an order from the king, prohibiting all Irishmen, or Englishmen married and having estates in Ireland, from bearing any public office whatever.— This, instead of having a tendency to promote peace, made the disorders much greater than before; and at last produced a remonstrance from the states met at Kilkenny, in which they grievously complain not only of the disorders of the kingdom, but also of the conduct of the king himself in the edict above mentioned: and to this remonstrance the king thought proper to give a gracious and condescending answer, in order to procure from Ireland the succours he wanted in his expedition against France.

It is not to be supposed, that mere promises, unassisted by any vigorous exertion, could make the least alteration in the state of a kingdom involved in so much misery. The disorders, however, at last became insupportable to the inhabitants themselves; and a parliament was summoned in 1367, the result of which was the famous statute of Kilkenny. The preamble

At  
Invasion of  
the Scots  
in the  
reign of  
Edward II.

4  
They  
totally  
feated.

43  
Miserie  
the Irish  
under  
ward II

to this act recites, that the English had become mere Irish in their language, names, apparel, and manner of living; had rejected the English laws, and submitted to those of the Irish, with whom they had united by marriage alliance, to the ruin of the common-wealth.—It was therefore enacted, that marriage, nurture of infants, &c. with the Irish, should be considered and punished as high treason.—Again, if any man of English race should use an Irish name, the Irish language, or the Irish apparel, or any mode or custom of the Irish, the act provides, that he shall forfeit lands and tenements, until he hath given security in the court of chancery to conform in every particular to the English manners; or if he have no lands, that he shall be imprisoned till the like security be given. The Brehon law was pronounced to be a pernicious custom and innovation lately introduced among the English subjects; and it was therefore ordained, that in all their controversies they should be governed by the common law of England; and that whoever should submit to the Irish jurisdiction, should be adjudged guilty of high treason. As the English had been accustomed to make war or peace with the bordering Irish at pleasure, they were now expressly prohibited from levying war without special warrant from the state.—It was also made highly penal for the English to permit their Irish neighbours to graze their lands, to present them to ecclesiastical benefices, or to receive them into monasteries or religious houses; to entertain their bards, who perverted their imaginations by romantic tales; or their news-tellers, who seduced them by false reports.—It was made felony to impose or cede any forces upon the English subject against his will. And as the royal liberties and franchises were become sanctuaries for malefactors, express power was given to the king's sheriffs to enter into all franchises, and there to apprehend felons and traitors.—Lastly, because the great lords, when they levied forces for the public service, acted with partiality, and laid unequal burdens upon the subjects, it was ordained that four wardens of the peace in every county should adjudge what men and armour every lord or tenant should provide.—The statute was promulgated with particular solemnity; and the spiritual lords, the better to enforce obedience, denounced an excommunication on those who should presume to violate it in any instance.

This statute, it is evident, could not tend to promote the peace of the kingdom. This could only have been done by removing the animosity between the native Irish and English; but so far was the statute of Kilkenny from having any tendency of this kind, that it manifestly tended to increase the hatred between them. During the whole of this reign, therefore, the state of the Irish government continued to be greatly disordered and embroiled. The English interest gradually declined; and the connections of the king's subjects with the original inhabitants, occasioned by their vicinity and necessary intercourse, in despite of all legal injunctions, obliged the king to relax the severity of the statutes of Kilkenny, in cases where they proved impracticable, or oppressive in the execution. The perpetual hostility, however, in which the different parties lived, proved an effectual bar to the introduction of those arts which contribute to the comfort and

refinement of mankind. Even foreign merchants could not venture into such a dangerous country without particular letters of protection from the throne. The perpetual succession of new adventurers from England, led by interest or necessity, served only to inflame disaffection, instead of introducing any essential improvement. Lawyers sent from England were notoriously insufficient, if not corrupt; and, as such, had frequently been the objects of complaint. The clergy were a mean grovelling race, totally influenced by the crown. Even prelates were commonly made the inferior agents of government in collecting forces, and raising war against the Irish enemy; but were not to be enticed into this service, except by remittances from the exchequer. Attendance in parliament they dreaded as the greatest hardship; and either recurred to mean excuses to avert the penalty of absence, or sued to the king to be exempted by patent from contributing or assenting to those laws by which they were to be governed.

In this deplorable situation the kingdom continued till the time of Henry VII. who laid the foundation of the future civilization of the Irish, as he also did of the English nation. This he effected by enacting some salutary laws, and appointing faithful and active governors to see them put in execution. Of these governors Sir Edward Poyning's contributed more than any other to the tranquillity of the state. During his administration was enacted the law known by the name of *Poyning's Law*, and which hath since been the subject of much political debate. The purport of it was, That no parliament should be held in that island without first giving notice to the king of England, and acquainting him with the acts to be passed in that parliament; neither should any act passed, or any parliament held, without the approbation of the king and council, be deemed valid. Thus was the power of the turbulent barons greatly broken; and the governor, not having it in his power to assemble parliaments when he pleased, became a person of much less consequence. The whole Irish legislation also became dependent on that of England, and hath ever since continued to be so.

From this time we may date the revival of the English power in Ireland; which from the Scottish war in the time of Edward II. had gradually declined into a miserable and precarious state of weakness. The authority of the crown, which had at last been defied, insulted, and rejected, even in the English territory, was restored and confirmed, and the rebellions vigorously opposed and suppressed. The feignory of the British crown over the whole body of the Irish, which in former reigns seemed to have been totally forgotten, was now formally claimed and asserted, and some of the most ferocious chieftains by their marriage-connections became the avowed friends of the English power. An ignominious tribute, called the *Black Rent*, was indeed still paid to some chieftains; but their hostilities were opposed and chastised, and even in their own districts they were made to feel the superiority of English government.

During the reign of Henry VIII. the Irish affairs were neglected; and the disorders, which had only been checked, and never thoroughly eradicated, returned as usual. They were further promoted by the

<sup>45</sup> Power of the English revives under Henry VII.

<sup>46</sup> Poyning's Law.

Ireland.  
 47  
 All the disorders ended in the reign of queen Elizabeth.

innovations in religion which the king introduced, and which were exceedingly disagreeable both to English and Irish. The Reformation, however, continued to make some progress, though slowly, during the reign of Edward VI. and even in the reign of queen Mary; for as the persecution did not reach thither, many Protestants fled to Ireland in order to avoid the queen's cruelty. The machinations of the Spaniards against queen Elizabeth excited the Irish to fresh insurrections. The king of Spain, indeed, not only encouraged the natives in those insurrections, but actually sent over troops to assist them in driving out the English altogether. This they had well nigh effected; but the Spaniards, upon seeing an army of Irish defeated by a handful of their enemies, were so much provoked that they surrendered all the places they had made themselves masters of, and even offered to assist the English in reducing the rebels; though it was not thought proper to accept of their assistance. The consequence of this was, that the Irish, abandoned by these allies, were unable to carry on the war; and the grand rebel O'Neal of Tirowen, or Tirone, after much treachery, evasion, and many pretended submissions, was at last obliged to submit in good earnest. He fell upon his knees before the deputy, and petitioned for mercy with an air and aspect of distress. He subscribed his submission in the most ample manner and form. He implored the queen's gracious commiseration; and humbly sued to be restored to his dignity, and the state of a subject, which he had justly forfeited. He utterly renounced the name of *O'Neal*, which he had assumed on account of the great veneration in which it was held among the Irish. He abjured all foreign power, and all dependency except on the crown of England; resigned all claim to any lands excepting such as should be conferred upon him by letters patent; promising at the same time to assist the state in abolishing all barbarous customs, and establishing law and civility among his people. The lord deputy, on the part of the queen, promised a full pardon to him and all his followers; to himself the restoration of his blood and honours, with a new patent for his lands, except some portions reserved for certain chieftains received into favour, and some for the use of English garrisons.

No insurgent now remained in this kingdom who had not obtained or sued for mercy. Many, indeed, were driven by necessity to the continent, and earned a subsistence by serving in the armies of Spain; and thus a race of Irish exiles was trained to arms, filled with a malignant resentment against the English. Thus the honour of reducing all the enemies of the crown of England in this island, after a continued contest for 440 years, was reserved for the arms of Elizabeth. The ghastliness of famine and desolation was now somewhat enlivened by the restoration of tranquillity. Indeed, from the most authentic accounts the prices of provisions were so high, that considering the value of money at that time, it is surprising how the inhabitants could subsist. From an account of the rates of provisions taken by the mayor of Dublin in 1602, it appears, That wheat had risen from 36 s. to 91. the quarter; barley-malt from 10 s. to 43 s. the barrel; oat-malt from 5 s. to 22 s. the barrel; pease from 5 s. to 40 s. the peck; oats from 3 s. 4d. to 20 s. the

No 169.

barrel; beef from 26 s. 8d. to 81. the carcase; mutton from 3 s. to 26 s. the carcase; veal from 10 s. to 29 s. the carcase; a lamb from 12 d. to 6 s.; a pork from 8 s. to 20 s.

Under James I. Ireland began to assume a quite different appearance. That monarch valued himself upon promoting the arts of peace, and made it his study to civilize his barbarous Irish subjects. By repeated conspiracies and rebellions, a vast tract of land had escheated to the crown in six northern counties, Tyrconnel, now called *Donnegal*, Tirone, Derry, Fermanagh, Cavan, and Armagh, amounting to about 500,000 acres; a tract of country covered with woods, where rebels and banditti found a secure refuge, and which was destined to lie waste without the timely interposition of government. James resolved to dispose of these lands in such a manner as might introduce all the happy consequences of peace and cultivation. He caused surveys to be taken of the several counties where the new settlements were to be established; described particularly the state of each; pointed out the situations proper for the erections of towns and castles; delineated the characters of the Irish chieftains, the manner in which they should be treated, the temper and circumstances of the old inhabitants, the rights of the new purchasers, and the claims of both; together with the impediments to former plantations, and the methods of removing them.

At his instance it was resolved, that the persons to whom lands were assigned should be either new undertakers from Great Britain, especially from Scotland, or *servitors*, as they were called; that is, men who had for some time served in Ireland, either in civil or military offices; or old Irish chieftains or captains. Among the last were included even those Irish who had engaged in the rebellion of Tirone, and still harboured their secret discontents. To gain them, if possible, by favour and lenity, they were treated with particular indulgence. Their under tenants and servants were allowed to be of their own religion; and, while all the other planters were obliged to take the oath of allegiance, they were tacitly excepted. The *servitors* were allowed to take their tenants either from Ireland or Britain, provided no Popish recusants were admitted. The British undertakers were confined to their own countrymen.

In the plantations which had been formerly attempted, the Irish and English had been mixed together, from a fond imagination that the one would have learned civility and industry from the other. But experience had now discovered, that this intercourse served only to make the Irish envy the superior comforts of their English neighbours, and to take the advantage of a free access to their houses to steal their goods and plot against their lives. It was therefore deemed necessary to plant them in separate quarters; and in the choice of these situations, the errors of former times were carefully corrected. The original English adventurers, on their first settlement in Ireland, were captivated by the fair appearance of the plain and open districts. Here they erected their castles and habitations; and forced the old natives into the woods and mountains, their natural fortresses. There they kept themselves unknown, living by the milk of their kine, without husbandry or tillage; there they increased to

48  
 Exorbitant prices of provisions at that time.

Ireland. incredible numbers by promiscuous generation; and there they held their assemblies, and formed their conspiracies, without discovery. But now the northern Irish were placed in the most open and accessible parts of the country, where they might lie under the close inspection of their neighbours, and be gradually habituated to agriculture and the mechanic arts. To the British adventurers were assigned places of the greatest strength and command; to the servitors, stations of the greatest danger, and greatest advantage to the crown: but as this appeared a peculiar hardship, they were allowed guards and entertainment, until the country should be quietly and completely planted.

The experience of ages had shown the inconvenience of enormous grants to particular lords, attended with such privileges as obstructed the administration of civil government: and, even in the late reign, favourite undertakers had been gratified with such portions of land as they were by no means able to plant. But, by the present scheme, the lands to be planted were divided in three different proportions; the greatest to consist of 2000 English acres, the least of 1000, and the middle of 1500. One half of the escheated lands in each county was assigned to the smallest, the other moiety divided between the other proportions: and the general distributions being thus ascertained, to prevent all disputes between the undertakers, their settlements in the respective districts were to be determined by lot. Estates were assigned to all, to be held of them and their heirs. The undertakers of 2000 acres were to hold of the king *in capite*; those of 1500, by knights service; those of 1000, in common socage. The first were to build a castle, and inclose a strong court yard, or *lawn* as it was called, within four years; the second, to finish an house and bawn within two years; and the third, to inclose a bawn; for even this rude species of fortification was accounted no inconsiderable defence against an Irish enemy. The first were to plant upon their lands, within three years, 48 able men of English or Scottish birth, to be reduced to 20 families; to keep a demesne of 600 acres in their own hands; to have four fee farmers on 120 acres each; six lease holders, each on 100 acres; and on the rest, eight families of husbandmen, artificers, and cottagers. The others were under the like obligations proportionably. All were, for five years after the date of their patents, to reside upon their lands either in person, or by such agents as should be approved by the state, and to keep a sufficient quantity of arms for their defence. The British and servitors were not to alienate their lands to mere Irish, or to demise any portions of them to such persons as should refuse to take the oaths to government; they were to let them at determined rents, and for no shorter term than 21 years or three lives. The houses of their tenants were to be built after the English fashion, and united together in towns or villages. They had power to erect manours, to hold courts-baron, and to create tenures. The old natives, whose tenures were granted in fee-simple, to be held in socage, were allowed the like privileges. They were enjoined to set their lands at certain rents, and for the like terms as the other undertakers; to take no Irish exactions from their inferior tenants, and to oblige them to forsake their old Scythian custom of wandering with their cattle from place to place for pa-

Ireland. sture, or *creaghting*, as they called it; to dwell in towns, and conform to the English manner of tillage and husbandry. An annual rent from all the lands was reserved to the crown for every 60 English acres, six shillings and eight pence from the undertakers, ten shillings from servitors, and 13 shillings and four pence from Irish natives. But for two years they were exempt from such payments, except the natives, who were not subject to the charge of transportation. What gave particular credit to this undertaking, was the capital part which the city of London was persuaded to take in it. The corporation accepted of large grants in the county of Derry; they engaged to expend L. 20,000 on the plantation, to build the cities of Derry and Colerain, and stipulated for such privileges as might make their settlements convenient and respectable. As a competent force was necessary to protect this infant plantation, the king, to support the charge, instituted the order of baronets, an hereditary dignity, to be conferred on a number not exceeding 200; each of whom, on passing his patent, was to pay into the exchequer such a sum as would maintain 30 men in Ulster, for three years, at 8*d.* daily pay.

But scarcely had the lands been allotted to the different patentees, when considerable portions were reclaimed by the clergy as their rightful property. And so far had the estates of the northern bishoprics been embarrassed, both by the usurpations of the Irish lords, and the claims of patentees, that they scarcely afforded a competent, much less an honourable, provision for men of worth and learning, while the state of the parochial clergy was still more deplorable. Most of the northern churches had been either destroyed in the late wars or had fallen to ruin: the benefices were small, and either shamefully kept by the bishops in the way of commendam or sequestration; or filled with ministers as scandalous as their income. The wretched flock was totally abandoned; and for many years divine service had not been used in any parish-church of Ulster, except in cities and great towns. To remedy these abuses, and to make some proper provision for the instruction of a people immersed in lamentable ignorance, the king ordained, that all ecclesiastical lands should be restored to their respective fees and churches, and that all lands should be deemed ecclesiastical from which bishops had in former times received rents or pensions: that compositions should be made with the patentees for the site of cathedral churches, the residences of bishops and dignitaries, and other church-lands which were not intended to be conveyed to them; who were to receive equivalents if they compounded freely; or else to be deprived of their patents as the king was deceived in his grant, and the possessions restored to the church. To provide for the inferior clergy, the bishops were obliged to resign all their impropriations, and relinquish the tythes paid them out of parishes, to the respective incumbents; for which ample recompence was made out of the king's lands. Every proportion allotted to undertakers was made a parish, with a parochial church to each. The incumbents, besides their tythes and duties, had glebe-lands assigned to them of 60, 90, or 120 acres, according to the extent of their parishes. To provide for a succession of worthy pastors, free-schools were endowed in

Ireland.

the principal towns, and considerable grants of lands conferred in the university of Dublin, which had been re-established by queen Elizabeth, together with the advowson of six parochial churches, three of the largest, and three of the middle proportion in each county.

Such was the general scheme of this famous northern plantation, so honourable to the king, and of such consequence to the realm of Ireland. Its happy effects were immediately perceived, although the execution by no means corresponded with the original idea. Buildings were slowly erected; British tenants were difficult to be procured in sufficient numbers; the old natives were at hand, offered higher rents, and were received into those districts from which it was intended to exclude them. In this particular, the Londoners were accused of being notoriously delinquent. They acted entirely by agents; their agents were interested and indolent, and therefore readily countenanced this dangerous intrusion of the natives; an error of which sufficient cause was afterwards found to repent. For the present, however, a number of loyal and industrious inhabitants was poured into the northern counties, considerable improvements made by the planters, and many towns erected. To encourage their industry, and advance his own project, the king was pleased to incorporate several of these towns, so that they had a right of representation in the Irish parliament.

50  
State of Ire-  
land since  
that time.

The only disturbance that now ensued was from the Popish party, who never could bear to see the Protestant religion established in preference to their own, while they had power to resist. After numberless ineffectual machinations and complaints, their fury broke out in a terrible massacre of the new English settlers in the year 1641\*. The affairs of Britain were at that time in such confusion, that the rebellion could not be quelled in less than ten years; during which time the country was reduced to a most deplorable situation. It recovered again under Cromwell, Charles II. and the short reign of James II. On the accession of William III. matters were once more thrown into confusion by an attempt made in favour of the exiled monarch, who came over thither in person, and whose bad success is related under the article BRITAIN, n<sup>o</sup> 309—325. Since that time, Ireland hath recovered from the miserable situation to which it was so long reduced. As yet, however, it is far from being in such a flourishing state as either South or North Britain. One great obstacle to the improvement of the kingdom is the extreme poverty and oppression of the common people. The produce of the kingdom, either in corn or cattle, is not above two thirds at most of what by good cultivation it might yield. The high roads throughout the southern and western parts are lined with beggars, who live in huts or cabbins without chimnies, or any covering capable of defending the wretched inhabitants from the cold, wind, and rain. "It is a scandal (says a judicious traveller, who lately visited Ireland) to the proprietors of this fertile country, that there is not the greatest plenty of good corn and hay in it; but some of the best land in the king's dominions is suffered to be torn in pieces, and cultivated in the vilest manner, by a set of abject miserable occupiers; who are absolutely no better than

\* See Bri-  
tain, n<sup>o</sup> 103  
—106.

slaves to the despicable, lazy, and oppressive subordinate landlords."

Ireland.

Another cause consisted in the various restrictions which it had been thought proper to lay upon the Irish trade, and the constant and great preference given by government to the English manufacturers, at last produced the most grievous discontents and distresses. On the part of England it was supposed, that as Ireland had been subdued by force of arms, the inhabitants ought in every respect to be subject to the victorious state; and that the interest of the English ought on all occasions to be consulted, without regarding the inconveniences which might ensue to the Irish. A very different idea, however, was entertained by the Irish themselves, or at least by the patriotic party among them. They rejected all notions of dependence upon the British ministry and parliament; and though they did not scruple to acknowledge the king's right of conquest, they most positively denied that the British parliament had any authority whatever over them; and therefore looked upon the restrictions laid upon their trade as the most grievous and intolerable oppression.

51  
Origin of  
the Irish  
discontents.  
52  
State of  
the argu-  
ment for  
and against  
the Irish.

In the year 1719, according to Mr Crawford, the oppression and grievances of Ireland became altogether insupportable. A cause relative to an estate, betwixt Hester Sherlock and Maurice Annesley, was tried before the court of exchequer in Ireland. Here the latter obtained a decree in his favour; but, on an appeal, the sentence was reversed by the lords. Annesley appealed from them to the English peers; who having reversed the judgement of those of Ireland, he was put in possession of the subject in dispute. Sherlock appealed again to the Irish lords, and the matter became very serious. It was proposed to the consideration of the judges, whether by the laws of the land an appeal lies from a decree of the court of exchequer in Ireland to the king in parliament in Britain. This question being determined in the negative, Sherlock was again put in possession of the estate. A petition was some time after presented to the house by Alexander Burrows sheriff of Kildare, setting forth, "That his predecessor in office had put Sherlock in possession of the premises; that, upon his entering into office, an injunction, agreeable to the order of the English peers, issued from the exchequer, requiring him to restore Maurice Annesley to the possession of the above mentioned lands; and that, not daring to act in contradiction to the order of the house, he was fined. In consequence of this, being afraid lest he should be taken into custody, he durst not come in to pass his accounts; and for this he was fined L. 1200." His conduct was applauded by the Irish lords, who commanded the fines imposed upon him to be taken off; and in a short time after drew up a memorial to be presented to his majesty. In this they set forth, that having submitted to Henry II. as land-  
54

twixt the  
peers of  
Ireland  
and Eng-  
land.

their liege lord, they had from him obtained the benefit of English law, with many other privileges, particularly that of having a distinct parliament. In consequence of this concession, the English had been encouraged to come over and settle in Ireland, where they were to enjoy the same privileges as in their own country. They farther insisted, that though the imperial crown of Ireland was annexed to that of Britain, yet being a distinct dominion, and no part of the kingdom

kingdom of England, none could determine with regard to its affairs, but such as were authorized by its known laws and customs, or the express consent of the king. It was an invasion of his majesty's prerogative for any court of judicature to take upon them to declare, that he could not by his authority in parliament determine all controversies betwixt his subjects of this kingdom; or that, when they appealed to his majesty in parliament, they did not bring their cause before a competent judicature: and they represented, that the practice of appeals from the Irish parliament to the British peers was an usurped jurisdiction assumed by the latter; the bad consequences of which they pointed out very fully.

This representation being laid before his majesty in parliament, it was resolved, that the barons of exchequer in Ireland had acted with courage and fidelity, according to law, &c. and an address was presented to his majesty, praying him to confer on them some mark of his royal favour as a recompense for the injuries they had sustained from the Irish legislature. This was followed by a bill for the better securing the dependency of Ireland upon the crown of Great Britain. By this it was determined, "That the house of lords of Ireland have not, nor of right ought to have, any jurisdiction to judge of, affirm, or reverse, any judgment, sentence, or decree, given or made in any court within the kingdom; and that all proceedings before the said house of lords, upon any such judgment or decree, are utterly null and void to all intent and purposes whatever." It was also determined in this bill, that "the king's majesty, by and with the advice and consent of the lords spiritual and temporal, and commons of Great Britain in parliament assembled, had, hath, and of right ought to have, full power and authority to make laws and statutes of sufficient force and validity to bind the people of Ireland."

This bill was looked upon by the Irish to be equivalent to a total annihilation of their liberties; and they were still farther exasperated in the year 1724, by the patent granted to one Wood an Englishman to coin halfpence and farthings for the use of Ireland. In this affair Wood is said to have acted very dishonourably; inasmuch that a shilling of the halfpence he made were scarcely worth a penny. Great quantities of this base coin were sent over; and it was used not only in change, but accounts were likely to be paid in it, so that dangerous consequences seemed ready to ensue. The Irish parliament, in an address to the king, represented that they were called upon by their country to lay before his majesty the ill consequences of Wood's patent, and that it was likely to be attended with a diminution of the revenue and the ruin of trade. The same was set forth in an application made to his majesty by the privy council. In short, the whole nation seemed to unite their efforts in order to remedy an evil of such dangerous tendency, the effects of which already began to be felt.

Among the controversial pieces which appeared on this occasion, those of Dr Swift were particularly distinguished. His Drapier's letters are to this day held in grateful remembrance by his countrymen; but he was in danger of suffering deeply in the cause. He had been at particular pains to explain an argument used by the Irish on this occasion, viz. that brass

money, being illegal, could not be forced upon the nation by the king, without exceeding the limits of his prerogative. Hence the opposite party took occasion to charge the Irish with a design of casting off their dependence on Britain altogether: but Swift having examined the accusation with freedom, pointed out the encroachments made by the British parliament on the liberties of Ireland; and asserted, that any dependence on England, except that of being subjects to the same king, was contrary to the law of reason, nature, and nations, as well as to the law of the land. This publication was so disagreeable to government, that they offered a reward of L.300 for the discovery of the author; but as nobody could be found who would give him up, the printer was prosecuted in his stead: however, he was unanimously acquitted by a jury of his countrymen.

The Irish continued to be jealous of their liberties, while the British ministry seemed to watch every opportunity of encroaching upon them as far as possible. Apprehensions being entertained of a design upon Ireland by the partisans of the pretender in 1715, a vote of credit to government was passed by the house of commons to a considerable amount. This laid the foundation of the national debt of that kingdom, which was quickly augmented to several hundred thousand pounds; for discharge of which a fund had been provided by administration. An attempt was made during the administration of Lord Carteret (who governed Ireland till 1730), to vest this fund in the hands of his majesty and of his heirs for ever, redeemable by parliament. This was opposed by the patriotic party, who insisted, that it was inconsistent with the public safety, and unconstitutional, to grant it longer than from session to session. In 1731 another attempt was made to vest the same in the crown for 21 years; but when the affair came to be debated, the strength of both parties was found to be equally balanced. Immediately before the vote, however, Colonel Tottenham having rode post on the occasion, arrived in the house, and determined the question against government.

The behaviour of Lord Chesterfield, who was made governor of Ireland in 1745, is highly extolled on account of his moderation, and the favour he showed to the liberties of the people. As the apprehensions of government were then very considerable, on account of the rebellion which raged in Scotland, his lordship was advised to augment the military force of Ireland by 4000 men. Instead of this, however, he sent four battalions to the duke of Cumberland, and encouraged the volunteer associations which formed in different parts for the defence of their country. These battalions he replaced by additional companies to the regiments already on the establishment; by which means he saved a considerable expence to the nation, without augmenting the influence of the crown. The supplies asked by him were small, and raised in the most easy and agreeable manner to the people, expending the money at the same time with the utmost economy. There was even a saving, which he applied to the use of the public. It had been a custom with many of the lieutenant governors of Ireland to bestow reversionary grants, in order to purchase the assistance of friends in support of their measures. Lord Chesterfield, how-

Ireland. ever, being convinced that this practice was prejudicial to the interest of the nation, put a stop to it; but the most remarkable part of his administration was, the humanity with which he treated the Roman Catholics. Before his arrival, the Roman chapels in Dublin had been shut up; their priests were commanded by proclamation to leave the kingdom; and such as disobeyed had been subjected to imprisonment and other penalties. Lord Chesterfield, however, convinced that the affection is to be engaged by gentle usage, permitted them to exercise their religion without disturbance. The accusations brought against them of forming plots against government, were disregarded; and so much was his moderation and uprightness in this respect applauded by all parties, that, during the whole time of his administration, the national tranquillity was not once interrupted by the smallest internal commotion. On his leaving the island, his bust was placed at the public expence in the castle of Dublin.

61  
His humanity to the Roman Catholics.

Lord Chesterfield having left Ireland in the spring of 1746, the island continued to be governed by lords justices until the 13th of September, when William earl of Harrington came over with the powers of lord lieutenant. A contest in the election of representatives for the city of Dublin this year called forth the abilities of Mr Charles Lucas, so much celebrated for his patriotic virtues. Having some years before been admitted a member of the common council, he resolved to exert himself in behalf of the privileges of his fellow-citizens. The powers of this city-corporation, as well as of others, had been changed by authority derived from an act in the time of Charles II. and among other innovations, for the purpose of augmenting the influence of the crown, they deprived the commons of the power of choosing the city magistrates. This was now vested in the board of aldermen; which being subject in the exercise of its jurisdiction to the approbation of the privy council, was consequently dependent on government. Mr Lucas complained loudly of the injury; but as this law could not be altered, he set himself to inquire, whether encroachments, which could not be justified by law, had not been made on the rights of the citizens? Having satisfied himself, by searching diligently into ancient records, that his apprehensions were well-founded, he published his discoveries, explained the nature of the evidence resulting from them, and encouraged the people to take the proper steps for obtaining redress.

62  
Account of Mr Lucas the celebrated patriot.

The consequence of this was a contest between the commons and aldermen, which lasted two years. The former struggled in vain to recover their lost privileges; but the exertions of Lucas in every stage of the dispute had rendered him so respectable among his countrymen, that on the death of Sir James Somerville he was encouraged to declare himself a candidate for a seat in parliament. This being highly agreeable to his wishes, he was elected accordingly; and distinguished himself not only by the boldness and energy of his speeches, but more especially by a number of addresses to his countrymen. In some of these he particularly considered the several branches of the constitution, and pointed out the encroachments of the British legislature. Government, alarmed at his boldness, determined to crush him by the hand of power; for which

reason the most obnoxious paragraphs were extracted from his works, and made the foundation of a charge before parliament. The commons voted him an enemy to his country; and addressed the lord lieutenant for an order to prosecute him by the attorney-general. The universal esteem in which he was held could not screen him from ministerial vengeance: he was driven from Ireland; but having spent some years in banishment, he was once more enabled, through the exertions of his friends, to present himself as a candidate for the city of Dublin. Being again elected, he continued to distinguish himself by the same virtuous principles for which he had been from the beginning so remarkable, and died with the character which he had preserved through life, of the *incomparable* Lucas.

63  
Dispute with government concerning previous consent.

In the year 1753, a remarkable contest took place betwixt government and the Irish parliament relative to previous consent. As the taxes for defraying state expences are imposed by the representatives of the people, it thence naturally follows, that they have a right to superintend the expenditure of them; and by an inspection of the journals of the house of commons, it appeared, that from the year 1692 they had exercised a right of calling for and examining the public accounts. When any surplus remained in the treasury, it was also customary to dispose of it by bill for the good of the public. In the year 1749, however, a considerable sum having remained in the treasury, the disposal of this money in future became an object to ministry. In 1751, it was intimated to parliament by the lord lieutenant, the duke of Dorset, that his majesty would graciously consent and recommend it to them, that such part of the money as then remained in the treasury should be applied to the reduction of the national debt." As this implied a right inherent in his majesty to dispose of the money as he thought proper, the proposal was accounted an invasion of the privileges of the house of commons. No notice was therefore taken of the direction given by Dorset, but the bill was sent over to England as usual without any notice taken of his majesty's consent. In England, however, this very material alteration was made, and the word *consent* introduced into it. The commons at this time did not take any notice of such an essential alteration; but next year, on its being repeated, the bill was rejected. Government were now at the utmost pains to defend the measure they had adopted, and pamphlets were published in which it was justified on various grounds. The event at last, however, was, that his majesty by letter took the money which had been the subject of dispute out of the treasury.

6  
Invasion of Thurston 1760.

In the year 1760 Ireland sustained an inconsiderable hostile invasion, the first that had been experienced in the kingdom for 70 years. The armament consisted originally of five ships; one of 48 guns, two of 36, and two of 24; having on board 1270 land-forces. They were commanded by the celebrated Thurot, whose reputation, as captain of a privateer, had advanced him to this dignity. The Squadron, however, was driven by adverse winds to Gottenburgh; where having continued a few days, they set sail for the place of their destination. On their arrival at the coast of Ireland, they were obliged to shelter themselves in Lough Foyle from a violent storm which again overtook them. The wind, however, having shifted, and continuing to blow

blow tempestuously, they were obliged to keep out to sea. Two of the ships were thus separated from the rest by the violence of the storm, and returned to France; but the remaining three directed their course to the island of Ilay, where they anchored; and having repaired their damages, took in a supply of provisions, and thence sailed to Carrickfergus.

In the mean time, an officer belonging to the small number of troops at that time in Carrickfergus took post on a rising ground, with an advanced party, to observe the motions of the enemy. A skirmish ensued betwixt this party and Thurot's men, until the former, having expended all their ammunition, were obliged to retire into the town. Having in vain attempted to prevent the enemy from taking possession of it, the British troops shut themselves up in the castle, where they were soon obliged to capitulate, after having killed about 100 of their enemies, with the loss of only three on their own part. The French having plundered the town, set sail on the 26th of February; and three days after were all taken by Captain Elliot, Thurot himself being killed in the engagement.

Soon after the accession of George III. Ireland first began to be disturbed by a banditti who styled themselves *White Boys*; and as these were generally of the Romish persuasion, the prejudices against that sect broke forth in the usual manner. A plot was alleged to have been formed against government; French and Spanish emissaries to have been sent over to Ireland, and actually to be employed to assist in carrying it into execution. The real cause of this commotion, however, was as follows: About the year 1739 the murrain broke out among the horned cattle in the duchy of Holstein, from whence it soon after spread through the other parts of Germany. From Germany it reached Holland, from whence it was carried over to England, where it raged with great violence for a number of years. The mitigation of the penal laws against the Papists about this time encouraged the natives of the south of Ireland to turn their thoughts towards agriculture, and the poor began to enjoy the necessaries of life in a comfortable manner. A foreign demand for beef and butter, however, having become uncommonly great, by reason of the cattle distemper just mentioned, ground appropriated to grazing became more valuable than that employed in tillage. The cotters were every where dispossessed of their little possessions, which the landlords let to monopolizers who could afford a higher rent. Whole baronies were now laid open to pasturage, while the former inhabitants were driven desperate by want of subsistence. Numbers of them fled to the large cities, or emigrated to foreign countries, while those who remained took small spots of land, about an acre each, at an exorbitant price, where they endeavoured if possible to procure the means of protracting a miserable existence for themselves and families. For some time these poor creatures were allowed by the more humane landlords the liberty of commonage; but afterwards this was taken away, in despite of justice and a positive agreement; at the same time, the payment of tithes, and the low price of labour, not exceeding the wages in the days of Queen Elizabeth, aggravated the distresses of the unhappy sufferers beyond measure.

In such a situation, it is no wonder that illegal me-

thods were pursued in expectation of redress. The people, covered with white skirts, assembled in parties at night, turned up the ground, destroyed bullocks, levelled the inclosures of the commons, and committed other acts of violence. These unavailing efforts were construed into a plot against the government; numbers of the rioters were apprehended in the counties of Limerick, Cork, and Tipperary, and some of them condemned and executed. In different places these unhappy wretches, instead of being looked upon as objects of compassion, were prosecuted with the utmost severity. Judge Aston, however, who was sent over to try them, executed his office with such humanity as did him the highest honour. A most extraordinary and affecting instance of this was, that on his return from Dublin, for above ten miles from Clonmell, both sides of the road were lined with men, women, and children; who, as he passed along, kneeled down and implored the blessing of heaven upon him as their guardian and protector.

In the mean time, the violences of the White Boys continued, notwithstanding that many examples were made. The idea of rebellion was still kept up; and, without the smallest foundation, gentlemen of the first rank were publicly charged with being concerned in it, inasmuch that some of them were obliged to enter bail, in order to protect themselves from injury. The Catholics of Waterford gave in a petition to Lord Hertford, the governor in 1765, in behalf of themselves and brethren, protesting their loyalty and obedience to government; but no effectual step was taken either to remove or even to investigate the cause of the disturbances.

About two years after the appearance of the White Boys, a similar commotion arose in Ulster; which, however, proceeded in part from a different cause, and was of much shorter duration. By an act of parliament, the making and repairing of highways in Ireland was formerly a grievous oppression on the lower ranks of people. An housekeeper who had no horse was obliged to work at them six days in the year; and if he had a horse, the labour of both was required for the same space of time. Besides this oppression, the poor complained that they were frequently obliged to work at roads made for the convenience of individuals, and which were of no service to the public. Nor were these the only grievances of which the insurgents at this time complained: the tythes exacted by the clergy were said to be unreasonable, and the rent of lands was more than they could bear. In 1763, therefore, being exasperated by a road proposed to be made thro' a part of the county of Armagh, the inhabitants most immediately affected by it rose in a body, and declared that they would make no more highways of the kind. As a mark of distinction, they wore oak-branches in their hats, from which circumstance they called themselves *Oak-boys*. The number of their partizans soon increased, and the insurrection became general through the counties of Armagh, Tyrone, Derry, and Fermanagh. In a few weeks, however, they were dispersed by parties of the military; and the public tranquillity was restored with the loss of only two or three lives. The road-act, which had been so justly found fault with, was repealed next session; and it was determined, that for the future the roads should

Ireland. be made and repaired by a tax to be equally assessed on the lands of the rich and poor.

67  
Of the Steel  
Boys.

Besides these, another set of insurgents called *Steel-boys* soon made their appearance, on the following account. The estate of an absentee nobleman happening to be out of lease, he proposed, instead of an additional rent, to take fines from his tenants. Many of those, who at that time possessed his lands, were unable to comply with his terms; while others who could afford to do so, insisted upon a greater rent from the immediate tenants than they were able to pay. The usual consequences of this kind of oppression instantly took place. Numbers being dispossessed and thrown destitute, were forced into acts of outrage similar to those already mentioned. One of these charged with felony was carried to Belfast, in order to be committed to the county gaol; but his associates, provoked by the usage they had received, determined to relieve him. The design was eagerly entered into by great numbers all over the country; and several thousands, having provided themselves with offensive weapons, proceeded to Belfast in order to rescue the prisoners. To prevent this, he was removed to the barracks and put under the guard of a party of soldiers quartered there; but the *Steel-boys* pressed forward with a determination to accomplish their purpose by force, and some shots were actually exchanged between them and the soldiers. The consequences would undoubtedly have been fatal, had it not been for a physician of highly respectable character, who interposed at the risk of his life, and prevailed on those concerned to set the prisoner at liberty. The tumult, however, was not thus quelled. The number of insurgents daily increased, and the violences committed by them were much greater than those of the other two parties. Some were taken and tried at Carrickfergus, but none condemned. It was supposed that the fear of popular resentment had influenced the judges; for which reason an act was passed, enjoining the trial of such prisoners for the future to be held in counties different from those where the crimes were committed. This breach of a fundamental law of the constitution gave such offence, that though several of the *Steel-boys* were afterwards taken up and carried to the castle of Dublin, no jury would find them guilty. This obnoxious law was therefore repealed; after which some of the insurgents, being tried in their respective counties, were condemned and executed. Thus the commotions were extinguished: but as no methods were taken to remove the cause, the continued distress of the people drove many thousands of them into America in a very few years.

68  
Parliament  
of Ireland  
made oc-  
cennial.

In the mean time a very material alteration had taken place, in the constitution of the kingdom, with regard to the duration of parliaments. At an early period these had continued only for a year; but afterwards they were prolonged until the death of a sovereign, unless he chose to dissolve it sooner by an exertion of his prerogative. Thus, from the moment of their election, the commons of Ireland were in a manner totally independent of the people and under the influence of the crown; and government soon availed itself of this power to bribe a majority to serve its own purposes. Various methods were thought of to remedy this evil; but all proved ineffectual until the

year 1768, when, during the administration of Lord Townshend, a bill was prepared and sent over to England, by which it was enacted, that the Irish parliaments thenceforth should be held every seven years. It was returned with the addition of one year; and ever since the parliaments of this country have been octennial. During this session an attempt was made by the British ministry to infringe the rights of the house of commons in a very material point. A money-bill, which had not originated in Ireland, was sent over from Britain, but was rejected in a spirited manner. Its rejection gave great offence to the Lord Lieutenant, who repeatedly prorogued them till the year 1771.

Irel  
An En  
money  
rejecte

The affairs of Ireland began now to draw towards that crisis which effected the late remarkable revolution in favour of the liberties of the people. The passing of the octennial bill had diminished, but not taken away, the influence of the crown; and the situation of affairs between Britain and America had inclined ministry to make the most of this influence they could. In 1773 Lord Harcourt, at that time governor of Ireland, exerted himself so powerfully in favour of administration, that the voice of opposition in parliament was almost entirely silenced. The difficulties, however, under which the whole nation laboured began now to be so severely felt, that an address on the subject was presented by the commons to his excellency. In this they told him, that they hoped he would lay before the king the state of Ireland, restricted in its commerce from the short-sighted policy of former times, to the great injury of the kingdom, and the advantage of the rivals, if not of the enemies, of Great Britain. These hardships, they said, were not only impolitic, but unjust; and they told his excellency plainly, that they expected to be restored to some, if not to all their rights, which alone could justify them to their constituents for laying upon them so many burdens during the course of this session.

nant.

This representation to the Lord Lieutenant produced no effect; and Ireland for some years longer continued to groan under the burden of intolerable restrictions. These had principally taken place in the reign of Charles II. At this time it was enacted, that beef or live cattle should not be exported to England; neither were the commodities of Ireland to be exported to the American colonies, nor American goods to be imported to any port in Ireland without first unloading them in some part of England or Wales. All trade with Asia was excluded by charters granted to particular companies; and restrictions were imposed upon almost every valuable article of commerce sent to the different parts of Europe. Towards the end of King William's reign an absolute prohibition was laid on the exportation of Irish wool. This restriction proved disadvantageous not only to Ireland, but to Great Britain herself. The French were now plentifully supplied by smuggling with Irish wool; and not only enabled to furnish woollen stuffs sufficient for their own consumption, but even to vie with the British in foreign markets. Other restrictions conspired to augment the national calamity; but that which was most sensibly felt took place in 1776. "There had hitherto (says Mr Crawford) been exported annually to America large quantities of Irish linens: this very

trade.

considerable source of national advantage was now shut up, under pretence of rendering it more difficult for the enemy to be supplied with the means of subsistence; but in reality, to enable a few rapacious English contractors to fulfil their engagements, an embargo, which continued, was in 1776 laid upon the exportation of provisions from Ireland, by an unconstitutional stretch of prerogative. Remittances to England, on various accounts, particularly for the payment of our forces abroad, were more than usually considerable. These immediate causes being combined with those which were invariable and permanent, produced in this country very calamitous effects. Black cattle fell very considerably in their value; notwithstanding that customers could not be had. The price of wool was reduced in a still greater proportion. Rents every where fell; nor, in many places, was it possible to collect them. An universal stagnation of business ensued. Credit was very materially injured. Farmers were pressed by extreme necessity, and many of them failed. Numbers of manufacturers were reduced to extreme necessity, and would have perished, had they not been supported by public charity. Those of every rank and condition were deeply affected by the calamity of the times. Had the state of the exchequer permitted, grants might have been made to promote industry, and to alleviate the national distress; but it was exhausted to a very uncommon degree. Almost every branch of the revenue had failed. From want of money the militia law could not be carried into execution. We could not pay our forces abroad; and, to enable us to pay those at home, there was a necessity for borrowing 50,000*l.* from England. The money which parliament was forced to raise, it was obliged to borrow at an exorbitant interest. England, in its present state, was affected with the wretched condition to which our affairs were reduced. Individuals there, who had estates in Ireland, were sharers of the common calamity; and the attention of individuals in the British parliament was turned to our situation, who had even no personal interest in this country."

While things were in this deplorable situation, earl Nugent, in the year 1778, undertook the cause of the Irish, by moving in parliament, that their affairs should be taken into consideration by a committee of the whole house. This motion being agreed to almost unanimously, it was followed by several others, viz. That the Irish might be permitted to export directly to the British plantations, or to the settlements on the coast of Africa, all goods being the produce and manufacture of the kingdom, excepting only wool, or woollen manufactures, &c. That all goods, being the produce of any of the British plantations, or of the settlements on the coast of Africa, tobacco excepted, be allowed to be imported directly from Ireland to all places, Britain excepted. That cotton yarn, the manufacture of Ireland, be allowed to be imported into Great Britain. That glass manufactured in Ireland be permitted to be exported to all places, Britain excepted.—With respect to the Irish mill cloth and cordage, it was moved, that they should have the same privilege as for the cotton yarn.

These motions having passed unanimously, bills for the relief of Ireland were framed upon them according-

ly. The trading and manufacturing towns of England, however, now took the alarm, and petitions against the Irish indulgence were brought forward from many different quarters, and members instructed to oppose it. In consequence of this a warm contest took place on the second reading of the bills. Mr Burke supported them with all the strength of his eloquence; and as the minister seemed to favour them, they were committed; though the violent opposition to them still continued, which induced many of their friends at that time to desert their cause.

Though the efforts of those who favoured the cause of Ireland thus proved unsuccessful for the present, they renewed their endeavours before the Christmas vacation. They now urged, that, independent of all claims from justice and humanity, the relief of Ireland was enforced by necessity. The trade with British America was now lost for ever; and it was indispensably requisite to unite the remaining parts of the empire in one common interest and affection. Ireland had hitherto been passive; but there was danger that, by driving her to extremities, she would cast off the yoke altogether; or, even if this should not happen, the tyranny of Britain would be of little advantage; and, in the event of a peace, the people would desert a country in which they had experienced such oppression, and emigrate to America, where they had a greater prospect of liberty. On the other hand, they insisted, that very considerable advantages must ensue to Britain by the emancipation of Ireland; and every benefit extended to that country would be returned with accumulated interest. The business was at last summed up in a motion made by lord Newhaven, in February 1779, that liberty should be granted to the Irish to import sugars from the West Indies. This was carried; but the merchants of Glasgow and Manchester having petitioned against it, it was again lost through the interference of the minister, who now exerted his influence against the relief he had formerly declared in favour of. Various other efforts, however, were made to effect the intended purpose; but nothing more could be obtained than a kind of compromise, by which lord Gower pledged himself, as far as he could answer for the conduct of others, that, during the recess, some plan should be fallen upon for accommodating the affairs of Ireland to the satisfaction of all parties.

In the mean time the affairs of this country hastened to a crisis; which forced the British ministry to give that relief so long solicited, and which they so often promised without any intention of performing their promise. As long as the affairs of the country were under consideration of the British parliament, the inhabitants preserved some degree of patience; but, when they found themselves deserted by the minister, their discontent was inflamed beyond measure. The laws he had passed in their favour, viz. an allowance to plant tobacco, and a bill for encouraging the growth of hemp, were considered as mockery instead of relief, and it was now resolved to take such measures as should effectually convince the ministry that it was not their interest to tyrannize any longer. With this view, associations against the importation of British commodities, which had been entered into in some places before, now became universal throughout the kingdom; and such

Associations formed against importing British commodities.

Irish d. as presumed to oppose the voice of the people in this respect, had the mortification to find themselves exposed to public obloquy and contempt on that account. Thus the Irish manufactures began to revive; and the people of Britain found themselves obliged seriously to take into consideration the relief of that country, and to look upon it as a matter very necessary to their own interest. To this also they were still more seriously disposed by the military associations, which had taken place some time before, and now assumed a most formidable appearance. These at first were formed by accidental causes. The situation of Britain, for some time, had not admitted of any effectual method being taken for the defence of Ireland. Its coasts had been insulted, and the trading ships taken by the French and American privateers; nor was it at all improbable that an invasion might soon follow. "The minister (says Mr Crawford) told us, that the situation of Britain was such as rendered her incapable of protecting us. The weakness of government, from the following circumstance, was strikingly obvious. The mayor of Belfast having transmitted a memorial to the Lord Lieutenant, setting forth the unprotected state of the coast, and requesting a body of the military for its defence, received for answer, that he could not afford him any other assistance than half a troop of dismounted horse and half a company of invalids." In this dilemma, a number of the inhabitants of the town associated for the purpose of self-defence; and, on the same principle, a few volunteer companies were formed in different parts of the kingdom. These chose their own officers, purchased their own uniforms and arms, and, with the assistance of persons properly qualified, assembled regularly on the parade to acquire a knowledge in the military art. Their respectable appearance, and the zeal they showed in the service of their country, soon excited curiosity and attracted respect. Their number increased every day; and people of the first consequence became ambitious of being enrolled among them. As no foreign enemy appeared, against whom they might exercise their military prowess, these patriotic bands soon began to turn their thoughts towards a deliverance from domestic oppression. No sooner was this idea made known, than it gave new vigour to the spirit of volunteering; inasmuch that, by the end of 1778, the military associations were thought to amount at least to 30,000 men. But, while thus formidable from their numbers, and openly avowing their intention to demand a restitution of their rights from the British ministry, they professed the utmost loyalty and affection to the king; and with regard to sobriety and decent demeanour, they were not only unexceptionable, but exemplary. Instead of exciting disorders themselves, they restrained every kind of irregularity, and exerted themselves with unanimity and vigour for the execution of the laws.

That such a body of armed men, acting without any command or support from government, should be an object of apprehension to ministry, is not to be wondered at. In the infancy of their associations indeed they might have been suppressed; but matters had been suffered to proceed too far; and, as they stood at present, all resistance was vain. As the volunteers could not be controuled, some attempts were made to bring them under the influence of the crown; but this being

found impossible, ministry thought proper to treat them with an appearance of confidence; and, accordingly, orders were issued for supplying them with 16,000 stand of arms.

The Irish parliament, thus encouraged by the spirit of the nation, and pressed by the difficulties arising from the diminished value of their estates, resolved to exert themselves in a becoming manner, in order to procure relief to their country. At their meeting in October 1779, an address to his Majesty was drawn up; in which it was expressly declared, that "it was not by temporary expedients, but by a free trade alone, that Ireland was now to be saved from impending ruin." When this address was carried up to the Lord Lieutenant, the streets of Dublin were lined with volunteers, commanded by the duke of Leinster, in their arms and uniform. But, though a general expectation of relief was now diffused, an anxious fear of disappointment still continued. If the usual supply was granted for two years, there was danger of the distresses continuing for all that time; and after it was granted, the prorogation of parliament might put a stop to the expected relief altogether. The people, however, were not now to be trifled with. As the court-party showed an aversion to comply with the popular measures, a mob rose in Dublin, who, among other acts of violence, pulled down the house of the attorney-general, and did their utmost to compel the members to promise their countenance to the matter in hand. When the point therefore came to be debated, some espoused the popular side from principle, others from necessity; so that on the whole a majority appeared in favour of it. A short money bill was passed and transmitted to England; where, though very mortifying to the minister, it passed also.

On the meeting of the British parliament in December, the affairs of Ireland were first taken into consideration in the house of peers. The necessity of granting relief to that kingdom was strongly set forth by the lord who introduced them. He said, the Irish, now conscious of possessing a force and consequence to which they had hitherto been strangers, had resolved to apply it to obtain the advantages of which the nation, by this spirited exertion, now showed themselves worthy. Had they for some time before been gratified in lesser matters, they would now have received with gratitude, what they would, as affairs stood at present, consider only as a matter of right. He then moved for a vote of censure on his Majesty's ministers for their neglect of Ireland. This motion was rejected; but Earl Gower, who had now deserted the cause of ministry, declared, that there did not exist in his mind a single doubt that the vote of censure was not well founded. He added, in his own vindication, that early in the summer he had promised that relief should be granted to Ireland, and had done every thing in his power to keep his word; but that all his efforts had proved fruitless.

In the house of commons the minister found himself so hard pressed by the arguments of the minority, and the short money-bill from Ireland, that he was obliged to declare, that in less than a week he intended to move for a committee of the whole house to take the affairs of Ireland into consideration. On the 13th of December he accordingly brought forward his propositions

Britain.

positions in favour of this kingdom. The design of these was to repeal the laws prohibiting the exportation of Irish manufactures made of wool or wool blocks; to repeal as much of the act of 19th Geo. II. as prohibited the importation of glass into Ireland, except of British manufacture, or the exportation of glass from Ireland; and to permit the Irish to export and import commodities to and from the West Indies and the British settlements on the coast of Africa, subject to such resolutions and restrictions as should be imposed by the Irish parliament.

On these propositions his lordship made several remarks by way of explanation. One object of them, he said, was to restore to Ireland the wool export and woollen manufacture. In 1692, from jealousy or some other motive, an address had been presented by the English parliament, recommending a kind of compact between the two kingdoms; the terms of which were, that England should enjoy the woollen manufacture, and Ireland the linen, exclusively. But notwithstanding this agreement, it was certain, that England carried on the linen manufacture to as great extent as Ireland, while at the same time the former retained the monopoly of woollens. The first step taken, in consequence of this agreement, was to lay a heavy duty, equal to a prohibition, upon all wool and woollens exported; and when this act, which was but a temporary one by way of experiment, expired, the English parliament passed a similar one, and made it perpetual; by means of which and some others a total end was put to the woollen trade of Ireland.

With regard to the trade of Ireland, his lordship observed, that, upon an average of the six years from 1766 to 1772, the export to Ireland was somewhat more than two millions; and, in the succeeding six years, from 1772 to 1778, about as much more; nearly one half being British manufacture and produce; the other half certified articles, of which this country was the medium of conveyance. The native produce, on an average, was somewhat more than 900,000*l.* but of this only 200,000*l.* were woollens. The woollen manufacture of Ireland therefore would long continue in a state of infancy; and though cloths had been manufactured sufficient for home consumption, yet it could hardly be expected that Ireland would rival Great Britain at the foreign markets, when, after the expence of land-carriage, freight, insurance, and factorage, the latter was able to undersell Ireland in her own market on the very spot, even though aided by the low wages and taxes paid in the country.

With regard to the linen, his lordship observed, that however prosperous it might appear, yet still it was capable of great improvement. The idea of extending and improving the linen-manufacture of Ireland originated from a pamphlet written by Sir William Temple; and this gave rise to the compact which had been referred to. But though this compact was now about to be dissolved, it was his opinion that the bounties on importing Irish linens ought not to be discontinued; because it appeared, that the British bounties had operated as a great encouragement to the Irish manufactures, at the same time that the sum appropriated to this purpose amounted to more than 13,000*l.*

With regard to the dissolution of the compact be-

twixt England and Ireland, he observed, that, as a more liberal spirit had now appeared on both sides of the water, he hoped both kingdoms would be perfectly contented. Ireland would never be able to rival England in the fine woollen fabrics; but allowing the Irish to manufacture their own wool, would put an end to the contraband trade with France; and it ought to be remembered, that whatever was an advantage to Ireland, must, sooner or later, be of singular advantage to Great Britain, and by the proposed regulations in their commercial connections, the two kingdoms would be put more upon an equality.

With regard to the glass manufacture, his lordship likewise observed, that Ireland had been very injuriously treated. Before the act of 19th Geo. II. they had begun to make some progress in the lower branches of the glass manufacture; but by that act they were not only prevented from importing any other glass than what was of British manufacture, but also from exporting their own glass, or putting it on a horse or carriage with a design to be exported. This act had been complained of in Ireland as a great piece of injustice, and it was the intention of his proposition to remove that grievance.

With regard to the third proposition, his lordship observed, that allowing Ireland a free trade to the colonies must be considered as a favour to that kingdom. Considering her even as an independent state, she could set up no claim to an intercourse with the British colonies. By every principle of justice, of the laws of nations, and the custom of the other European powers who had settlements and distant dependencies, the mother country had an exclusive right to trade with, and to forbid all others from having any intercourse with them. Were not this the case, what nation under the sun would spend their blood and treasure in establishing a colony, and protecting and defending it in its infant state, if other nations were afterwards to reap the advantages derived from their labour, hazard, and expence. But though Great Britain had a right to restrain Ireland from trading with her colonies, his lordship declared himself of opinion that it would be proper to allow her to participate of the trade. This would be the only prudent means of affording her relief; it would be an unequivocal proof of the candour and sincerity of Great Britain; and he had not the least doubt but it would be received as such in Ireland. Britain, however, ought not to be a sufferer by her bounty to Ireland; but this would be the case, should the colony trade be thrown open to the latter, without accompanying it with restrictions similar to those which were laid upon the British trade with them. An equal trade must include an equal share of duties and taxes; and this was the only proper ground on which the benefits expected by the Irish nation could be either granted or desired.

Having made some other observations on the propriety of these measures, they were regularly formed into motions, and passed unanimously. In Ireland they were received with the utmost joy and gratitude by both houses of parliament. On the 20th of December the following resolutions were passed; viz. That the exportation of woollen and other manufactures from Ireland to all foreign places will materially tend to relieve its distresses, increase its wealth, promote

88  
They are  
received  
with great  
joy by the  
Irish.

**Ireland.** its prosperity, and thereby advance the welfare of Britain, and the common strength, wealth, and commerce of the British empire; that a liberty to trade with the British colonies in America and the West Indies, and the settlements on the coast of Africa, will be productive of very great commercial benefits: will be a most affectionate mark of the regard and attention of Great Britain to the distresses of the kingdom; and will give new vigour to the zeal of his Majesty's brave and loyal people of Ireland to stand forth in support of his Majesty's person and government, and the interest, the honour, and dignity of the British empire." The same resolutions were, next day, passed in the house of peers.

89  
Excessive eulogiums on Lord North to the disadvantage of the minority in parliament.

The highest encomiums were now passed on Lord North. His exertions in favour of Ireland were declared to have been great and noble; he was styled "the great advocate of Ireland;" and it was foretold, that he would be of glorious and immortal memory in that kingdom. But while these panegyrics were so lavishly made on the minister, the members in opposition, in the British parliament, were spoken of in very indifferent terms. It was said, that, while they thought the minister did not mean to go into the business of Ireland, they called loudly for censure against him for not doing it; but when it was found that he meant seriously to take their affairs into consideration, they had then basely seceded, and wholly forsaken the interest of the kingdom. These censures were so loud, that a member of the British house of commons wrote a letter to be communicated to his friends in Ireland, in which he represented, that however politic it might be to compliment the minister on the present occasion, it was neither very wise nor generous in the members of the Irish parliament to be so ready in bestowing invectives against their old friends in England. With regard to the minister, it was alleged, that until he was driven to it by the measures adopted in Ireland, his conduct had been extremely equivocal, dilatory, and indecisive. The minority had been justly incensed against him for having so grossly sacrificed the honour of the nation and the dignity of parliament as to refuse any substantial relief to the Irish, until their own exertions had made it appear that every thing which could be done for them by the British parliament was not a matter of choice but of necessity. The minority, it was said, had earnestly and repeatedly laboured to procure relief for the people of Ireland; and if they had now contented themselves with a silent acquiescence in the minister's propositions, it was only until they should know whether they would be satisfactory to the people of Ireland; and because what was now done, appeared to be more an act of state than of mere parliamentary deliberation and discussion.

90  
They are checked by a letter from a member of the British house of commons.

91  
Additional propositions in favour of Ireland.

To the propositions already mentioned, Lord North added three others. 1. For repealing the prohibition of exporting gold coin from Great Britain to Ireland. 2. For removing the prohibition to import foreign hops into Ireland, and the drawback on the exportation of foreign hops. 3. For enabling his majesty's Irish subjects to become members of the Turkey company, and to export woollens in British or Irish bottoms to the Levant. In support of this last resolution his lordship urged, that it was necessary, because the

exportation of woollens having been granted to Ireland, the Irish would naturally expect a share in the Turkey trade, which, as matters stood, was not possible, it having hitherto been a received opinion, that no Irishman could be elected a member of the Turkey company. Notwithstanding all the satisfaction, however, with which the news of these bills were received in Ireland, it was not long before thoughts of a different kind began to take place. It was suggested, that a free trade could be but of little use, if held by a precarious tenure. The repeal of the obnoxious laws was represented as an act of necessity, not of choice, on the part of the British parliament. When that necessity, therefore, no longer existed, the same parliament might recal the benefits it had granted, and again fetter the Irish trade by restrictions perhaps more oppressive than before. To secure the advantages they now possessed, it was necessary that the kingdom should enjoy the benefits of a free constitution. For this the people looked up to the volunteer companies; and the idea of having such a glorious object in their power, augmented the numbers of those which had also been increased from other causes. They had now received the thanks of both houses of parliament, and thus had obtained the sanction of the legislature. Thus many who had formerly scrupled to connect themselves with a lawless body, made no scruple to enter their lists. Government also engaged several of their friends in the volunteer cause. New companies were therefore raised; but whatever might be the political sentiments of the officers, the private men were universally attached to the popular cause. The national spirit was likewise kept up by several patriotic publications, particularly the letters signed Owen Roe O'Neil, which in an especial manner attracted the public attention; nor was the pulpit backward in contributing its part in the same cause.

92  
New dissenting companies in the place.

93  
Number of the volunteers increased.

To give the greater weight to their determinations, the volunteers now began to form themselves into battalions; and in a very short time they were all united in this manner, excepting a small number of companies, which, from accidental causes, continued separate. The newspapers were filled with resolutions from the several corps, declaring Ireland to be an independent kingdom, intitled by reason, nature, and compact, to all the privileges of a free constitution; that no power in the world, excepting the king, with the lords and commons of Ireland, had or ought to have, power to make laws for binding the Irish; and that, in support of these rights and privileges, they were determined to sacrifice their lives and property.

94  
They formed themselves into battalions.

95  
Ireland declared an independent kingdom.

Notwithstanding all this zeal, however, the representatives of the people in Ireland seem yet to have behaved in a very supine and careless manner, and to have been entirely obedient to the dictates of government. One of the house of commons declared in the month of April 1780, that "no power on earth, excepting the king, lords, and commons of Ireland, had a right to make laws to bind the people." "Every member in the house (says Mr Crawford), one excepted, acknowledged the truth of the proposition, either in express terms, or by not opposing it; and yet, however astonishing it may appear, it was evident, that had the question been put, it would have been carried in the

96  
Service behaviour the Irish parliament.

and the negative. The matter was compromised. The question was not put; and nothing relating to it was entered on the journals.

This inattention, or rather unwillingness, of the majority to serve their country, was more fully manifested in the case of a mutiny bill, which they allowed to be made perpetual in Ireland, though that in England had always been cautiously passed only from year to year. After it was passed, however, some of the zealous patriots, particularly Mr Grattan, took great pains to set forth the bad tendency of that act. He observed, that standing armies in the time of peace were contrary to the principles of the constitution and the safety of public liberty; they had subverted the liberty of all nations excepting in those cases where their number was small, or the power of the sovereign over them limited in some respect or other; but it was in vain to think of setting bounds to the power of the chief magistrate, if the people chose by a statute to bind themselves to give them a perpetual and irresistible force. The mutiny bill, or martial law methodized, was directly opposite to the common law of the land. It set aside the trial by jury and all the ordinary steps of law; establishing in their stead a summary proceeding, arbitrary crimes and punishments, a secret sentence, and sudden execution. The object of this was to bring those who were subject to it to a state of implicit subordination, and render the authority of the sovereign absolute. The people of England, therefore, from a laudable jealousy on all subjects in which their liberty was concerned, had in the matter of martial law exceeded their usual caution. In the preamble to the mutiny act, they recited part of the declaration of right, "that standing armies and martial law in time of peace, without the consent of parliament, are illegal. Having then stated the purity and simplicity of their ancient constitution, and set forth the great principle of magna charta, they admitted a partial and temporary repeal of it: they admitted an army, and a law for its regulation, but at the same time they limited the number of the former, and the duration of both; confining the existence of the troops themselves, the law that regulated them, and the power that commanded them, to one year. Thus were the standing forces of England rendered a parliamentary army, and the military rendered effectually subordinate to the civil magistrate, because dependent on parliament. Yet the people of England considered the army, even thus limited, only as a necessary evil, and would not admit even of barracks, lest the soldier should be still more alienated from the state of a subject; and in this state of alienation have a post of strength, which would augment the danger arising from his situation. When the parliament of Ireland proceeded to regulate the army, therefore, they ought to have adopted the maxims of the British constitution, as well as the rules of British discipline. But they had totally departed from the maxims and example of the English, and that in the most important concern, the government of the sword. They had omitted the preamble which declared the great charter of liberty; they had left the number of forces in the breast of the king, and under these circumstances they had made the bill perpetual.

It is probable that the bulk of the Irish nation did

not at first perceive the dangerous tendency of the bill in question. The representations of Mr Grattan and others, however, soon opened their eyes, and a general dissatisfaction took place. This was much increased by two unsuccessful attempts in the house of commons; one to obtain an act for modifying Poyning's law; and the other for securing the independency of the judges. A universal disgust against the spiritless conduct of parliament now took place; and the hopes of the people were once more set on the volunteers.

As it became now somewhat probable that these companies might at last be obliged to assert the rights of their countrymen by force of arms, reviews were judged necessary to teach them how to act in larger bodies, and to give them a more exact knowledge of the use of arms. Several of these reviews took place in the course of summer 1780. The spectators in general were struck with the novelty and grandeur of the sight; the volunteers became more than ever the objects of esteem and admiration, and their numbers increased accordingly. The reviews in 1781 exceeded those of the former year; and the dexterity of the corps who had associated more early was now observed to be greater than that of the rest. More than 5000 men were reviewed at Belfast, whose performances were set off to peculiar advantage by the display of 13 pieces of cannon. They showed their alacrity to serve their country in the field, on a report having arisen that the kingdom was to be invaded by the combined fleets of France and Spain; and for their spirited behaviour on this occasion they received a second time the thanks of both houses of parliament.

Such prodigious military preparations could not but alarm the British ministry in the highest degree; and it was not to be doubted that the Irish volunteers would come to the same extremities the Americans had done unless their wishes were speedily complied with. Still, however, it was imagined possible to suppress them, and it was supposed to be the duty of the lord lieutenant to do so. It was during the administration of the duke of Buckingham that the volunteers had grown into such consequence: he was therefore recalled, and the earl of Carlisle appointed in his place. Though it was impossible for the new governor to suppress the spirit of the nation, he found it no difficult matter to obtain a majority in parliament. Thus every redress was for the present effectually denied. Neither the modification of Poyning's law, nor the repeal of the obnoxious parts of the mutiny bill, could be obtained. The volunteers, exasperated at this behaviour, resolved at once to show that they were resolved to do themselves justice, and were conscious that they had power to do so. At a meeting of the officers of the southern battalion of the Armagh regiment, commanded by the earl of Charlemont, the following resolutions were entered into December 28th 1781. 1. That the most vigorous and effectual methods ought to be pursued for rooting corruption out from the legislative body. 2. For this purpose a meeting of delegates from all the volunteer associations was necessary; and Dungannon, as the most central town in the province of Ulster, seemed to be the most proper for holding such a meeting. 3. That as many and lasting advantages might attend the holding such a

meeting before the present session of parliament was much farther advanced, the 15th of February next should be appointed for it.

These resolutions proved highly offensive to the friends of government, and every method was taken to discourage it. On the appointed day, however, the representatives of 143 volunteer corps did attend at Dungannon; and the results of their deliberations were as follow. 1. It having been asserted, that volunteers, as such, cannot with propriety debate or publish their opinions on political subjects, or on the conduct of parliament, or public men, it was resolved unanimously, that a citizen, by learning the use of arms, does not abandon any of his civil rights. 2. That a claim from any body of men, other than the king, lords, and commons of Ireland, to make laws to bind the people, is illegal, unconstitutional, and a grievance. 3. Resolved, with one dissenting voice only, that the powers exercised by the privy council of both kingdoms, under colour or pretence of the law of Poyning's, are unconstitutional and a grievance. 4. Resolved unanimously, that the ports of this country are by right open to all foreign countries not at war with the king; and that any burden thereupon, or obstruction thereto, excepting only by the parliament of Ireland, are unconstitutional, and a grievance. 5. Resolved, with one dissenting voice only, that a mutiny bill, not limited in point of duration from session to session, is unconstitutional and a grievance. 6. Resolved unanimously, that the independence of judges is equally essential to the impartial administration of justice in Ireland as in England, and that the refusal or delay of this right is in itself unconstitutional and a grievance. 7. Resolved, with 11 dissenting voices only, that it is the decided and unalterable determination of the volunteer companies to seek a redress of these grievances; and they pledged themselves to their country, and to each other, as freeholders, fellow-citizens, and men of honour, that they would, at every ensuing election, support only those who had supported them, and would support them therein, and that they would use all constitutional means to make such pursuit of redress speedy and effectual. 8. Resolved, with only one dissenting voice, that the minority in parliament, who had supported those constitutional rights, are intitled to the most grateful thanks of the volunteer companies, and that an address to the purpose be signed by the chairman, and published with the resolutions of the present meeting. 9. Resolved unanimously, that four members from each county of the province of Ulster, eleven to be a quorum, be appointed a committee till the next general meeting, to act for the volunteer corps, and to call general meetings of the province as occasion requires. 10. The committee being appointed, and the time of general meetings, and some other affairs of a similar nature settled, it was resolved unanimously, that the court of Portugal having unjustly refused entry to certain Irish commodities, the delegates would not consume any wine of the growth of Portugal, and that they would use all their influence to prevent the use of the said wine, excepting what was then in the kingdom, until such time as the Irish exports should be received in the kingdom of Portugal. 11. Resolved, with only two dissenting voices, that they hold the right of private judgment in mat-

ters of religion equally sacred in others as in themselves; and that they rejoiced in the relaxation of the penal laws against the Papists, as a measure fraught with the happiest consequences to the union and prosperity of the inhabitants of Ireland.

While these proceedings took place at Dungannon, the ministry carried all before them in parliament. In a debate concerning the exclusive legislative privileges of Ireland, a law member, speaking of the arbitrary acts of England, asserted, that "power constituted right;" and a motion that the commons should be declared the representatives of the people was carried in the negative. These scandalous proceedings could not but hasten the ruin of their cause. The resolutions entered into at the Dungannon meeting were received throughout the kingdom with the utmost applause. A few days after, Mr Grattan, whose patriotism has been already taken notice of, moved in the house of commons for a long and spirited address to his majesty, declaring the rights of the kingdom, and asserting the principle which now began to prevail, that Ireland could legally be bound by no power but that of the king, lords, and commons of the country; though the British parliament had assumed such a power. This motion was at present rejected by a large majority; but their eyes were soon enlightened by the volunteers.

These having now appointed their committees of correspondence, were enabled to communicate their sentiments to one another with the utmost facility and quickness. An association was formed in the name of the nobility, representatives, freeholders, and inhabitants of the county of Armagh, wherein they set forth the necessity of declaring their sentiments openly respecting the fundamental and undoubted rights of the nation. They declared, that, in every situation in life, and with all the means in their power, they would maintain the constitutional right of the kingdom to be governed only by the king and parliament of Ireland; and that they would, in every instance, uniformly and strenuously oppose the execution of any statutes, excepting such as derived their authority from the parliament just mentioned; and they pledged themselves, in the usual manner, to support what they now declared with their lives and fortunes.

This declaration was quickly adopted by all the other counties, and similar sentiments became universally avowed throughout the king. The change in the British ministry in the spring of 1782 facilitated the wishes of the people. The duke of Portland, who came over as lord lieutenant in April that year, sent a most welcome message to parliament. He informed them, that, "his majesty, being concerned to find that discontents and jealousies were prevailing among his loyal subjects in Ireland, upon matters of great weight and importance, he recommended it to parliament to take the same into their most serious consideration, in order to such a final adjustment as might give mutual satisfaction to his kingdoms of Great Britain and Ireland."

Mr Grattan, whose patriotic efforts had never been slackened, now ventured to propose a second time in parliament the address which had been rejected before. On the 16th of April he began a speech to this purpose with a panegyric on the volunteers, and the late conduct of the people. The Irish, he said, were no longer

longer a divided colony, but an united land, manifesting itself to the rest of the world in signal instances of glory. In the rest of Europe the ancient spirit was expired; liberty was yielded, or empire lost; nations were living upon the memory of past glory, or under the care of mercenary armies. In Ireland, however, the people, by departing from the example of other nations, had become an example to them. Liberty, in former times, and in other nations, was recovered by the quick feelings and rapid impulse of the populace. But in Ireland, at the present period, it was recovered by an act of the whole nation reasoning for three years on its situation, and then releasing itself by a settled sense of right pervading the land. The meeting of the delegates at Dunganon was an original measure; and, like all of that kind, continued to be matter of surprise, until at last it became matter of admiration. Great measures, such as the meeting of the English at Runny Mead, and of the Irish at Dunganon, were not the consequences of precedent, but carried in themselves both precedent and principle; and the public cause in both instances would infallibly have been lost had it been trusted to parliament. The meeting at Dunganon had resolved, that the claim of the British parliament was illegal; and this was a constitutional declaration. The Irish volunteers were associated for the preservation of the laws, but the conduct of the British parliament subverted all law. England, however, had no reason to fear the Irish volunteers; they would sacrifice their lives in her cause. The two nations formed a general confederacy. The perpetual annexation of the crown was a great bond, but magna charta was a greater. It would be easy for Ireland to find a king; but it would be impossible to find a nation who could communicate to them such a charter as magna charta; and it was this which made their natural connection with England. The Irish nation were too high in pride, character, and power, to suffer any other nation to make their laws. England had indeed brought forward the question, not only by making laws for Ireland the preceding session, but by enabling his majesty to repeal all the laws which England had made for America. Had the consented to repeal the declaratory law against America? and would she refuse to repeal that against Ireland? The Irish nation were incapable of submitting to such a distinction.

Mr Grattan now found his eloquence much more powerful than formerly. The motion which, during this very session, had been rejected by a great majority, was now agreed to after a short debate, and the address to his majesty prepared accordingly. In this, after thanking his majesty for his gracious message, and declaring their attachment to his person and government, they assured him, that the subjects of Ireland are a free people; that the crown of Ireland is an Imperial crown inseparably annexed to that of Britain, on which connection the interests and happiness of both nations essentially depend: but the kingdom of Ireland is distinct, with a parliament of its own; that there is no body of men competent to make laws to bind Ireland, except the king, lords, and commons thereof, nor any other parliament that hath any power or authority of any sort whatsoever, in this country, except the parliament of Ireland. They assured his majesty, that they

humbly conceive, that in this right the very essence of their liberties did exist; a right which they, on the part of all Ireland, do claim as their birthright, and which they cannot yield but with their lives. They assured his majesty, that they had seen with concern certain claims advanced by the parliament of Great Britain, in an act entitled, "For the better securing the dependency of Ireland;" an act containing matter entirely irreconcilable to the fundamental rights of the nation. They informed his majesty, that they conceived this act, and the claims it advanced, to be the great and principal cause of the discontents and jealousies in the kingdom. They assured him, that his commons did most sincerely wish, that all the bills, which become law in Ireland, should receive the approbation of his majesty under the seal of Great Britain; but yet, that they conceived the practice of suppressing their bills in the council of Ireland, or altering them any where, to be another just cause of discontent and jealousy. They further assured his majesty, that an act intitled, "For the better accommodation of his majesty's forces," being unlimited in duration, and defective in some other circumstances, was another just cause of jealousy and discontent. These, the principal causes of jealousies and discontent in the kingdom, they had submitted to his majesty, in humble expectation of redress: and they concluded with an assurance, that they were more confident in the hope of obtaining redress, as the people of Ireland had been, and were, not more disposed to share the freedom of England, than to support her in her difficulties, and to share her fate.

To this remarkable address a most gracious answer was given. In a few days the lord lieutenant made a speech to both houses; in which he informed them, that, by the magnanimity of the king, and wisdom of the British parliament, he was enabled to assure them, that immediate attention had been paid to their representations, and that the legislature of Britain had concurred in a resolution to remove the causes of their discontents, and were united in a desire to gratify every wish expressed in the late address to the throne; and that, in the mean time, his majesty was graciously disposed to give his royal assent to acts to prevent the suppressing of bills in the Irish privy council, and to limit the mutiny-bill to the term of two years.

The joy which now diffused itself all over the kingdom was extreme. The warmest addresses were presented not only to his majesty but to the lord lieutenant. The commons instantly voted 100,000 l. to his majesty, to enable him to raise 20,000 men for the navy; and soon after, 5000 men were likewise voted from the Irish establishment. The volunteers became in a peculiar manner the objects of gratitude and universal panegyric; but none was placed in so conspicuous a light as Mr Grattan. Addresses of thanks flowed in upon him from all quarters; and the commons addressed his majesty to give him 50,000 l. as a recompense of his services; for which they promised to make provision.

This request was also complied with; but still the jealousies of the Irish were not completely eradicated. As the intended repeal of the declaratory act was found to be simple, without any clause expressly relinquishing the claim of right, several members of the house of

commons were of opinion, that the liberties of Ireland were not yet thoroughly secured. The majority, however, were of opinion, that the simple repeal of the obnoxious act was sufficient; but many of the nation at large differed in sentiments. Mr Flood, a member of the house, and a zealous patriot, now took the lead in this matter; while Mr Grattan lost much of his popularity by espousing the contrary opinion. The matter, however, was to appearance finally settled by the volunteers, who declared themselves on Mr Grattan's side. Still some murmurings were heard; and it must be owned, that even yet the conduct of Britain appeared equivocal. An English law was passed, *permitting* importation from one of the West India islands to all his majesty's dominions; and of course including Ireland, though the trade of the latter had already been declared absolutely free. This was looked upon in a very unfavourable light. Great offence was also taken at a member of the English house of lords for a speech in parliament, in which he asserted, that Great Britain had a right to bind Ireland in matters of an external nature; and proposed to bring in a bill for that purpose. The public discontent was also greatly inflamed by some circumstances relating to this bill, which were particularly obnoxious. Lord Beauchamp, in a letter addressed to one of the volunteer corps, was at pains to show that the security of the legislative privileges obtained from the parliament of Britain was insufficient. The lawyers corps also, who took the question into consideration, were of the same opinion; but the circumstance which gave the greatest offence was, that the chief justice in the English court of king's bench gave judgment in an Irish cause directly contrary to a law which had limited all such judgments to the first of June. All these reasons of discontent, however, were removed on the death of the marquis of Rockingham, and the appointment of the new ministry who succeeded him. Lord Temple came over to Ireland, and his brother and secretary Mr Grenville went to England, where he made such representations of the discontents which prevailed concerning the insufficiency of the declaratory act, that Mr Townshend, one of the secretaries of state, moved in the house of commons for leave to bring in a bill to remove from the minds of the people of Ireland all doubts respecting their legislative and judicial privileges. This bill contained, in the fullest and most express terms, a relinquishment on the part of the British legislature of all claims of a right to interfere with the judgment of the Irish courts, or to make laws to bind Ireland in time to come. Thus the contest was at last ended; and ever since this kingdom has continued to flourish, and to enjoy the blessings of tranquillity and peace, free from every kind of restriction either on its commerce or manufactures.

117  
Affairs  
finally settled  
under  
the administration  
of Lord Temple.118  
Climate  
&c. of Ire-  
land.

The climate of Ireland would almost perfectly agree with that of England, were the soil equally improved, being abundantly fruitful both in corn and grats, especially the latter; in consequence of which, an infinite number of black cattle and sheep are bred, particularly in the province of Connaught. Few countries produce finer grain than that which grows in the improved parts of this kingdom. The northern and eastern counties are best cultivated and inclosed, and the most populous.

Ireland is known to have many rich mines; and

there is no inconsiderable prospect of gold and silver in some parts of the kingdom. No country in the world abounds more in beautiful lakes, both fresh and salt water ones; and it is also plentifully watered with many beautiful rivers. The commodities which Ireland exports, as far as her present trade will permit, are hides, tallow, beef, butter, cheese, honey, wax, hemp, metals, and fish: wool and glass were, till December 23, 1779, prohibited; but her linen trade is of late grown of very great consequence. England, in the whole, is thought to gain yearly by Ireland upwards of 1,400,000*l.* and in many other respects she must be of very great advantage to that kingdom. Formerly, indeed, she was rather a burden to her elder sister than any benefit; but the times are changed now, and improve every day.

Mr O'Halloran says, the linen manufacture was carried on in Ireland in very early days to a great extent; and Gratianus Lucius quotes a description of the kingdom, printed at Leyden in 1627; in which the author tells us, "That this country abounds with flax, which is sent ready spun in large quantities to foreign nations. Formerly (says he) they wove great quantities of linen, which was mostly consumed at home, the natives requiring above 30 yards of linen in a shirt or shift." So truly expensive was the Irish fashion of making up shirts, on account of the number of plaits and folds, that, in the reign of Henry VIII. a statute passed, by which they were forbidden, under a severe penalty, to put more than seven yards of linen in a shirt or shift.

We may form some idea of what the trade of Ireland must have been in former times, when, so late as the reign of Brien Boru, who died in 1014, notwithstanding the ravages and distresses which a Danish war, of above 200 years continuance, must have produced throughout the kingdom, the annual duties arising from goods imported into the single port of Limerick, and paid in red wine, amounted to 365 pipes! Even so lately as the last century, it is scarcely credible what riches this city derived from the bare manufacture of shoes, which were exported in amazing quantities; whereas now, instead of shoes and boots, we see the raw hides shipped off for foreign markets.

No country in the world seems better situated for a maritime power than Ireland, where the ports are convenient to every nation in Europe, and the havens safe and commodious. The great plenty of timber, the superior excellence of the oak, and the acknowledged skill of her ancient artizans in wood-works, are circumstances clearly in her favour. That the Irish formerly exported large quantities of timber, is manifest from the churches of Gloucester, Westminster monastery and palace, &c. being covered with Irish oak.

The government of the kingdom is in the hands of a viceroy, or lord-licutenant, who lives in very great splendour. In his absence there are lords-justices (styled their *excellencies*), generally three in number, viz. lord primate, lord high chancellor, and the speaker of the house of commons. The parliament of Ireland meet every other winter, or oftener, according to exigencies.

Ireland is divided into four large provinces, and those again into 32 countries, as follows:

There are 44 charter working-schools at present in Ireland, wherein 2025 boys and girls are maintained

and educated. These schools are maintained by an annual bounty of 1000 l. by a tax upon hawkers and pedlars, and by subscriptions and legacies. The children admitted are those born of Popish parents, or such as would be bred Papists if neglected, and are found of limbs. Their age must be from six to ten; the boys at 16, and the girls at 14, are apprenticed into Protestant families. The first school was opened in 1734. Five pounds are given to every person educated in these schools upon his or her marrying a Protestant. An English act of parliament, lately tolerated the Catholic religion in Ireland, and by that means has relieved thousands of useful subjects.

The return of houses in Ireland for the year 1754, was 395,439; and for the year 1766, it was 424,046. Supposing therefore the numbers to have increased at the same rate, the number of houses now cannot be less than 454,130; which, allowing five persons to a family, will make the number of inhabitants 2,260,650; but as the return of houses by hearth-collectors is rather under than above the truth, and as there are many families in every parish who are by law excused from that tax, and therefore not returned, the number on a moderate estimate will be 2,500,000. Sir W. Petty reckoned 160,000 cabins without a chimney; and if there be an equal number of such houses now, the number of people will be above 3,000,000. Mr Molyneux says, "Ireland has certainly been better inhabited formerly; for on the wild mountains between Ardmaeh and Dundalk, are observable the marks of the plough, as they are also on the mountains of Altmore. The same has been observed in the counties of Londonderry and Donnegal. Mountains that are now covered with bogs have been formerly ploughed; for when you dig five or six feet deep, you discover a proper soil for vegetation, and find it ploughed into ridges and furrows: a plough was found in a very dead bog near Donnegal; and an hedge, with some wattles, standing under a bog that was five or six feet in depth. The stump of a large tree was found in a bog ten feet deep at Cattle-Forbes; the trunk had been burnt, and some of the cinders and ashes still were lying on the stump. Mr Molyneux further says, that on the top of an high mountain, in the north, there were then remaining the streets and other marks of a large town.

Beauty seems to be more diffused in England, among the lower ranks of life, than in Ireland; which may, however, be attributed to the mere modes of living. In England, the meanest cottager is better fed, better lodged, and better dressed, than the most opulent farmers here, who, unaccustomed to what our peasants reckon the comforts of life, know no luxury but in deep potations of aquavita.

From this circumstance, we may account for a fact reported by the officers of the army here. They say, that the young fellows of Ireland, who offer to enlist, are more generally below the given height than in England. There can be no appeal from their testimony; for they were Irish, and the standard is an infallible test. No reason, indeed, can be given why the causes which promote or prevent the growth of other animals, should not have similar effects upon the human species. In England, where there is no stint of provisions, the growth is not checked; but, on the contrary, it is extended to the utmost bound of nature's

Ireland.

ture's original intention : whereas, in Ireland, where food is neither in the same quantity nor of the same quality, the body cannot expand itself, but is dwarfed and stunted in its dimensions. The gentlemen of Ireland are full as tall as those of England ; the difference, then, between them and the commonalty, can only proceed from the difference of food.

The inhabitants, in general, of this kingdom, are very far from what they have too often and unjustly been represented by those of our country who never saw them, a nation of wild Irish. Miserable and oppressed, as by far too many of them are, an Englishman will find as much civility in general, as amongst the same class in his own country ; and, for a small pecuniary consideration, they will exert themselves to please you as much as any people, perhaps, in the king's dominions. Poverty and oppression will naturally make mankind sour, rude, and unsociable, and eradicate, or at least suppress, all the more amiable principles and passions of humanity. But it should seem unfair and ungenerous to judge of, or decide against, the natural disposition of a man reduced by indigence and oppression almost to desperation. Let commerce, agriculture, and arts, but call forth the dormant activity of their genius, and rouse the native spirit of enterprize, which now lies torpid within them ; let liberal laws unfetter their minds, and plenty cheer their tables ; they will soon show themselves deserving to rank with the most respectable societies in Europe.

122  
Account of  
the bogs in  
Ireland.

The bogs wherewith Ireland is in some places overgrown, are not injurious to health, as is commonly imagined ; the watery exhalations from these are neither so abundant nor so noxious as those from marshes, which become prejudicial from the various animal and vegetable substances which are left to putrify as soon as the waters are exhaled by the sun. Bogs are not, as one might suppose from their blackness, masses of putrefaction ; but, on the contrary, they are of such a texture, as to resist putrefaction above any other substance we know of. A shoe, all of one piece of leather, very neatly stitched, was taken out of a bog some years ago, yet entirely fresh ;—from the very fashion of which, there is scarce room to doubt that it had lain there some centuries. Butter, called *rouskin*, hath been found in hollowed trunks of trees, where it had been hid so long, that it was become hard and almost friable, yet not devoid of unctuousity ; that the length of time it had been buried was very great, we learn from the depth of the bog, which was ten feet, that had grown over it. But the common phenomenon of timber-trees dug out of these bogs not only found, but also so embalmed as afterwards to defy the injuries of time, demonstrate the antiseptic quality of them. The horns of the moose deer must have lain many centuries in a bog ; for the Irish histories do not recognize the existence of the animal whereon they grew. Indeed, human bodies have, in many places, been dug up entire, which must have lain there for ages. The growth of bogs, however, is variable in different places, from the variety of conditions in the situation, soil, humidity, and quantity of vegetable food ; in some places it is very rapid, in others very slow ; and therefore their altitudes cannot afford any certain measure of time. In the manufacturing counties of the north, peat-fuel has become so scarce, that

N<sup>o</sup> 169.

turburics let from five to eight guineas an acre. In some places they are so eradicated, there does not remain a trace of them, the ground being now converted into rich meadows and sweet pastures.

If we trust to authorities, we must conclude that Ireland was not originally inferior to England, either in the fertility of the soil or salubrity of the climate. When this country shall have felt the happy effects of the late concessions and indulgencies of the British parliament, by repealing several acts which restrained the trade of this kingdom with foreign ports, and allowing the exportation of woollen manufactures and glass, and shall have received further indulgencies from the same authority ; and when the spirit of industry shall be infused, in consequence of it, into the common people ; their country will not be inferior to any other on the globe under the same parallel. It is very difficult to say, whether foreign or domestic causes have operated most powerfully in laying waste this fruitful country ; which, by being relieved from their late unnatural prohibitions, will be enabled to furnish a grand proportion of supplies to Great Britain, and will unavoidably become of vast importance, by its reciprocal trade, in restraining the increase of that of France, who cannot carry on this important branch of traffic without the assistance of Irish wool. The wool of France is short and coarse, being, in the language of the manufacturers, neither fine in the thread nor long in the staple. This obliges them to have recourse to the wool of Ireland, which possesses both these qualities. Assisted by a pack of Irish wool, the French are enabled to manufacture two of their own ; which they will no longer be enabled to procure, as the Irish will now work up their own wool which they used to export ; great part of which found its way to France, and enabled them to supply other markets, to the great prejudice of Britain. The happy effects of it have been already felt ; for notwithstanding it was so late as December 23, 1789, that the royal assent was given to the taking off their restraints on woollen exports, it appears, that on January 10th following, an export-entry was made at the custom-house of Dublin of 1300 yards of serge for a foreign market, by William Worthington, Esq.

IRENÆUS (St), a bishop of Lyons, was born in Greece about the year 120. He was the disciple of Pappias and St Polycarp, by whom, it is said, he was sent into Gaul in 157. He stopped at Lyons, where he performed the office of a priest ; and in 178 was sent to Rome, where he disputed with Valentinus, and his two disciples Florianus and Blastus. At his return to Lyons, he succeeded Photinus, bishop of that city ; and suffered martyrdom in 201, under the reign of Severus. He wrote many works in Greek, of which there only remains a barbarous Latin version of his five books against heretics, some Greek fragments in different authors, and pope Victor's letter mentioned by Eusebius. The best editions of his works are those of Erasmus, in 1526 ; of Grabe, in 1702 ; and of Father Massuet, in 1710. St Irenæus's style is close, clear, and strong, but plain and simple. Do lwell has composed six curious dissertations on the works of St Irenæus.

He ought not to be confounded with St Irenæus the deacon, who in 275 suffered martyrdom in Tuscany,

**Irene** || **Iris.**  
 under the reign of Aurelian; nor with St Iræneus, bishop of Sirmich, who suffered martyrdom on the 25th of March 304, during the persecution of Dioclesian and Maximianus

**IRENE**, empress of the east, celebrated for her valour, wit, and beauty; but detestable for her cruelty, having sacrificed her own son to the ambition of reigning alone. She died in 803.

**IRENE**, in botany: A genus of the pentandria order, belonging to the dioecia class of plants; and in the natural method ranking under the 54th order, *Miscellanæ*. The male calyx is diphyllous, the corolla pentapetalous; and there are five nectaria. The female calyx is diphyllous, the corolla pentapetalous; there are two sessile stigmata, and a capsule with flocky seeds.

**IRIS**, in physiology, the rainbow. The word is Greek, *ἴρις*, supposed by some to be derived from *ἴριος* "I speak, I tell;" as being a meteor that is supposed to foretel, or rather to declare rain. See RAINBOW.

*Lunar Iris*, or *Moon-rainbow*. See RAINBOW (*Lunar*).

**IRIS**, in anatomy, a striped variegated circle round the pupil of the eye, formed of a duplicature of the uvea. See ANATOMY, p. 767.

**IRIS** is also applied to those changeable colours which sometimes appear in the glasses of telescopes, microscopes, &c. so called from their similitude to a rainbow. The same appellation is also given to that coloured spectrum, which a triangular prismatic glass will project on a wall, when placed at a due angle in the sun-beams.

**IRIS**, the *Flower de Luce*, or Flag-flower, &c. in botany: A genus of the monogynia order, belonging to the triandria class of plants; and in the natural method ranking under the sixth order, *Ensatæ*. The corolla is divided into six parts; the petals alternately reflexed; the stigmata resembling petals

There are 44 species, all herbaceous flowering perennials, both of the fibrous, tuberous, and bulbous rooted kind, producing thick annual stalks from 3 or 4 inches to a yard high, terminated by large hexapetalous flowers, having three of the petals reflexed quite back and three erect; most of which are very ornamental, appearing in May, June, and July.

**Culture.** All the species are easily propagated by offsets from the roots, which should be planted in September, October, or November, though almost any time from September to March will do. They may also be raised from seed, which is the best method for procuring varieties. It is to be sown in autumn, soon after it ripens, in a bed or border of common earth, and raked in. The plants will rise in the spring, and are to be transplanted next autumn.

**Properties.** The roots of the Florentine white iris, when dry, are supposed to have a pectoral virtue. They have an agreeable smell, resembling that of violets; and hence are used in perfumes, and in flavouring of liquors. When recent, they have a bitter, acrid, nauseous taste; and when taken into the body, prove strongly cathartic; on which account they have been recommended in dropsies, in the dose of three or four scruples.—The juice of the species called *bastard acorus*, or *yellow flag-flower*, is also very acrid, and hath been found to produce plentiful evacuations from the

bowels when other means had failed. For this purpose, it may be given in doses of 80 drops every hour or two; but the degree of its acrimony is so uncertain, that it can hardly ever come into general use. The fresh roots have been mixed with the food of swine bitten by a mad dog, and they escaped the disease, when others, bitten by the same dog, died raving mad. Goats eat the leaves when fresh; but cows, horses, and swine, refuse them. Cows will eat them when dry. The roots are used in the island of Jura for dying black.—The roots or bulbs of a species growing at the Cape, are roasted in the ashes and used as food by the natives; they are called *oenkjes*, and have nearly the same taste with potatoes. The Hottentots, with more reflection than generally falls to the share of savages, use the word *oenkjes* in the same sense in which Virgil used that of *ariste*, that is, for reckoning of time; always beginning the new year whenever the *oenkjes* push out of the ground, and marking their age and other events by the number of times in which in a certain period this vegetable has made its appearance.—The Siberians cure the venereal disease by a decoction of the root of the *Iris Sibirica*, which acts by purging and vomiting. They keep the patient eight days in a stov, and place him in a bed of the leaves of the *arctium lappa*, or common burdock, which they frequently change till the cure is effected.

*Iris-Stone*. See *Moon-Stone*.

**IRON**, one of the imperfect metals, but the hardest and most useful as well as the most plentiful of them all, is of a livid whitish colour inclining to grey, and internally composed to appearance of small facets; susceptible of a fine polish, and capable of having its hardness more increased or diminished by certain chemical processes than any other metal.

It is very generally diffused throughout the globe, being frequently found mixed with sand, clay, chalk, and being likewise the colouring matter of a great number of stones and earth. It is found also in the ashes of vegetables, and in the blood of animals, in such abundance, that some authors have attributed both the colours of vegetables and of the vital fluid itself to the iron contained in them. In consequence of this abundance the iron ores are extremely numerous.

1. Native iron, formerly thought not to have an existence any where, is now certainly known to have been met with in several places. It is, however, by no means common, but occurs sometimes in iron mines. Margraaff found a fibrous kind of it at Eibenstock in Saxony, and Dr Pallas found a mass in Siberia weighing 1600 pounds. Mr Adanson likewise informs us, that native iron is common about Senegal; but some naturalists are of opinion that these pieces which have been taken for native iron, are in reality artificial, and have been accidentally buried in the earth. The large piece mentioned by Dr Pallas is of that species called *real sort*, which is malleable when cold, but brittle when red hot.—A mass of a similar nature is said to have been lately found in South America.

This American mass of iron was discovered by some Indians in the district of Santiago del Estero in the midst of a wide extended plain. It projected about a foot above the ground, and almost the whole of its upper surface was visible; and the news of its being found in a country where there are no mountains, nor

**Iris,**  
**Iron.**

Diffused & most all over the globe.

2. Found native in Siberia, Senegal, &c.

*Phil. Trans.* vol. 78.

even the smallest stone within a circumference of 100 leagues, could not but be very surprising. Though the journey was attended with great danger on account of the want of water, and abundance of wild beasts in these deserts, some private persons, in hopes of gain, undertook to visit this mass; and having accomplished their journey, sent a specimen of the metal to Lima and Madrid, where it was found to be very pure soft iron.

As it was reported that this mass was only the extremity of an immense vein of the metal, a commission was given to Don Michael Rubin de Celis to examine the spot; and the following is an abstract of his account.

"The place is called *Otumpa*, in lat. 27. 28. S. and the mass was found almost buried in pure clay and ashes. Externally it had the appearance of very compact iron; but internally was full of cavities, as if the whole had been formerly in a liquid state. I was confirmed in this idea (says our author), by observing, on the surface of it, the impression of human feet and hands of a large size, as well as of the feet of large birds, which are common in this country. Though these impressions seem very perfect, yet I am persuaded that they are either a *lusus nature*, or that impressions of this kind were previously upon the ground, and that the liquid mass of iron falling upon it received them. It resembled nothing so much as a mass of dough; which having been stamped with impressions of hands and feet, and marked with a finger, had afterwards been converted into iron.

"On digging round the mass, the under surface was found covered with a coat of scoriae from four to six inches thick, undoubtedly occasioned by the moisture of the earth, because the upper surface was clean. No appearance of generation was observed in the earth below or round it to a great distance. About two leagues to the eastward is a brackish mineral spring, the only one to be met with in all the country. Here there was a very gentle ascent of between four and six feet in height, running from north to south; all the rest being as perfect a level as can be imagined. The earth in every part about this spring, as well as near the mass, is very light, loose, and greatly resembling ashes even in colour. The grass of the adjacent parts is very short, small, and extremely unpalatable to cattle; but that at a distance is long and extremely grateful to them: from all which circumstances it is probable that this mass was produced by a volcanic explosion. Its weight might be estimated at about 300 quintals.—It is likewise an undoubted fact, that in these forests there exists a mass of pure iron in the shape of a tree with its branches. At a little depth in the earth are found stones of quartz of a beautiful red colour, which the honey-gatherers, the only persons who frequent this country, make use of as flints to light their fires. They had formerly carried some of them away on account of their peculiar beauty, being spotted and fludded as it were with gold. One of these, weighing about an ounce, was ground by the governor of the district, who extracted from it a drachm of gold."

The native iron said to have been found about Senegal has a cubical form; and out of this the black inhabitants make different kinds of vessels for their own use. Some masses have been found in a polyhe-

dral granulated form, and of a bright yellow colour; but which, on being polished, show the proper colour of the metal. Mr Bergman informs us, that the great mass of native metal found in Siberia resembles forged iron in its composition, a centenary, or 63 grains, yielding 49 cubic inches of inflammable air; and from many experiments it appears, that ductile iron yields from 48 to 51 cubic inches of the same kind of air. Dr Matthew Guthrie informs us, that "the pores of this iron were filled with a yellow vitreous matter, of such hardness as to cut glass." The cells are lined with a kind of varnish contiguous to the glassy substance within.

2. The *calceiform ores* are either composed of the Calcior<sup>3</sup> blackish, blackish-brown, or red calx of the metal; the ores, former being in some measure magnetic, in consequence of the phlogiston it contains; the latter showing nothing of this property until it be roasted.

The name of *calceiform* may be applied to all the ores of this metal, excepting the native iron already mentioned, and the native Prussian blues, of which we shall afterwards treat. All of them are mixed with different minerals, and generally take their colour from that of the calx of iron which is prevalent in them. Mr Kirwan enumerates a great many different species.

3. *Steel ore*, *Stachlerz*, the *ferrum chalybeatum* Steel ore<sup>4</sup> *Linnæi*, and *minera ferri nigra* of *Cronstedt*. This is of a dark colour, solid, and compact, but with difficulty striking fire with steel; reducible to a black powder, obedient to the magnet, and somewhat malleable when red hot; affording from 60 to 80 per cent. of good iron. It is met with in Sweden, the Isle of Elbe, and North America. The *ferrum tessulare* and *minera ferri crystallizata* of Wallerius, belongs to this species, but is somewhat less magnetic. Our author denominates it crystallized iron ore in an octohedral or cubic form.

4. The *magnet*, according to Fourcroy, is a muddy Magnet<sup>5</sup> iron ore, which, however, some authors suppose to be very near the metallic state. Mr Kirwan says it differs but little from the foregoing, only that it has less lustre. There are two kinds, the fine and the coarse grained, of which the latter lose their power the soonest. When heated red hot, it smells of sulphur. Our author thinks it may contain nickel, as this semi-metal is found to possess a magnetic property when purified to a certain degree.

5. The brown calx of iron combined with plumbago, *black eisen glimmer*, *selbwartz*, *eisen haben* or *eisenman*, consists of black shining scales more or less magnetic, affording, according to Mr Rinman, 26 per cent. of iron, the rest being plumbago. Brown<sup>7</sup>

6. The brown calx of iron united with the white White<sup>8</sup> calx of manganese, and mild calcareous earth in various ores. proportions. These constitute the white ores of iron, on which Mr Bergman has given a dissertation.—"They have received (says he) divers denominations from the singular heat with which they are accompanied. Their texture is almost the same with that of the calcareous stone, yet it is rarely found compact, and composed of impalpable particles. It is sometimes squamous, sometimes granulated with small distinct particles, some of them shining, but in general spathous. This description, however, is not meant for their complete and perfect state; for the figure of their parts is more or less destroyed by spontaneous calcination;

Iron. tion; nay, the whole mass is at length resolved into a powder: sometimes it is found stalaclitic, siltulous and ramous, cellular, or even germinating like moss. Sometimes, though very seldom, they have sufficient hardness to strike fire with steel; but though, when found mixed with flint and newly dug up, they are of this kind, yet they soon lose the property we speak of. When perfect, they generally resemble the calcareous stone, unless when exposed for some time to the air, by which the union of their parts are gradually diminished. Their colour is white, but the surface which comes into contact with the air grows gradually brown, or even blackish; yet as long as the iron which is converted into an ochre remains in them, they have a ferruginous hue; but though the surface is thus changed, the internal parts remain the same, and, on being filed or broken, exhibit the natural colour. — This change is effected by the air, not upon the iron, as is commonly believed, but on the white calx of manganese which is dephlogisticated by the atmosphere.

“ The specific gravity of the ore, when perfect, varies between 3,640 and 3,810, and is diminished according to the degree of calcination. The ore whose particles are quite separated is from 2.5 to 2.9; but that which is not perfectly corroded, from 3.3 to 3.6. It is rarely attracted by the magnet, whether perfect or calcined, though the metallic part sometimes amounts to nearly one half the weight.

9  
A mountain of iron ore in Dalecarlia in Sweden.

The white ores of iron are found, though in very small quantity, in Sweden. The *Suart-begger*, or *Black Mountain*, in Dalecarlia, has its name from its surface, which is grown black by calcination. It is high, and naked on the summit, which is crossed by a broad calcareous vein with shining particles of spar, and a white ore of iron, together with a galena, pseudogalena, black ore of iron, pyrites, schoerl, and garnet intermixed. In the old mines at Hallefero, or the eastern mines, the rock itself appears to consist of a white ore of iron; but in other places it is either found in small quantity, or very poor in metal. Many mountains about Smialkald in Germany contain these ores. In one called *Stabltegger*, a broad vein occurs almost horizontal, and from 25 to 30 fathoms thick. It consists of an irregular spar, in which are dispersed quartz and pieces of the ore, which are found of a better quality in proportion as they are more deeply seated. The uppermost side, which is pendant, consists of a sandy stone from 9 to 20 fathom high; but the lower is margaceous, and is found more indurated towards the lower parts; and at the very lowest is extended by a blue mica: the sides scarcely cohere to the vein. The whole mountain in Nauffavia consists of a yellowish ore of iron, certain veins of which are accompanied with copper, and others with hæmatites. The hill of *Arzberg*, situated at Eisenartz in Upper Silesia, is 6000 fathoms in circuit, 900 in diameter, and 450 in height. According to some accounts the ore is irregularly accumulated and concreted, consisting of masses of quartz charged with argillaceous earth and white ore of iron; but, according to others, the ore is found there not only in heaps, but in various veins.”

This ore, when analysed, gave 38 parts of the brown calx of iron, 24 of the white calx of manganese, and 50 of mild calcareous earth. Another from West Silvathreg, yielded 22 of the brown calx of iron,

28 of the white calx of manganese, and 50 of mild calcareous earth. The aerial acid is used, and is united not only to the earth, but also to the metallic calx. The above proportions of the crude materials in the ore of Eisenartz, would yield, according to Mr Kirwan, 38 parts of calcareous earth, 35 of iron in its metallic state, and 24 of manganese. Many others are poorer, and some to such a degree as scarcely to deserve the name of an ore. They abound also in France and Spain, and are found sometimes in heaps, sometimes also forming veins, strata, or even whole mountains. Mr Bergman never found them contain any organized bodies; a mark (says he) by which the most ancient productions of the earth have been distinguished. When this iron ore bears a stalaclitic appearance, and is very white, it is called *flus ferri*, and *eyen blank*. An hundred parts of it yield 65 of calcareous earth, and 35 of calx of iron: which, according to Rissan, produce 27 of iron in its metallic state.

7. *Magnetic sand*. Of this kind is the black sand of Virginia, whose specific gravity is about 4,600, and contains half its weight of metal. <sup>10</sup> Black sand of Virginia.

From an account inserted in the Philosophical Transactions for 1763, we are informed, that there are very large quantities of this sand-iron ore in Virginia; perhaps as large as of any other kinds of iron-ore. It is so pure, that it requires a mixture of bog-ore, or of slags from other smeltings, to reduce it to a metallic form. The iron and steel produced from it were above 60 per cent. or from 50 to 85; the quality of both extremely good; and two small bars were sent as a sample to the museum of the Royal Society of London. Large strata of black sand iron-ore are found in Portugal, even at a considerable distance from the seashore, or from any running waters. A very great part of this black sand is attracted by the magnet. There is also found, particularly in France, a black, heavy, unmagnetic sand, of the siliceous kind, which is said to contain iron and zinc in great quantity. Mr Kirwan, p. 143. of his Mineralogy, speaks of a siliceous sand consolidated by semiphlogisticated calx of iron, which does not crumble into sand when powdered. It is generally of a black or brown colour; but grows reddish or yellowish, and moulders by exposure to the air. It does not effervesce with acids, unless it contains testaceous particles, which is frequently the case; it is even frequently covered with shells. He adds, that the agglutinating power of solutions of iron has been shown by a stony concretion of this sort that had been long buried in the sea, and is mentioned in a paper of Mr Edward King in the Philosophical Transactions for 1779. Mr Rinman, however, has found that dephlogisticated calces of iron, and particularly its solutions in mineral acids, have no binding power.

8. Red calx of iron indurated and combined with a small quantity of clay, frequently with manganese. <sup>11</sup> Indurated red ore. Fourcroy calls this a muddy iron-ore, which seems to be formed in the manner of stalaclites, and deriving its name from its colour, which is commonly red, or the colour of blood, though not without variations. Mr Kirwan says, that “ it is generally of a red, yellow, purple, or brown colour, of a metallic lustre, and very hard, though seldom capable of giving fire with steel.” Fourcroy tells us, that it is usually composed of layers which cover each other, and are themselves formed of

Iron.

convergent needles, the external part being covered with tubercles; and that it is not only distinguished by the colour, but by the form, as the hæmatites botrytes, in the form of bunches of grapes. Mr Kirwan tells us, that its structure is either solid, granular, scaly, or fibrous; that it occurs in shapeless masses, in a stalaçtital form; or, according to Gmelin, crystallized in regular forms, though M. de Lisle denies this. In some places it forms whole mountains, and affords from 40 to 80 per cent. of iron. Mr Gerhard extracted alum from it, which affords a proof of its containing clay; and Mr Hilan found it also to contain manganese. In its natural state it is not affected by the magnet; but by torrefaction it becomes black and magnetic.

12  
Ochres of  
different  
kinds

9. Hæmatitical, red, yellow, and brown ochres. These are, by Mr Kirwan, intitled "hæmatites in a loose form, mixed with a notable proportion of argill" (clay.) They are distinguished, he says, from clays, by containing a larger proportion of martial particles. To this species belong the ores which become brown by calcination, and likewise magnetic. They are sometimes mixed with clay or calcareous earths; in which case these ores effervesce with acids. The hæmatites, or blood stones, have their names, not on account of their external colours, but because, when reduced to powder, they produce a red or blood-colour. The yellow hæmatites, however, only produce the same colour by pulverisation. They are productive of very good iron, and are found in great abundance in the province of Galiza in Spain. The inhabitants of Compostella, the capital, make a good commerce of these hæmatites of the hardest kind for the burnishing gold leaves, and various other metals. A dark blue kind, somewhat similar to black-lead, is principally employed for these purposes. They are found in many parts of Europe, sometimes forming whole mountains. The most extraordinary ores of this kind, both on account of their forms and of their various and brilliant colours, are found in the island of Elba near the coast of Tuscany. The crystallized ores are here the most beautiful and the most common, though not to be met with any where else. They exhibit various gradations of the finest colours, as red, violet, blue, green, yellow, brown, and black; inasmuch that, according to Coudrai's expression, they look like so many clusters of emeralds, sapphires, diamonds, rubies, and topazes. E. Peni and Mongez affirm, that these ores are mineralized only by the aerial acid; tho' Coudrai is of opinion, that they contain sulphur also. Besides these beautiful crystallized ores, this island contains also many others; being indeed little other than a group of iron-mountains. The ores in general produce the very best kind of iron.

13  
Emery.

10. *Emery, Smyris*, is a grey or reddish iron-ore found in great quantity on the islands of Jersey and Guernsey. It is extremely hard, yielding in this respect to no substance except the diamond itself. It is also very refractory, and for these reasons is not used for the sake of the metal it contains, nor indeed is it well known what proportion is contained in it. "The best sort (says Mr Kirwan) is of a dark grey colour, but becomes brown, and in great measure magnetic, by calcination: other sorts are of a rusty reddish white or yellowish colour. Its specific gravity is from 3.000 to

4.000. It is used in polishing glass and metals; for which purpose it must first be ground down and levigated in mills.

Iron.

14  
Bog ores,  
&c.

11. The *argillaceous ores*. These comprehend the ochres, and more particularly those mentioned by Fourcroy under the name of *bog-ores* of iron, which are commonly met with disposed in beds, and seemingly deposited by waters. Mr Fourcroy informs us, that this kind of ore is very often in the form of spherical bodies either regular or irregular. Organic matters, such as wood, leaves, bark, shells, &c. are not frequently found in the state of bog-ores. This kind of transition seems to indicate an analogy betwixt iron and organic substances. In the wood of Boulogne near Auteuil there is a mine of bog-ore of iron, in which vegetable substances become mineralized almost immediately under our eyes.

Mr Kirwan distinguishes two principal varieties of these; one found on mountains, and such as are met with in swampy grounds or low lands overflowed with water; both of them very heavy, and some absorbing water like clays.

15  
Highland  
argillaceous  
ores.

The Highland argillaceous ochres are either yellow, red, brown, or greyish, indurated and friable, or loose and powdery, or in grains; they are composed chiefly of the red or yellow calx of iron, or of a grey iron ore called *Torsien*, in a loose form mixed with clay. Hence they often contain manganese or siderite, and in France are said to be mixed with a calx of zinc. They do not obey the magnet before calcination, and rarely after it. They effervesce with acids only in consequence of being mixed with calcareous earths; they are soluble with difficulty in the acids, but the most soluble are the best. The iron produced from them is of very different quality, according to the nature of the ore from whence it is produced. To this species belong the hornstone overloaded with iron, and a white iron ore mentioned by Rinman found in Kent. It is mixed with clay or marl, and is scarcely soluble in acids. It affords 47 per cent. of brittle iron.

16  
Swampy  
ores.

The swampy argillaceous ore, according to Mr Kirwan, are found in irregular lumps of a brown or brownish-black, and sometimes in round balls, porous or solid, or in flat round pieces or in grains, and sometimes in slender triangular prisms parallel to each other, and very brittle. It is mixed with clay and extractive, and becomes magnetic by calcination; during which operation it gives out a quantity of aerated volatile alkali, and loses one-fourth of its weight. The crude ore affords about 36 per cent. of metal, and 50 per cent. after calcination. The iron produced from it, at least in Sweden, is that called *coldshort*. According to Mr Hialm some sorts of this ore contain 28 per cent. of manganese.

17  
Red calca-  
reous ore.

12. *Red calcareous iron ore* is found loose in many parts of England, effervesces strongly with acids, and is used as a paint under the name of red ochre.

18  
Martial ca-  
lamine.

13. *Martial calamine*. Though calamine is properly an ore of zinc, it sometimes contains such a large proportion of iron as to make it worth while to extract the iron. The ore consists of a mixture of quartz and clay, with the calces of iron and zinc. It is of a moderate hardness, and a yellow, red, or brown colour.

19  
Martial.

14. *Martial pyrites*. This has its name from its property of giving fire with steel. It is commonly in

small red masses, sometimes regularly formed, and usually cubical, spherical, or dodecahedral, though their form varies considerably. Some are brown on the outside, others of the colour of iron, some yellowish, and resembling the ores of copper, even on their surface; but all of them are yellow, and as it were coppery within, and for the most part composed of needles, or pyramids of several sides, whose summits converge to a common centre. The pyrites are commonly dispersed, and particularly in copper mines in the neighbourhood of iron mines, and in clays and coal mines, the upper stratum of the latter being almost always pyritous. They are all easily decomposed, and yield green vitriol, as is explained under the article CHEMISTRY.

15. *Iron mineralized by arsenic.* This combination takes place either by the combination of arsenic alone with the metal, or in conjunction with sulphur. The former is called in Germany *mispickel*, and *speiss* by the Bohemians; is of a bright white colour, sometimes, though rarely, variegated like a pigeon's neck, and is not easily altered by exposure to the air. It is not magnetic either before or after calcination; it is soluble in acids, and affords arsenic by distillation in the proportion of 30 or 40 *per cent.* and sometimes contains a small proportion of copper and silver. It is frequently found in indurated clay, quartz, spar, schoerl, &c. and mixed with other metallic ores. When this metal contains less than  $\frac{1}{10}$ th of arsenic, it is magnetic, according to Scheffer; whence, if the calcination be pushed to a sufficient length, the ore must remain magnetic.

That species of ore which consists of iron mineralized by sulphur and arsenic together, contains the white, grey or bluish grey pyrites or marcasite. It is found either in solid compact masses of a moderate size, or in grains, and gives fire with steel. When burnt it affords a blue flame and the smell of arsenic, with orpiment or realgar, instead of pure arsenic by distillation in close vessels. It is not magnetic either before or after calcination, and contains much more arsenic than sulphur.

16. *Native Prussian blue* consists of clay mixed with iron, and coloured with some unknown tinged substance, generally found in swampy grounds or bogs. It is at first white, but when exposed to the air becomes either of a light or deep blue. By heat it turns greenish, and emits a slight flame, becoming afterward red and magnetic. It is soluble both in alkalies and acids; but the alkaline solution is precipitated by acids, and the acid solution by alkalies. The precipitate at first is greenish, and gradually assumes a white hue, but regains its blue colour on being mixed with vegetable astragants. Mr Woulfe found this kind of ore in Scotland on the surface of the earth. The greatest part of marshy grounds containing turf, likewise have some of this.

17. The *terre verte*, or green earth of Verona and Normandy, is used as a pigment, and contains iron in some unknown state, mixed with clay, and sometimes with chalk and pyrites; alum and selenite being likewise accidentally mixed with it. It is soluble with difficulty in acids, is not magnetic before calcination, and becomes of a coffee-colour by heat.

18. Mr Fourcroy informs us, that "it has been discovered some years ago, that iron is often united na-

turally with the phosphoric acid. The muddy or bog ores are sometimes of this nature: a portion of this compound remaining in the iron gives it the property of being brittle when cold. Iron in this state was called *siderite* by Bergman, and it has since been called *water-iron*.

There are several other kinds of iron ore enumerated by mineralogists; but those already mentioned are the most remarkable.

The following observations on iron in its different states, with an account of the methods of manufacturing it, &c. are extracted from Magellan's Notes on Cronstedt's Mineralogy.

1. Iron is employed in three different states, each having its peculiar properties, by which they are each more particularly applicable to various purposes. The first is *cast iron*, the second is *wrought or malleable iron*, and the third is called *steel*.

According to Bergman, cast iron, which may be called *unripe* or *raw-iron*, contains the smallest share of phlogiston. The malleable iron contains the greatest quantity; and the steel a middling share between both, neither so much as the malleable, nor so little as the cast-iron. This last is called also *pig-iron*, and *ycelin* in England.

2. The richest ores of iron are the compact and ponderous, of a brownish, reddish-brown, or red colour. Some of these ores, in colour and appearance, do not ill resemble iron itself; as the grey ores of Derbyshire, and the bluish of the Forest of Dean in Gloucestershire. Most of the Swedish ores are likewise of this kind. Others are blackish, brown, red, yellowish, or rusty-coloured: these are the most common in England and Germany. There is one very singular species of a striated texture, and of a pale yellowish or greyish colour, oftentimes white, and in some degree pellucid; which, although in its crude state, promises nothing metallic, nevertheless, on being moderately calcined, discovers, by the deep colour it assumes, that it abounds in iron. Cramer informs us, that it gives out by fusion from 30 to 60 *per cent.* But some richer ores yield no less than 70 and 80 on the hundred.

3. Different kinds of iron ore are found adhering in some mines to the tops of caverns in form of icicles or striae, sometimes irregularly clustered together, sometimes hanging down like the bristles of a brush; from whence the name of *brush-iron-ore*. Other particular forms of the iron stone have occasioned a variety of fanciful names, that are met with in some of the metallurgic writers.

4. The iron of Great Britain is made from three different kinds of ores: 1. From the iron-ore called the *Lancashire ore*, from the country where it is found in greatest abundance. This ore is very heavy, of a fibrous or lamellated texture; it is of a dark purple, approaching to a shining black; and when reduced to powder, it becomes of a deep red: it lies in veins like the ores of other metals. 2. The bog-ore, which resembles a deep yellow ochry clay, and seems to be the deposition of some ferruginaceous rivulets, whose currents had formerly been over the surface of those flat marshy plains. It lies in beds of irregular thickness, commonly from 12 to 20 inches, and very various in their breadths from side to side, never being of great dimensions. 3. The iron-stones, however, have no regular

Iron. gular appearance, and do not in the least resemble a metal in their external surface. They lie often in beds of great extent, like other stony matters, and are sometimes stratified with seams of pit coal, forming alternate layers.

5. The ores of iron are commonly calcined previous to the fusion, even the harder ones, though they should contain nothing sulphureous or arsenical, in order to calcine the hard adhering matrices, and render the masses soft enough to be easily broken into fragments of a convenient size for melting. After the mineral is duly prepared, it must be smelted in furnaces of large capacities, from 16 to 25 feet high, and from 10 to 14 wide: the most approved shape nearly resembles that of a hen's egg, with the largest end undermost, below which is a square cavity to contain the melted metal, and at the top a very short vent about 20 inches in diameter. The inner wall is built of fire-stone, which endures very strong heat with little risk of melting, and all the joints are cemented with mortar composed of sand and clay. This is surrounded with more building, which deviates more and more from a circular form, and becomes a square building of about 20 feet at the base, and gradually converges to the top.

6. Near the bottom is an aperture, for the insertion of the pipe of a large bellows, worked by water or by other machines that may produce a strong current of air. Some very powerful ones, as those in the iron works at Colebrook-dale and at Carron, consist of two or more iron cylinders, about upwards of two feet wide, whose pistons are alternately moved by a small fire engine or by a water wheel: but Mr Wilkinson very ingeniously adapted to his own a large vaulted receiver surrounded by water, which produces a very regular and uniform blast. Two or more holes are also left ready to be occasionally opened at the bottom of the furnace, to permit at a proper time the scoria and the metal to flow out, as the process may require. Charcoal, or coke with lighted brushwood, is first thrown in: and when the inside of the furnace has acquired a strong ignition, the ore is thrown in by small quantities at a time, with more of the fuel; and commonly a portion of lime-stone is thrown also as a flux. The ore gradually subsides into the hottest part of the furnace, where it becomes fused; and the metallic parts being revived by the coal, pass through the scoria, and fall to the lower part or bottom of the furnace, where a passage is open for taking off the scum or dross. The metal now in strong fusion is let out by a tap-hole into furrows made in a bed of sand: the large mass, which sets in the main furrow, is called by the workmen a *row*, and the lesser ones *figs* of iron. Chimney-backs, stoves, garden-rollers, &c. are formed of this rough metal, taken out of the receiver with ladles, and cast into moulds made of fine sand."

It is proper to observe, that the excessive and long-continued ignition kept up in these furnaces gradually wastes the materials of which they are composed, rendering their sides thinner until at last they become unable to sustain the weight of the melted metal; so that it has sometimes been known to burst out suddenly in a violent and most destructive stream. At certain intervals, therefore, the fire ought to be allowed to go

out, whatever may be the expence of rekindling it, and the furnace examined and repaired.

7. The quantity, of fuel, the additions, and the heat, must be regulated, in order to obtain iron of good quality; and this quality must likewise in the first product be necessarily different, according to the nature of the parts that compose the ore.

8. Two or three tons, viz. 4000 or 6000 pounds weight of iron, are now run off in 24 hours, at some large furnaces, after the application of the large bellows; whilst scarcely an hundred weight could be obtained in a day before that application, because a large quantity of the metal was left in the dross; hence in some places the slags of different ores, left by old operators in former times, are now remelted to advantage along with fresh ore; and on account of the richness of these old slags of different ores, some people have been misled into the opinion, that the metal was regenerated in them.

9. Peat and turf has been found to answer tolerably well, mixed with charcoal, for the smelting of iron ores; but an attempt to use it on a large scale has at last been found not to answer the expectations that had been conceived from the first trials. Pit-coal, if applied to the same purpose, renders the iron hard and brittle; but this inconvenience is prevented, by previously coaking the coal, and employing it in the state of true coak. Cramer, in his Art of Assaying, p. 347. says, that pit-coals, kennel-coals, and Scotch-coals, which burn to a white ash like wood, and abound more in bitumen, may be used in the first fluxion of the iron from its ore; and if the iron proves not so malleable as required, this property may be given to it by melting the metal a second time with wood.

10. The best cast-iron or raw-iron, as much freed from heterogeneous matters as the usual process of smelting can effect it, is not at all malleable, and so hard as perfectly to withstand the file.

11. In general the impure cast-iron, as run from the ore, is melted down a second time in another furnace, intermixed with charcoal. A strong blast of air being impelled on the surface of the metal, its fusion is remarkably promoted; the iron thickens into a mass called a *loop*, which is conveyed under a large hammer raised by the motion of a water-wheel. The iron is there beaten into a thick square form, is then heated again until almost ready to melt, and is forged; by a few repetitions of this process, it becomes completely malleable, and is at length formed into bars for sale.

12. Iron in this state of malleability is much softer than before, and of a fibrous texture. But if it is still crude and brittle after the above process, it shows that there have remained heterogeneous matters, being hidden in its interstices, which must be expelled; for this purpose the iron must be stratified with charcoal-dust within a proper furnace, heaped up in good quantity in strata; then the fire must be blown pretty strongly, so as to bring it to a fusion, which is to be helped by the addition of fusible scorias or of sand. The fire must not be much greater than necessary to make all these melt as equally as possible; to obtain this end, the melted mass must be agitated here and there with poking rods of wrought iron, in order to make every

iron. part feel alike the action of the fire and air; and the increasing scorias taken out once or twice.

13. In the mean time, a great many sparkles will be thrown out from the iron, which diminish the more as the iron comes nearer to the desired degree of purity, but they never cease entirely. The burning coals being then removed, and the scoria conveyed out of the fire through a channel made for that purpose, the iron, by lessening the violence of the fire, grows solid, and must be taken out red-hot, and tried by striking it with a hammer. If it proves crude still, let the melting be repeated; and when it is at last sufficiently purified, it is to be hammered, and extended various ways, by making it red-hot many times over; this done, it will no longer be brittle, even when cold, as Cramer asserts.

14. Cast-iron has of late been brought into the malleable state by passing it through rollers instead of forging it. Indeed this seems to be a real improvement in the process, as well in point of dispatch, as in its not requiring that skill and dexterity which forgersmen only acquire by long practice. If the purposes of commerce should require more iron to be made, it will be easy to fabricate and erect rolling machines, though it might be impracticable to procure expert forgersmen in a short time.

13. This method was discovered by Henry Cort of Gosport, who obtained an exclusive privilege granted by the king's patent. By this process the raw or cast-iron is freed from the impurities, which are not discharged in the common methods of rendering this metal malleable; for iron is in itself a simple homogeneous metal; and all iron must become equally good, if it be purified from the heterogeneous and unmetallic particles that are any ways mixed with it.

16. The ordinary method of converting cast-iron into malleable, is, as we have seen, by employing great quantities of charcoal, which furnishes phlogiston, and remetalizes the particles, which are unmetallized and mixed with the heterogeneous matters contained in the fused mass: but in Cort's method there is no need of charcoal, instead of which only sea-coal is employed; because the object is not to remetalize, but only to expel what is unmetallic, instead of endeavouring to restore the calcined parts with charcoal at a great expence, and still leaving the business undone. In this method the iron is only heated and wrought simply by the heat of the flame, instead of being mixed with the burning fuel and ashes, which are not easily disengaged afterwards from the metal. The squeezing it between the rollers, forces out the melted slags from the metallic pores, and brings its metallic fibres into a perfect solidity and close contact, so that they are obliged to cohere much more perfectly to each other, than by the interrupted and partial action of the hammer. By the operation of being long stirred, the sulphureous particles are more disposed to be disengaged, and are burned away in the form of blue sparks; the metal then begins to curdle, and to lose its fusibility, like solder when it just begins to settle; the metallic particles meeting and coalescing together, much like the churning of milk, where the cream is separated by the union formed between the fibrous particles of the cheese. The curdles formed into a connected mass

become what is called *loops*. The process is as follows:

17. Five or six hundred weight of raw cast-iron (and even of cold short iron) is brought into a low fusion, on a kind of hearth or low furnace, in which it lies to the depth of about 6 inches. One or two workmen continually stir this fused mass with long iron pokers for about 4 or 5 hours. The heat is then lowered: the men fashion the iron into narrow pieces of about  $3\frac{1}{2}$  feet long, and 3 inches square, with long knives or chisels made for that purpose. They are then heated to the welding degree, and hammered to expel and scatter the unmetallic dross. These slabs are then formed to a wedge-point at one end, in order to adapt them to be received between the rollers: they are malleable already, but they contain still some dross.

18. They are then heated again to the hottest welding heat in the air furnace: and immediately passed through large iron-rollers, turned by a water-wheel or by horses. If the end presented to the rollers should slip instead of entering, a boy, who stands ready, throws some sand upon the iron, and it goes in easily. Much foreign and heterogeneous matter is squeezed out by the rollers; and the iron comes out in a pure malleable state. The same heat will serve to pass the iron through two sets of rollers, which are grooved so as to fashion it into nail-rods or other forms according to the required purposes.

19. Various and repeated severe trials have been made in the royal dock-yards of England, in the presence of persons of knowledge and rank, to prove the strength, malleability, and softness or toughness of this new iron; and it has proved to be equal, and even sometimes superior, to the best Swedish iron. But it is not easy to conceive by what singular fatality so great an improvement in manufacturing this most useful metal has not yet been generally adopted by the iron-masters.

20. Steel is iron in an intermediate state between cast iron and malleable iron, which is soft and tough. The iron run from some German ores is found to be a good steel when forged only to a certain point.

But the best steel is usually made by cementation from the best forged iron, with matters chiefly of the inflammable kind. Two parts of pounded charcoal and one of wood ashes is esteemed a good cement. The charcoal dust may be made of bones, horns, leather, and hairs of animals, or of any of these ingredients after they are burned in a close vessel till they are black: these being pulverized, and mixed with wood-ashes, must be well mixed together. The iron should be of pure metal, not over thick, and quite free from heterogeneous matters: their flexibility, both when hot and when cold, is a very good sign thereof. A deep crucible, two or three inches higher than the bars, is to receive part of the cement, well pressed at the bottom, the height of  $1\frac{1}{2}$  inch; and the bars are to be placed perpendicularly, about one inch distant from the sides of the vessel and from each other. All the interstices are to be filled with the same cement, and the whole covered to the top with it; then a tile is applied to cover the vessel, stopping the joints with thin lute.

Iron.

21. The crucible is then to be put in the furnace, and a strong fire is to be made, that it be kept moderately red hot for six or ten hours together; at the end of which time they will be found converted into steel. If the cementation be continued too long, the steel will become excessively brittle, incapable of being welded, and apt to crack and fly in forging. On the contrary, steel cemented with absorbent earths is reduced to the state of forged iron.

22. Steel is further purified for making the nicest kinds of instruments, such as lancets, pen-knives, razors, and various pieces, for the best kind of watches, time-keepers, or chronometers, and astronomical regulators. This purification of steel consists in melting it again with a strong but regular fire in a crucible, the better to free it from the heterogeneous parts, and little flaws that may be contained in it. It is then called *cast-steel* when fused into bars: which name, however, does not imply that the pieces, for instance the cast-steel razors, have been really cast in their present shape; for they must be forged from the bar after it is cast. The fusion must have been perfect, so that the metallic parts be rendered uniform. The metal diminishes a little by this process, for a bar of common steel 36 inches long, will afterwards produce another only of 35, if properly fused and purified.

23. The cast-steel will not bear more than a red heat; otherwise it runs away, like sand under the hammer, if the heat is pushed to the welding degree. Dr Watson says, that this manufacture of cast-steel was introduced at Sheffield only about 40 years ago by one Waller. This man was still living about the year 1765; he dwelt at St Bartholomew's close, and was a galloon-wire drawer by trade. The difficulty of procuring small cylinders of good steel to flatten the wire for lace-work in his business, whose defect proceeded from the bad texture of the steel, set his imagination on the enquiry after a method of purifying the metal to a greater perfection: and he thought that a new fusion of it was the most likely to accomplish his views. After some trials, he at last succeeded; but it was soon known to others, who got the advantages for themselves; of which ill fate the real inventor very bitterly complained till the end of his life. His own name was even forgotten, as one Huntsman practised this art to such an extent, that cast steel was known under his sole name afterwards.

24. But before this discovery made by Waller in England, this kind of steel was made already in Germany, as Watson asserts; and from thence some small quantities were brought to England at a considerable price. Since that time this branch of business is carried on advantageously at Sheffield; for the manufactures there furnish a great abundance of broken tools and old bits of steel, at a penny a pound, which, after fusion and purification, sell for 10 or 12 times as much.

25. It is a valuable property of iron, after it is reduced into the state of steel, that though it is sufficiently soft when hot, or when gradually cooled, to be formed without difficulty into various tools and utensils; yet it may be afterwards rendered more or less hard, even to an extreme degree, by simply plunging it, when red-hot, into cold water. This is called *tempering*. The hardness produced is greater in proportion as the

N° 169.

steel is hotter and the water colder. Hence arises the superiority of this metal for making mechanic instruments or tools, by which all other metals, and even itself, are filed, drilled, and cut. The various degrees of hardness given to iron, depend on the quantity of ignition it possesses at the moment of being tempered, which is manifested by the succession of colours, exhibited on the surface of the metal, in the progress of its receiving the increasing heat. They are the yellowish-white, yellow, gold-colour, purple, violet, and deep-blue; after which, the complete ignition takes place. They proceed from a kind of scorification on the surface of the heated metal.

26. A bar of clean white steel may be made to assume all the above colours at once, by placing one end in the fire, and keeping the other end out, which is supposed of a proper length to remain cold.

27. These colours serve as signs to direct the artist in tempering this metal. For though ignited steel, suddenly quenched in very cold water, proves excessively hard and brittle; yet it may be reduced to the required degree of temper by heating it till it exhibits a known colour. This is the method employed in this process by the artists. As soon as the piece of steel is completely ignited, they plunge it in a very cold water; and as soon as it loses its fiery appearance, they take it out, rub it quickly with a file, or on a plate covered with sand, that it may have a white surface. The heat, which is still within the metal, soon begins to produce the succession of colours. If a hard temper is desired, as soon as the yellow tinge appears, the piece is dipped again, and stirred about in the cold water. If the purple appears before the dipping it, the temper will be fit for tools employed in working upon metals; if dipped while blue, it will be proper for springs, and for other instruments fit to cut all sorts of soft substances; but if the last pale colour be waited for, the steel will not be hard at all.

28. It deserves notice, that a piece of iron is rendered considerably warm by hammering, so as even to become red hot. But after the iron has been completely hammered once, it is asserted that it cannot be rendered again red hot by the same operation, because no further compression can then be made. Hard steel is the only metal that, being struck slantwise with the sharp edge of a flint, or of another hard stone, produces sparks of fire.

29. Iron is often manufactured so as to be 150 times, and even above 630 times, more valuable than gold. On weighing some common watch pendulum-springs at Mr Tho Wright's, watch-maker to the king, such as are sold at half a crown by the London artists for common work, ten of them weighed but one single grain. Hence one pound avoirdupois (= 7000 gr.) contains ten times as many of these springs; which, at half a crown a-piece, amount to 8750 l. Sterling. The troy ounce of gold sells at 4 l. Sterling, and the pound (= 5760 gr.) at 48 l. Sterling, which gives 58,33 (or 58 l. 6 s. 7 d.) for each pound avoirdupois of gold: and of course  $\frac{8750}{58.33} = 150$ . But the pendulum-springs of the best kind of watches sell at half a guinea each; and at this rate the above-mentioned value must be increased in the ratio of 1. to 4.2; viz. of half a crown to half a guinea: which will amount to 36,750 l. Sterling; and this sum divided by

**Iron.** by the value of this pound of gold, gives above 630 to the quotient.

Under the article **ELECTRICITY**, we have taken notice of a curious experiment of burning iron in dephlogisticated air; of which an account is also given under **AFROLOGY**, where the experiments of Dr Priestley are related. In the last number of the *Chemical Annals* we find the subject particularly treated of by M. Lavoisier. "The beautiful experiment of Mr Ingenhousz (says he) is now well known. A piece of very fine iron wire is turned into a spiral form; one end of it is fixed in a bottle cork; to the other a piece of agaric is fastened: when this has been done, a bottle is filled with vital air; the agaric is lighted, and it is then, along with the iron wire, quickly introduced into the bottle, which is stopp'd with the cork. As soon as the agaric is plunged into the vital air, it begins to burn with a dazzling light: the inflammation is communicated to the iron, which also burns, throwing off bright sparks that fall to the bottom of the bottle in round globules. These globules become black as they cool, and preserve some remains of their metallic lustre. The iron thus burnt is more brittle than glass itself; it powders easily; is attractable by the magnet, but less so than before the operation."

M. Lavoisier, in order to observe more fully the changes which happened to the metal on this occasion, repeated the experiment upon a scale considerably larger. He immersed chips of iron turned into a spiral form into a vessel filled with pure air which contained about 12 quarts; fixing to the end of each chip a small bit of agaric, and a particle of phosphorus weighing scarce  $\frac{1}{10}$ th of a grain. Having set fire to the phosphorus and agaric, the iron is wholly consumed to the very last particle with a bright white light resembling stars in rockets. The heat in this combustion melts the iron, which falls down in globules of different sizes. In the first instant of the combustion there is a slight dilatation of the air; but this is succeeded by a very rapid diminution; and when the quantity of iron is sufficient, and the air very pure, almost the whole gas is absorbed. Our author recommends only small quantities of iron to be burnt at a time; because the heat produced by its combustion is so great, that the glass is apt to fly. A dram, or a dram and an half, is sufficient for a jar holding four gallons, which ought to be very strong in order to resist the weight of the mercury with which it is to be filled. The increase of weight in the iron, by being burnt in this manner, is, according to our author, about 35 per cent. It is then in a state of ethiops, and may be powdered in a mortar. When the air in which the combustion has been performed is very pure, there is no great difference betwixt that in which the iron has been burnt and the original quantity, excepting only a small mixture of fixed air from the little portion of charcoal contained in the iron.

In this work also we find some observations on the solubility of iron in pure water from Crell's *Annals* for the year 1788. It has generally been supposed that pure water is incapable of dissolving or holding iron in solution; but the fact seems now to be established by the following experiment. A pound of fresh distilled water was poured upon two ounces of iron-silings into a narrow-necked glass retort; the vessel was then put

in a sand heat, and the liquid evaporated to one half; after which the mouth was slightly stopp'd with a cork, and the matter left to digest in a gentle heat. On opening the vessel it was found that the water had become styptic, and had a ferruginous taste; whence it appeared that part of the metal was dissolved. Phlogisticated alkali had no effect upon this solution until a few drops of pure distilled acetic acid were added, when a little Prussian blue fell to the bottom. Soon after making this experiment, our author met with a natural mineral water which contained iron in solution, though it would not precipitate any thing until a few drops of acid were added. This solubility of iron in pure water has been also taken notice of by M. Landriani and M. Monnet.

Iron is easily calcinable by fire, and is soluble in all the acids, even that of fixed air. By exposure to the atmosphere it is attacked by the pure part of the surrounding fluid, which thus becomes converted into fixed air, the metal in the mean time being changed into a yellowish brown powder called *rust*. Common iron is much more subject to rust than steel; and this facility of calcination renders it a matter of great importance to discover some effectual method of preventing it from taking place. Various compositions have been recommended, but none have been found more effectual than common oil. As the use of this, however, must be on many occasions troublesome and disagreeable, a still more commodious method has been fallen upon. It is known that the metal, after having undergone that kind of calcination in which it combines with the base of dephlogisticated air, or begins to combine with it, is not subject to rust. By giving it a coating of this kind, therefore, it is effectually preserved from any action of the air; and this is done by heating it till it assumes a blue colour, which indicates a partial calcination on the outside: and thus utensils are made capable of being preserved from rust for a long time; though even these, when exposed wet, or even a long time to the atmosphere, will be covered with rust and decay like others. For the chemical properties of iron, see **CHEMISTRY**; for its electrical and magnetical ones, see **ELECTRICITY** and **MAGNETISM**.

**Iron-Moulds**, and spots of ink in linen, may be taken out by dipping the stained part in water, sprinkling it with a little of the powdered essential salt of wood-fossil, then rubbing on a pewter plate, and washing the spot out with warm water.

**Iron-Sick**, in the sea-language, is said of a ship or boat, when her bolts or nails are so eaten with rust, and so worn away, that they occasion hollows in the planks, whereby the vessel is rendered leaky.

**Iron-Wood**, in botany. See the article **SIDERORHIZUM**.

**Iron-Work**, in botany. See the article **SIDERITIS**.

**IRONY**, in rhetoric, is when a person speaks contrary to his thoughts, in order to add force to his discourse; whence Quintilian calls it *diversifloquium*.

Thus, when a notorious villain is scornfully complimented with the titles of a very honest and excellent person; the character of the person commended, the air of contempt that appears in the speaker, and the exorbitancy of the commendations, sufficiently discover the dissimulation of irony.

Ironical exhortation is a very agreeable kind of trope; which,

**Iroquois** which, after having set the inconveniences of a thing in the clearest light, concludes with a feigned encouragement to pursue it. Such is that of Horace, when, having beautifully described the noise and tumults of Rome, he adds ironically,

"Go now, and study tuneful verse at Rome!"

**IROQUOIS**, the name of five nations in North America, in alliance with the British colonies. They are bounded by Canada on the north, by the British plantations of New York and Pennsylvania on the east and south, and by the lake Ontario on the west.

**IRRADIATION**, the act of emitting subtle effluvia, like the rays of the sun, every way. See **EFFLUVIA**.

**IRREGULAR**, something that deviates from the common forms or rules: thus, we say an irregular fortification, an irregular building, an irregular figure, &c.

**IRREGULAR**, in grammar, such inflections of words as vary from the general rules; thus we say, irregular nouns, irregular verbs, &c.

The distinction of irregular nouns, according to Mr Ruddiman, is into three kinds, viz. variable, defective, and abundant; and that of irregular verbs into anomalous, defective, and abundant.

**IRRITABILITY**, in anatomy and medicine, a term first invented by Glisson, and adopted by Dr Haller to denote an essential property of all animal bodies; and which, he says, exists independently of and in contradistinction to sensibility. This ingenious author calls that part of the human body *irritable*, which becomes shorter upon being touched; *very irritable*, if it contracts upon a slight touch; and the contrary, if by a violent touch it contracts but little. He calls that a sensible part of the human body, which upon being touched transmits the impression of it to the soul; and in brutes, he calls those parts sensible, the irritation of which occasions evident signs of pain and disquiet in the animal. On the contrary, he calls that insensible, which being burnt, tore, pricked, or cut till it is quite destroyed, occasions no sign of pain nor convulsion, nor any sort of change in the situation of the body. From the result of many cruel experiments he concludes, that the epidermis is insensible; that the skin is sensible in a greater degree than any other part of the body; that the fat and cellular membrane are insensible; and the muscular flesh sensible, the sensibility of which he ascribes rather to the nerves than to the flesh itself. The tendons, he says, having no nerves distributed to them, are insensible. The ligaments and capsulæ of the articulations are also concluded to be insensible; whence Dr Haller infers, that the sharp pains of the gout are not seated in the capsulæ of the joint, but in the skin, and in the nerves which creep upon its external surface. The bones are all insensible, says Dr Haller, except the teeth; and likewise the marrow. Under his experiments the pericranium and pericranium, the dura and pia mater, appeared insensible; and he infers, that the sensibility of the nerves is owing to the medulla, and not to the membranes. The arteries and veins are held susceptible of little or no sensation, except the carotid, the lingual, temporal, pharyngeal, labial, thyroidal, and the aorta near the heart; the sensibility of which is ascribed to the nerves that accompany them. Sensibility is allowed to the internal membranes of the stomach, intestines, bladder, ureters, vagina, and womb, on account of

their being of the same nature with the skin: the heart is also admitted to be sensible: but the lungs, liver, spleen, and kidneys, are possessed of a very imperfect, if any, sensation. The glands, having few nerves, are endowed with only an obtuse sensation. Some sensibility is allowed to the tunica choroidis and the iris, tho' in a less degree than the retina; but none to the cornea. Dr Haller concludes, in general, that the nerves alone are sensible of themselves; and that, in proportion to the number of nerves apparently distributed to particular parts, such parts possess a greater or less degree of sensibility.

Irritability, he says, is so different from sensibility, that the most irritable parts are not at all sensible, and *vice versa*. He alleges facts to prove this position, and also to demonstrate, that irritability does not depend upon the nerves, which are not irritable, but upon the original formation of the parts which are susceptible of it. Irritability, he says, is not proportioned to sensibility; in proof of which, he observes, that the intestines, though rather less sensible than the stomach, are more irritable; and that the heart is very irritable, though it has but a small degree of sensation.

Irritability, according to Dr Haller, is the distinguishing characteristic between the muscular and cellular fibres; whence he determines the ligaments, pericranium, meninges of the brain, and all the membranes composed of the cellular substance, to be void of irritability. The tendons are unirritable; and though he does not absolutely deny irritability to the arteries, yet his experiments on the aorta produced no contraction. The veins and excretory ducts are in a small degree irritable, and the gall bladder, the ductus chole-dochus, the ureters and urethra, are only affected by a very acrid corrosive; but the lacteal vessels are considerably irritable. The glands and mucous sinuses, the uterus in quadrupeds, the human matrix, and the genitals, are all irritable; as are also the muscles, particularly the diaphragm. The œsophagus, stomach, and intestines, are irritable: but of all the animal organs the heart is endued with the greatest irritability. In general, there is nothing irritable in the animal body but the muscular fibres; and the vital parts are the most irritable. This power of motion, arising from irritations, is supposed to be different from all other properties of bodies, and probably resides in the glutinous mucus of the muscular fibres, altogether independent of the influence of the soul. The irritability of the muscles is said to be destroyed by drying of the fibres, congealing of the fat, and more especially by the use of opium in living animals. The physiological system, of which an abstract has been now given, has been adopted and confirmed by Catell and Zimmermann, and also by Dr Brocklesby, who suggests, that irritability, as distinguished from sensibility, may depend upon a series of nerves different from such as serve either for voluntary motion or sensation. This doctrine, however, has been controverted by M. le Cat, and particularly by Dr Whytt in his *Physiological Essays*. See also **ANATOMY**, n<sup>o</sup> 86, *et seq.* and n<sup>o</sup> 136.

**IRROGATIO**, a law term amongst the *Romans*, signifying the instrument in which were put down the punishments which the law provided against such offences as any person was accused of by a magistrate before the people. These punishments were first proclaimed *viva voce* by the accuser, and this was called *Inquisitio*:

The

argo The same, being immediately after expressed in writing, took the name of *Rogatio*, in respect of the people, who were to be consulted or asked about it, and was called *Irrogatio* in respect of the criminal, as it imported the mulct or punishment assigned him by the accuser.

IRROMANGO, or ERRAMONGO, one of the New Hebrides islands, is about 24 or 25 leagues in circuit; the middle of it lies in E. Long. 169. 19. S. Lat. 18. 54. The inhabitants are of the middle size, and have a good shape and tolerable features. Their colour is very dark; and they paint their faces, some with black, and others with red pigment: their hair is curly and crisp, and somewhat woolly. Few women were seen, and these very ugly: they wore a petticoat made of the leaves of some plant. The men were quite naked, excepting a belt tied about the waist, and a piece of cloth, or a leaf, used for a wrapper. No canoes were seen in any part of the island. They live in houses covered with thatch; and their plantations are laid out by line, and fenced round. An unlucky scuffle between the British sailors and these people, in which four of the latter were desperately wounded, prevented captain Cook from being able to give any particular information concerning the produce, &c. of this island.

IRTIS, a large river of Asia, in Siberia, which rises among the hills of the country of the Kalmucks, and, running north east, falls into the Ob near Tobolik. It abounds with fish, particularly sturgeon, and delicate salmon.

IRVINE, a sea port and parliament town of Scotland, in the bailiwick of Cunningham; seated at the mouth of a river of the same name on the frith of Clyde, in W. Long. 2. 55. N. Lat. 55. 36. This port had formerly several buoys in the herring-fishery. At present that branch is given up; but the inhabitants still employ a number of brigs in the coal-trade to Ireland. Irvine had a viscount's title, now extinct.

ISAAC, the Jewish patriarch, and example of filial obedience, died 1716 B. C. aged 180.

ISÆUS, a Greek orator, born at Colchis, in Syria, was the disciple of Lyfias, and the master of Demosthenes; and taught eloquence at Athens, about 344 years B. C. Sixty four orations are attributed to him; but he composed no more than 50, of which only 10 are now remaining. He took Lyfias for his model, and so well imitated his style and elegance, that we might easily confound the one with the other, were it not for the figures which Isæus first introduced into frequent use. He was also the first who applied eloquence to politics, in which he was followed by his disciple Demosthenes.

He ought not to be confounded with Isæus, another celebrated orator, who lived at Rome in the time of Pliny the Younger, about the year 97.

ISAIAH, or *the Prophecy of ISAIAH*, a canonical book of the Old Testament. Isaiah is the first of the four greater prophets; the other three being Jeremiah, Ezekiel, and Daniel. This prophet was of royal blood, his father Amos being brother to Azariah king of Judah. The five first chapters of his prophecy relate to the reign of Uzziah; the vision in the sixth chapter happened in the time of Jotham: the next chapters, to the fifteenth, include his prophecies under the reign of Ahaz; and those that were made un-

der the reigns of Hezekiah and Manasseh, are related in the next chapters to the end. Isaiah foretold the deliverance of the Jews from their captivity in Babylon by Cyrus, one hundred years before it came to pass. But the most remarkable of his predictions are those concerning the Messiah, which describe not only his descent, but all the remarkable circumstances of his life and death. The style of this prophet is noble, nervous, sublime, and florid, which he acquired by converse with men of the greatest abilities and elocution: Grotius calls him the Demosthenes of the Hebrews. However, the profoundness of his thoughts, the loftiness of his expressions, and the extent of his prophecy, render him one of the most difficult of all the prophets; and the commentaries that have been hitherto written on his prophecy fall short of a full explication of it. Bishop Lowth's new translation, &c. published in 1778, throws considerable light on the composition and meaning of *Isaiab*.

ISATIS, WOAD: A genus of the siliquosa order, belonging to the tetradynamia class of plants; and in the natural method ranking under the 39th order, the *Siliquosa*. The silqua is lanceolated, unilocular, monospermous, bivalved, and deciduous; the valves navicular or canoe-shaped. There are four species; but the only one worthy of notice is the tinctoria, or common woad, which is cultivated in several parts of Britain for the purposes of dyeing; being used as a foundation for many of the dark colours. See *COLOUR-Making*, n<sup>o</sup> 37; and *WOAD*.

The plant is biennial; the lower leaves are of an oblong oval figure, and pretty thick consistence, ending in obtuse roundish points; they are entire on their edges, and of a lucid green. The stalks rise four feet high, dividing into several branches, garnished with arrow-shaped leaves sitting close to the stalks; the branches are terminated by small yellow flowers, in very close clusters, which are composed of four small petals, placed in form of a cross, which are succeeded by pods shaped like a bird's tongue, which, when ripe, turn black, and open with two valves, having one cell, in which is situated a single seed.

This sort is sown upon fresh land which is in good heart, for which the cultivators of woad pay a large rent. They generally choose to have their lands situated near great towns, where there is plenty of dressing; but they never stay long on the same spot: for the best ground will not admit of being sown with woad more than twice; and if it is oftener repeated, the crop seldom pays the charges of culture, &c. Those who cultivate this commodity have gangs of people who have been bred to the employment; so that whole families travel about from place to place wherever their principal fixes on land for the purpose. As the goodness of woad consists in the size and fatness or thickness of the leaves, the only method to obtain this, is by sowing the seed upon ground at a proper season, and allowing the plants proper room to grow; as also to keep them clean from weeds, which, if permitted to grow, will rob the plants of their nourishment. After having made choice of a proper spot of land, which should not be too light and sandy, nor over stiff and moist, but rather a gentle hazel loam, whose parts will easily separate, the next is to plough this up just before winter, laying it in narrow high ridges, that

Hatis.

the frost may penetrate through the ridges to mellow and soften the clods; then in the spring plough it again crosswise, laying it again in narrow ridges. After it has lain for some time in this manner, and the weeds begin to grow, it should be well harrowed to destroy them: this should be repeated twice while the weeds are young; and, if there are any roots of large perennial weeds, they must be harrowed out, and carried off the ground. In June the ground should be a third time ploughed, when the furrows should be narrow, and the ground stirred as deep as the plough will go, that the parts may be as well separated as possible; and when the weeds appear again, the ground should be well harrowed to destroy them. Toward the end of July, or the beginning of August, it should be ploughed the last time, when the land should be laid smooth; and when there is a prospect of showers, the ground must be harrowed to receive the seeds, which should be sown in rows with the drill-plough, or in broad-cast after the common method; but it will be proper to steep the seeds one night in water before they are sown, which will prepare them for vegetation: if the seeds are sown in drills, they will be covered with an instrument fixed to the plough for that purpose, but those which are sown broad-cast in the common way must be well harrowed in. If the seeds are good, and the season favourable, the plants will appear in a fortnight, and in a month or five weeks will be fit to hoe; for the sooner this is performed when the plants are distinguishable, the better they will thrive, and the weeds being then young will be soon destroyed. The method of hoeing these plants is the same as for turnips: with this difference only, that these plants need not be thinned so much; for at the first hoeing, if they are separated to the distance of four inches, and at the last to six inches, it will be space enough for the growth of the plants; and if this is carefully performed, and in dry weather, most of the weeds will be destroyed: but as some of them may escape in this operation, and young weeds will rise, so the ground should be a second time hoed in the beginning of October, always choosing a dry time for this work; at this second operation, the plants should be singled out to the distance they are to remain. After this, if carefully performed, the ground will be clean from weeds till the spring, when young weeds will come up: therefore about the middle of March will be a good time to hoe the ground again; for while the weeds are young, it may be performed in less than half the time it would require if the weeds were permitted to grow large, and the sun and wind will much sooner kill them: this hoeing will also stir the surface of the ground, and greatly promote the growth of the plants; if this is performed in dry weather, the ground will be clean till the first crop of woad is gathered, after which it must be again well cleaned; if this is carefully repeated after the gathering each crop, the land will always lie clean, and the plants will thrive the better. The expence of the first hoeing will be about six shillings *per* acre, and for the after hoeings half that price will be sufficient, provided they are performed when the weeds are young, for if they are suffered to grow large, it will require more labour, nor can it be so well performed.

If the land, in which this seed is sown, should have

been in culture before for other crops, so not in good heart, it will require dressing before it is sown, in which case rotten stable-dung is preferable to any other; but this should not be laid on till the last ploughing, just before the seeds are sown, and not spread till the land is ploughed, that the sun may not exhale the goodness of it, which in summer is soon lost when spread on the ground. The quantity should not be less than 20 loads to each acre, which will keep the ground in heart till the crop of woad is spent.

The time for gathering of the crop is according to the season: but it should be performed as soon as the leaves are fully grown, while they are perfectly green; for when they begin to change pale, great part of their goodness is over, for the quantity will be less, and the quality greatly diminished.

If the land is good, and the crop well husbanded, it will produce three or four gatherings; but the two first are the best. These are commonly mixed together in the manufacturing of it; but the after crops are always kept separate; for if these are mixed with the other, the whole will be of little value. The two first crops will sell from 25 l. to 30 l. a ton; and the latter will not bring more than 7 l. or 8 l. and sometimes not so much. An acre of land will produce a ton of woad, and in good seasons near a ton and an half.

When the planters intend to save the seeds, they cut three crops of the leaves, and then let the plants stand till the next year for seed; but if only one crop is cut, and that only of the outer leaves, letting all the middle leaves stand to nourish the stalks, the plants will grow stronger, and produce a much greater quantity of seeds.

These seeds are often kept two years, but it is always best to sow new seeds when they can be obtained. The seeds ripen in August; and when the pods turn to a dark colour, the seeds should be gathered. It is best done by reaping the stalks in the same manner as wheat, spreading the stalks in rows upon the ground: and in four or five days the seeds will be fit to thresh out, provided the weather is dry; for if it lies long, the pods will open and let out the seeds.

There are some of the woad planters who feed down the leaves in winter with sheep; which is a very bad method: for all plants which are to remain for a future crop should never be eaten by cattle, for that greatly weakens the plants; therefore those who eat down their wheat in winter with sheep are equally blameable.

ISATIS, in zoology, a synonyme of the *canis lagopus*. See CANIS.

ISAURA, or ISATURUS (anc. geog.), a strong city at mount Taurus, in Iauria, twice demolished; first by Perdiccas, or rather by the inhabitants, who, thro' despair, destroyed themselves by fire, rather than fall into the hands of the enemy; again by Servilius, who thence took the surname *Iauricus*. Strabo says there were two Iauras, the old and the new, but so near that other writers took them but for one.

ISAURIA, a country touching Pamphylia and Cilicia on the north, rugged and mountainous, situated almost in mount Taurus, and taking its name from Isaura; according to some, extending to the Mediterranean by a narrow slip. Stephanus, Ptolemy, and Zosimus, make no mention of places on the sea; though Pliuy does,

urica  
||  
sticks.

docs, as also Strabo; but doubtful, whether they are places in Iauria Proper, or in Pamphylia, or in Cilicia.

ISAURICA, a part of Lycaonia, bordering on mount Taurus.

ISCA DUMNIORUM (anc. geog.); a town in Britain. Now Exeter, capital of Devonshire. W. Long. 3° 40', Lat. 51° 44'. Called *Caer-Iſk* in British, (Camden.)

ISCA SILURUM (anc. geog.); the station of the Legion II. Augusta, in Britain. Now *Caerleon*, a town of Monmouthshire, on the Uſke.

ISCHALIS, or ISCALIS (anc. geog.); a town of the Belgæ in Britain. Now *Icheſter*, in Somerſetſhire, on the river Ill.

ISCHÆMUM, in botany: A genus of the monœcia order, belonging to the polygamia claſs of plants; and in the natural method ranking under the 4th order, *Gramina*. The calyx of the hermaphrodite is a biſlorous glume; the corolla bivalved; there are three ſtamina, two ſtyles, and one ſeed. The calyx and corolla of the male as in the former with three ſtamina.

ISCHIUM, in anatomy, one of the bones of the pelvis. See ANATOMY, p. 31.

ISCHIA, an iſland of Italy, in the kingdom of Naples, about 15 miles in circumference, lying on the coaſt of the Terra di Lavoro, from which it is three miles diſtant. It is full of agreeable valleys, which produce excellent fruits. It hath alſo mountains on which grow vines of an excellent kind: likewiſe fountains, rivulets, and fine gardens.

ISCHIA, a town of Italy, and capital of an iſland of the ſame name, with a biſhop's ſee and a ſtrong fort. Both the city and fortrefs ſtand upon a rock, which is joined to the iſland by a ſtrong bridge; the rock is about ſeven furlongs in circumference. The city is like a pyramid of houſes piled upon one another, which makes a very ſingular and ſtriking appearance. At the end of the bridge next the city are iron gates, which open into a ſubterraneous paſſage, through which they enter the city. They are always guarded by ſoldiers who are natives of the iſland. E. Long. 13. 55. N. Lat. 40. 50.

ISCHURIA, *ισχυρία* (formed from *ισχυρ* "I ſtop," and *ουρον* "urine," in phyſic), a diſeaſe conſiſting in an entire ſuppreſſion of urine. See MEDICINE *Index*.

It is occaſioned by any thing which may obſtruct the paſſages of the reins, ureters, or the neck of the bladder, as ſand, ſtone, mucus, &c. It may alſo ariſe from an obſtruction of the nerves which paſs to the reins or bladder, as we ſee it does in a paly of the parts below the diaphragm. The too great diſtenſion of the bladder may alſo produce the ſame effect: for the fibres being much lengthened, and conſequently condensed, the ſpirits neceſſary for their contraction cannot get admittance; whence it is that perſons who have retained their urine a long time, find a great deal of difficulty in diſcharging it.

ISELASTICS, a kind of games, or combats, celebrated in Greece and Aſia, in the time of the Roman emperors.

The victor at theſe games had very conſiderable privileges conferred on him, after the example of Auguſtus and the Athenians, who did the like to con-

querors at the Olympic, Pythian, and Iſthmian games. They were crowned on the ſpot immediately after their victory, had penſions allowed them, were furniſhed with provisions at the public coſt, and were carried in triumph to their country.

ISENACH, a town of Germany, in the circle of Upper Saxony, from whence one of the Saxon princes takes the title of *duke*. There are iron mines in the neighbourhood. E. Long. 9. 17. N. Lat. 51. 0.

ISENARTS, or EISENARTS, a conſiderable town of Germany in Auſtria and in Styria; famous for its iron mines. E. Long. 15. 25. N. Lat. 46. 56.

ISENBURG, a large town of Germany, capital of a county of the ſame name, with a handſome caſtle, ſeated on the river Seine, in E. Long. 7. 14. N. Lat. 50. 28. The county belongs to the elector of Treves.

ISENGHEIN, a town of the Auſtrian Netherlands, with the title of a *principality*, ſeated on the river Mandera, in E. Long. 3. 18. N. Lat. 50. 44.

ISERNIA, a town of Italy, in the kingdom of Naples, and in the county of Molife, with a biſhop's ſee. It is ſeated at the foot of the Appenines, in E. Long. 14. 20.

ISH, in Scots law, ſignifies *expiry*. Thus we ſay "the *iſh* of a leaſe." It ſignifies alſo to *go out*; thus we ſay "free *iſh* and entry" from and to any place.

ISIA, *Ἴσις*, ſeals and ſacrifices anciently ſolemnized in honour of the goddeſs Iſis.—The Iſia were full of the moſt abominable impurities; and for that reaſon, thoſe who were initiated into them were obliged to take an oath of ſecrecy. They held for nine days ſucceſſively, but grew ſo ſcandalous, that the ſenate aboliſhed them at Rome, under the conſulate of Piſo and Gabinus. They were re-eſtabliſhed by Auguſtus, and the emperor Commodus himſelf aſſiſted at them, appearing among the prieſts of that goddeſs with his head ſhaven, and carrying the Anubis.

ISIAC TABLE is one of the moſt conſiderable monuments of antiquity, diſcovered at Rome in 1525, and ſupported by the various figures in bas relief upon it, to repreſent the feaſts of Iſis, and other Egyptian deities. There have been various opinions as to the antiquity of this monument: ſome have ſuppoſed that it was engraven long before the time when the Egyptians worſhipped the figures of men and women. Others, among whom is biſhop Warburton, apprehend, that it was made at Rome by perſons attached to the worſhip of Iſis. Dr Warburton conſiders it as one of the moſt modern of the Egyptian monuments, on account of the great mixture of hieroglyphic characters which it bears.

ISIACI, prieſt of the goddeſs Iſis.—Dioſcorides tells us, that they bore a branch of ſea-wormwood in their hands inſtead of olive. They ſung the praifes of the goddeſs twice a-day, viz. at the riſing of the ſun, when they opened her temple; after which they begged alms the reſt of the day, and returning at night, repeated their orifons, and ſhut up the temple.

Such was the life and office of the *Iſiaci*; they never covered their feet with any thing but the thin bark of the plant papyrus, which occaſioned Prudentius and others to ſay they went bare-footed. They

Iſenach  
||  
Iſiaci.

Diodorus  
||

Island.

wore no garments but linen, because Isis was the first who taught mankind the culture of this commodity.

ISIDORUS, called DAMIATENSIS, or PELUSIOTA, from his living in a solitude near that city, was one of the most famous of all St Chrysofom's disciples, and flourished in the time of the general council held in 421. We have 2012 of his epistles in five books. They are short, but well written, in Greek. The best edition is that of Paris, in Greek and Latin, printed in 1633, in folio.

ISIGNI, a town of France, in Lower Normandy, with a small harbour, and well known on account of its salt works, its cyder, and its butter. W. Long. 0. 50. N. Lat. 49. 20.

ISINGLASS. See ICHTHYOCOLLA.

ISIS, a celebrated deity of the Egyptians, daughter of Saturn and Rhea, according to Diodorus of Sicily. Some suppose her to be the same as Io, who was changed into a cow, and restored to her human form in Egypt, where she taught agriculture, and governed the people with mildness and equity, for which reasons she received divine honours after death. According to some traditions mentioned by Plutarch, Isis married her brother Osiris, and was pregnant by him even before she had lost her mother's womb. These two ancient deities, as some authors observe, comprehended all nature and all the gods of the heathens. Isis was the Venus of Cyprus, the Minerva of Athens, the Cybele of the Phrygians, the Ceres of Eleusis, the Proserpine of Sicily, the Diana of Crete, the Bellona of the Romans, &c. Osiris and Isis reigned jointly in Egypt; but the rebellion of Typhon, the brother of Osiris, proved fatal to this sovereign. The ox and the cow were the symbols of Osiris and Isis; because these deities, while on earth, had diligently applied themselves in cultivating the earth. As Isis was supposed to be the moon as Osiris the sun, she was represented as holding a globe in her hand, with a vessel full of ears of corn. The Egyptians believed that the yearly and regular inundations of the Nile proceeded from the abundant tears which Isis shed for the loss of Osiris, whom Typhon had basely murdered. The word *Isis*, according to some, signifies "ancient," and on that account the inscriptions on the statues of the goddesses were often in these words: "I am all that has been, that shall be, and none among mortals has hitherto taken off my veil." The worship of Isis was universal in Egypt, the priests were obliged to observe perpetual chastity, their head was closely shaved, and they always walked barefooted, and clothed themselves in linen garments. They never eat onions, they abstained from salt with their meat, and were forbidden to eat the flesh of sheep and of hogs. During the night they were employed in continual devotion near the statue of the goddess. Cleopatra, the beautiful queen of Egypt, was wont to dress herself like this goddess, and affected to be called a second Isis.

ISIS, or *Thames*, a river that has its rise in Gloucestershire, and flows through only a small part of Wiltshire. It enters this county near its source, and begins to be navigable for boats at Cricklade; but after running in a serpentine manner about four miles, it leaves Gloucestershire at a village called *Castle Eaton*.

ISLAM; the true faith, according to the Mahometans. See MAHOMETANISM.

ISLAND, a tract of dry land encompassed with water; in which sense it stands contradicting *Island* from CONTINENT, or TERRA FIRMA

Several naturalists are of opinion, that the islands were formed at the deluge; others think, that there have been new islands formed by the casting up of vast heaps of clay, mud, sand, &c.; others think they have been separated from the continent by violent storms, inundations, and earthquakes. These last have observed, that the East Indies, which abound in islands more than any other part of the world, are likewise more annoyed with earthquakes, tempests, lightnings, volcanoes, &c. than any other part. Others again conclude, that islands are as ancient as the world, and that there were some at the beginning; and, among other arguments, support their opinion from Gen. x. 5. and other passages of Scripture.

Varenius thinks that there have been islands produced each of these ways. St Helena, Ascension, and other steep rocky islands, he supposes to have become so by the sea's overflowing their neighbouring champaigns: but by the heaping up huge quantities of sand, and other terrestrial matter, he thinks the islands of Zealand, Japan, &c. were formed. Sumatra and Ceylon, and most of the East India islands, he thinks, were rent off from the main land; and concludes, that the islands of the Archipelago were formed in the same way, imagining it probable that Deucalion's flood might contribute towards it. The ancients had a notion that Delos, and a few other islands, rose from the bottom of the sea; which, how fabulous soever it may appear, agrees with later observations. Seneca takes notice, that the island Therasia rose thus out of the Ægean sea in his time, of which the mariners were eye-witnesses.

It is indeed very probable, that many islands have existed not only from the deluge, but from the creation of the world; and we have undoubted proofs of the formation of islands in all the different ways above-mentioned. Another way, however, in which islands are frequently formed in the South Sea, is by the coralline insects. On this subject the following curious dissertation by Alexander Dalrymple, Esq; hath appeared in the Philosophical Transactions for the year 1767.

"These islands are generally long and narrow: they are formed by a narrow bar of land, inclosing the sea within it; generally, perhaps always, with some ingress at least to the tide; commonly with an opening capable of receiving a canoe, and frequently sufficient to admit even larger vessels.

"The origin of these islands will explain their nature. What led me first to this deduction was an observation of Abdul Roobin, a Sooloo pilot, that all the islands lying off the north-east coast of Borneo had shoals to the eastward of them.

"These islands being covered to the westward by Borneo, the winds from that quarter do not attack them with violence. But the north-east winds, tumbling in the billows from a wide ocean, heap up the coral with which those seas are filled. This, obvious after storms, is perhaps at all other times imperceptibly effected.

"The coral banks, raised in the same manner, become dry. These banks are found of all depths, at all

all distances from shore, entirely unconnected with the land, and detached from each other: although it often happens that they are divided by a narrow gut without bottom.

"Coral banks also grow, by a quick progression, towards the surface; but the winds, heaping up the coral from deeper water, chiefly accelerate the formation of these into shoals and islands. They become gradually shallower; and, when once the sea meets with resistance, the coral is quickly thrown up by the force of the waves breaking against the bank; and hence it is, that, in the open sea, there is scarce an instance of a coral bank having so little water that a large ship cannot pass over, but it is also so shallow that a boat would ground on it.

"I have seen these coral banks in all the stages; some in deep water, others with few rocks appearing above the surface; some just formed into islands, without the least appearance of vegetation; and others from such as have a few weeds on the highest part, to those which are covered with large timber, with a bottomless sea at a pistol-shot distance.

"The loose coral, rolled inward by the billows in large pieces, will ground; and the reflux being unable to carry them away, they become a bar to congregate the sand, always found intermixed with coral; which sand, being easiest raised, will be lodged at top. When the sand bank is raised by violent storms beyond the reach of common waves, it becomes a resting-place to vagrant birds, whom the search of prey draws thither. The dung, feathers, &c. increase the soil, and prepare it for the reception of accidental roots, branches, and seed, cast up by the waves, or brought thither by birds. Thus islands are formed: the leaves and rotten branches intermixing with the sand, form in time a light black mould, of which in general these islands consist; more sandy as less woody; and, when full of large trees, with a greater proportion of mould.

"Cocoa nuts, continuing long in the sea without losing their vegetative powers, are commonly to be found in such islands; particularly as they are adapted to all soils, whether sandy, rich, or rocky.

"The violence of the waves within the tropics, must generally be directed to two points, according to the monsoons.

"Hence the islands formed from coral banks must be long and narrow, and lie nearly in a meridional direction. For even supposing the banks to be round, as they seldom are when large, the sea, meeting most resistance in the middle, must heave up the matter in greater quantities there than towards the extremities: and, by the same rule, the ends will generally be open, or at least lowest. They will also commonly have soundings there, as the remains of the bank, not accumulated, will be under water.

"Where the coral banks are not exposed to the common monsoon, they will alter their direction; and be either round, extending the parallel, or be of irregular forms, according to accidental circumstances.

"The interior parts of these islands being sea, sometimes form harbours capable of receiving vessels of some burthen, and, I believe, always abound greatly with fish; and, such as I have seen, with turtle-

grafs and other sea-plants, particularly one species, called by the Sooloos *gamnye*, which grows in little globules, and is somewhat pungent, as well as acid, to the taste.

"It need not be repeated, that the ends of those islands only are the places to expect soundings; and they commonly have a shallow spit running out from each point.

"Abdul Roobin's observation points out another circumstance, which may be useful to navigators; by consideration of the winds to which any islands are most exposed, to form a probable conjecture which side has deepest water; and from a view which side has the shoals, an idea may be formed which winds rage with most violence."

Islands from their situation enjoy many great advantages, the principal of which are these. In the first place, many benefits are derived to the inhabitants of an island from its unity. The very largest country on a continent is still but a part, which implies dependence, and is necessarily attended with a train of imperfections; from all of which, by the unerring and unalterable laws of nature, the people who live in an island are or may be entirely free. All countries on the continent are exposed to continual dangers, against which their inhabitants must be perpetually upon their guard. This renders a large military force requisite. It involves them in continual negociations, leagues, and alliances; all of which, however, cannot exempt them from frequent wars, or the miseries that attend them, and which have commonly bad effects on their internal policy. In the next place, the climate is generally mild and salubrious from the vapours of the surrounding sea, which according to the latitude abates the violence of heat, and moderates the rigour of cold, both which are sensibly and constantly less than on continents under the same elevation of the pole. We have a remarkable instance of this in the islands called anciently *Stabades*, in the modern Latin *Insulae Arcarum*, by us the islands of *Hieris*. They are three in number, lying in 43° north latitude, before the port of Toulon. In them, the fruits of France and Italy arrive at the highest perfection, and all the medical herbs of Italy, Greece, and Egypt, grow wild. Yet the climate is wonderfully temperate and pleasant in all seasons\*.—There is also commonly a greater variety,

and always a greater fertility, in the soil, occasioned chiefly by the warmth of the circumambient air, frequent showers, and, in consequence of both, being continually impregnated with vegetable salts. Another considerable advantage arises from its accessibility on every side, by which it is open to receive supplies from other countries, and has the conveniency of exporting its commodities and manufactures to all markets, and, in comparison of the continent, at all seasons. The opposite sides of an island may in regard to commerce be considered as two countries; each has its ports, its proper commodities, its proper correspondencies; in consequence of which, it promotes the cultivation, and procures vent for the manufactures, of a large district behind it; while the intermediate midland space finds a profit in that inland trade, which these two districts supply. The winds contrary on one side are favourable on the other; and the sea, the common road to

both

23.

Island.

both coasts, is continually ploughed by vessels outward and homeward bound, which keeps up that active and enterprising spirit which characterizes islanders. An island has at once the most extensive and the most effectual frontier, and this on all sides, subsisting for ever, without repairs, and without expence: and, which is still more, derives from this very frontier a great part of the subsistence of its inhabitants, and a valuable article in its commerce, from its fisheries. It is commonly said the sea is a mine, but in truth it is better; its treasures are more lasting and more certain, procured by labour solely, and fit for use or for sale as soon as procured, quickly consumed, and thereby the source of continual employment to a stout, hardy, laborious race of men, who likewise find employment for numbers, and are in various respects otherwise beneficial members of the community. The defence of this natural barrier, which, as we have said, costs nothing, but on the contrary yields much, is not only permanent, but in every respect more to be relied on than any that could be raised by the skill and industry of men at the greatest expence. All these blessings and benefits are insured by the lesson that Nature dictates, some would say the law which she prescribes, to the inhabitants of every island, to place all their hopes in the assiduous cultivation of their own country, to bend all their endeavours to raising and extending their commerce, and to put their trust in Providence, and in the safeguard which she directs; men accustomed to robust and hardy exercises, and in what necessarily arises from their way of life, a naval force. The first inhabitants come in vessels, are for a time dependent on the country from whence they came, arrive at independence by enlarging their correspondence: and thus commerce is natural and essential to the people of an island; which is the reason that they thrive so long as they possess it, and gradually decline in the same proportion in which that decays.

*ISLANDS of Ice.* See *ICE-Island*.

*Floating-ISLANDS.* Histories are full of accounts of floating islands; but the greatest part of them are either false or exaggerated. What we generally see of this kind is no more than the concretion of the lighter and more viscous matter floating on the surface of the water in cakes; and, with the roots of the plants, forming congeries of different sizes, which, not being fixed to the shore in any part, are blown about by the winds, and float on the surface. These are generally found in lakes, where they are confined from being carried too far; and, in process of time, some of them acquire a very considerable size. Seneca tells us of many of these floating islands in Italy; and some later writers have described not a few of them in other places. But, however true these accounts might have been at the time when they were written, very few proofs of their authenticity are now to be found; the floating islands having either disappeared again, or been fixed to the sides in such a manner as to make a part of the shore. Pliny tells us of a great island which at one time swam about in the lake Cutilia in the country of Reatinum, which was discovered to the old Romans by a miracle; and Pomponius tells us, that in Lydia there were several islands so loose in their found-

Nº 169.

ations, that every little accident shook and removed them.

*ISLAND (or Iceland) Crystal.* See *CRYSTAL (Ice-land)*.

*ISLE-ADAM*, a town of France, with a handsome castle, and the title of a baron; seated on the river Oise, three miles from Beaumont, and 20 from Paris. E. Long. 2. 13. N. Lat. 49 7.

*ISLE-de-Dieu*, a small island of France in the sea of Gascony, and on the coast of Poitou, from which it is 14 miles. W. Long. 2. 5. N. Lat. 46. 45.

*ISLE-de-France*, is one of the 12 general governments of France; bounded on the north by Picardy, on the west by Normandy, on the south by the government of Orleannois, and on the east by that of Champagne. It is about 90 miles in length, and as much in breadth; and is watered by the rivers Seine, Marne, Oise, and Aisne. The air is temperate, and the soil fertile; and it abounds in wine, corn, and fruits. It contains 10 small districts, and Paris is the capital city.

*ISLEBIANS*, in ecclesiastical history, a name given to those who adopted the sentiments of a Lutheran divine of Saxony, called John Agricola, a disciple and companion of Luther, a native of Illeb, whence the name; who interpreting literally some of the precepts of St Paul with regard to the Jewish law, declaimed against the law and the necessity of good works. See *ANTINOMIANS*.

*ISLINGTON*, a village of Middlesex, on the north side of London, to which it is almost contiguous. It appears to be of Saxon origin; and in the conqueror's time was written *Isledon*, or *Isendon*. The church is one of the prebends of St Paul's; to the dean and chapter of which a certain precinct here belongs, for the probate of wills, and granting administrations. The church was a Gothic structure, erected in 1503, and stood till 1751, when the inhabitants applied to parliament for leave to rebuild it, and soon after erected the present structure, which is a very substantial brick edifice, though it does not want an air of lightness. Its houses are above 2000, including the Upper and Lower Holloways, three sides of Newington-Green, and part of King'sland, on the road to Ware. The White Conduit-house in this place, so called from a white stone conduit that stands before the entrance, has handsome gardens with good walks, and two large rooms one above the other for the entertainment of company at tea, &c. In the S. W. part of this village is that noble reservoir, improperly called *New-River Head*; though they are only two basons, which receive that river from Hertfordshire, and from whence the water is thrown by an engine into the company's pipes for the supply of London. In the red-moat on the north side of these basons, called *Six-Acre-Field*, from the contents of it, which is the third field beyond the White Conduit, there appears to have been a fortress in former days, inclosed with a rampart and ditch, which is supposed to have been a Roman camp made use of by Suetonius Paulinus after his retreat, which Tacitus mentions, from London, before he sallied thence, and routed the Britons under their queen Boadicea; and that which is vulgarly, but erroneously, called *Jack Straw's castle*, in a square place in the S. W. angle of the field, supposed to have been the seat

feat of the Roman general's pretorium or tent. In this parish are two charity-schools; one founded in 1613 by Dame Alice Owen, for educating 30 children. This foundation, together with that of a row of alms-houses, are under the care of the brewers company. Here is an hospital with its chapel, and a work-house for the poor. There is a spring of chalybeate water, in a very pleasant garden, which for some years was honoured by the constant attendance of the princess Amelia, and many persons of quality, who drank the waters. To this place, which is called New Tunbridge Wells, many people resort, particularly during the summer, the price of drinking the waters being 10s. 6d. for the season. Near this place is a house of entertainment called Saddler's Wells, where, during the summer season, people are amused with balance madders, walking on the wire, rope-dancing, tumbling, and pantomime entertainments.

ISLIP, a town of Oxfordshire, 56 miles from London, is noted for the birth and baptism of Edward the Confessor. By the late inland navigation, it has communication with the rivers Mersey, Dee, Ribble, Ouse, Trent, Darwent, Severn, Humber, Thames, Avon, &c. which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, York, Lancaster, Westmoreland, Chester, Stafford, Warwick, Leicester, Oxford, Worcester, &c. It has a good market for sheep, and some remains of an ancient palace, said to have been king Ethelred's. Here is a charity-school. The chapel wherein Edward was baptized stood at a small distance north from the church, is still called the king's chapel, was entirely defaced during Cromwell's usurpation, and converted to the meanest uses of a farm-yard; at present it has a roof of thatch. It is built of stone 15 yards long and 7 broad, and retains traces of the arches of an oblong window at the east end. This manor was given by Edward the Confessor to Westminster abbey, to which it still belongs.

ISMAELITES, the descendants of Ismael; dwelling from Havila to the wilderness of Sur, towards Egypt, and thus overspreading Arabia Petræa, and therefore Josephus calls Ismael the founder of the Arabs.

ISMARUS (anc. geog.), a town of the Cicones in Thrace, giving name to a lake. In Virgil it is called Ismara. Servius supposes it to be a mountain of Thrace; on which mountain Orpheus dwelt.

ISNARDIA, in botany: A genus of the monogynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 17th order, *Calycanthemæ*. There is no corolla; the calyx is quadrifid; the capsule quadrilocular, and girt with the calyx.

ISNY, an imperial town of Germany, in Suabia, and in Algow; seated on the river Isny, in E. Long. 9. 10. N. Lat. 47. 33.

ISNIC, a town of Turkey in Asia, and in Natolia, with a Greek archbishop's see. It is the ancient Nice, famous for the first general council held here in 325. There is now nothing remaining of its ancient splendor but an aqueduct. The Jews inhabit the greatest part of it; and it is seated in a country fertile in corn and excellent wine. E. Long. 30. 9. N. Lat. 47. 15.

ISOCHRONAL, is applied to such vibrations of

a pendulum as are performed in the same space of time; as all the vibrations or swings of the same pendulum are, whether the arches it describes are shorter or longer.

*ISOCHRONAL-Line*, that in which a heavy body is supposed to descend without any acceleration.

ISOCRATES, one of the greatest orators of Greece, was born at Athens, 436 B. C. He was the son of Theodorus, who had enriched himself by making musical instruments, and gave his son a liberal education. Isocrates was the disciple of Prodicus, Gorgias, and other great orators. He endeavoured at first to declaim in public, but without success; he therefore contented himself with instructing his scholars, and making private orations. He always showed great love for his country; and being informed of the loss of the battle of Cheronea, he obtained four days from eating, and died, aged 98. There are still extant 21 of his discourses or orations, which are excellent performances, and have been translated from the Greek into Latin by Wolfius. Isocrates particularly excelled in the justness of his thoughts, and the elegance of his expressions. There are also nine letters attributed to him.

ISOETES, in botany; a genus of the natural order of filices, belonging to the cryptogamia class of plants. The antheræ of the male flower are within the base of the frons or leaf. The capsule of the female flower is bilocular, and within the base of the leaf.

ISOLA, a town of Italy, in the kingdom of Naples, and in the Farther Calabria, with a bishop's see. It is a sea port town, and is seated 15 miles south-east of St Severina. E. Long. 7. 33. N. Lat. 39. 1.

ISOPERIMETRICAL FIGURES, in geometry, are such as have equal perimeters or circumferences.

ISOPYRUM, in botany: A genus of the polygynia order, belonging to the polyandria class of plants; and in the natural method ranking under the 26th order, *Multifiliqueæ*. There is no calyx, but five petals; the nectaria trifid and tubular; the capsules recurved and polyspermous.

ISOSCELES TRIANGLE, in geometry, one that has two equal sides

ISPAHAN, or, as the Persians pronounce it, *Staubawn*, the capital of Persia, is situated in the province of Irac, Agemi, or Persia Proper, upon the ruins, as generally supposed, of the ancient Hecatompylos, or, as others think, of the Aspa of Ptolemy. Most of the eastern astronomers and geographers place it in N. Lat. 32. 25. E. Long. 86. 40. It stands in a very extensive plain, surrounded by mountains; and has eight districts belonging to it, that contain about 400 towns and villages. The fertility of the soil, the mildness of the seasons, and the fine temperature of the air, all conspire to render Ispahan one of the most charming and delightful cities in the world. It is unanimously agreed, that the present city is of no great antiquity; and the two parts into which it is divided, preserve the names of two contiguous towns, from the junction of which it was formed. The inhabitants of these, notwithstanding their neighbourhood, bear an inveterate antipathy to each other; which they discover on all public occasions. Spauhawu

Ispahan.

owes the glory it now possesses to the great Shah Abbas; who, after the conquest of the kingdoms of Lar and Ormus, charmed with the situation of this place, made it the capital of his empire, between the years 1620 and 1628. The mountains, with which this city is surrounded, defend it alike from the sultry heats of summer and the piercing winds of the winter season; and the plain on which it stands is watered by several rivers, which contribute alike to its ornament and use. Of these rivers, the Zenderoud, after being joined by the Mahmood, passes by Spauhawn; where it has three fine bridges over it, and is as broad as the Seine at Paris. The waters of these united streams are sweet, pleasant, and wholesome, almost beyond comparison; as, indeed, are all the springs found in the gardens belonging to the houses of Spauhawn. The extent of Spauhawn is very great; not less, perhaps, than 20 miles within the walls, which are of earth, poorly built, and so covered with houses and shaded with gardens, that in many places it is difficult to discover them. The Persians are wont to say, *Spauhawn nisfijebon*, i. e. Spauhawn is half the world. Sir John Chardin says, that though some reckoned 11,000,000 inhabitants in it, he did not himself look upon it as more populous than London. At a distance, the city is not easily distinguished; for many of the streets being adorned with plantains, and every house having its garden, the whole looks like a wood. The streets in general are neither broad nor convenient; there being three great evils which attend them: the first is, that being built on common sewers, these are frequently broke up, which is very dangerous, considering that most people are on horseback; the second is, that there are many wells or pits in them, which are not less dangerous; the third arises from the people's emptying all their ordure from the tops of their houses: this last, indeed, is in some measure qualified by the dryness of the air, and by its being quickly removed by the peasants, who carry it away to dung their grounds. Some reckon eight, and others ten gates, besides posterns; but all agree that there is no difficulty of entering at any hour of the day or night. The three principal suburbs annexed to it are, Abbasabad, built by Shah Abbas, and belonging to the people of Tauris; Julfa, inhabited by a colony of Armenians, called by some *New Julfa*, to distinguish it from the ancient city of that name, situated in Armenia, upon the Araxes, whence the original inhabitants of New Julfa were brought; and Ghebr-Abad, or, as the Arabs pronounce it, Kebr-Abad, the street of the magians, occupied entirely by the professors of magism, or the religion of the ancient Persians. The river Zenderoud separates the city of Ispahan and Abas-Abad from Julfa and Ghebr-Abad. This city has suffered greatly since the commencement of the dreadful rebellion in 1721; the whole kingdom from that period, till a few years ago, having been almost a continued scene of blood, ravages, and confusion. A celebrated modern traveller, who was on the spot, tells us, that the inhabitants of Julfa, not many years before the above revolution happened, amounted to 30,000 souls; had 13 churches, and above 100 priests; and paid the Persian court 200 tomans yearly for the free exercise of their religion: that some of the streets were broad and handsome, and planted with

trees, with canals and fountains in the middle; others narrow and crooked, and arched a top; others again, though extremely narrow, as well as turning and winding many ways, were of an incredible length, and resembled so many labyrinths: that, at a small distance from the town, there were public walks adorned with plane-trees on either hand, and ways paved with stones, fountains, and cisterns: that there were above 100 caravanseras for the use of merchants and travellers, many of which were built by the kings and prime nobility of Persia: that, as little rain fell there, the streets were frequently full of dust, which rendered the city disagreeable during a considerable part of the summer; that the citizens, however, to make this inconvenience more tolerable, used to water them when the weather was warmer than usual: that there was a castle in the eastern part of the town, which the citizens looked upon as impregnable, in which the public money, and most of the military stores, were said to be kept: that, notwithstanding the baths and caravanseras were almost innumerable, there was not one public hospital: that most of the public buildings were rather neat than magnificent, though the great meydan or market-place, the royal palace (which is three quarters of a league in circumference), and the alley denominated *Tober-bag* adjoining to it, made a very grand appearance: that the former contained the royal mosque; the building denominated *kayserieb*, where all sorts of foreign commodities were exposed to sale; and the mint, styled by the Persians *feraa-khoneh*, where the current-money of the kingdom was coined: that, besides the native Persian, there were then in Ispahan above 10,000 Indians all supported by trade; 20,000 Georgians, Circassians, and Tartars of Daghestan or Lesgees, with a considerable number of English, Dutch, Portuguese, and a few French: that the Capuchins, discalceated or bare-footed Carmelites, Jesuits, Dominicans, and Austin friars, had likewise their convents here, though they were unable to make any converts; and that there were above 100 mosques and public colleges. But since the fatal period above-mentioned, the suburb of Julfa was almost totally abandoned by the Armenians. The government of Ispahan, 23 leagues long and as many broad, comprehending several districts, most of them formerly well peopled, appeared not many years ago little better than a desert; most of the inhabitants of that fertile and delightful tract being fled and dispersed. Multitudes of them had taken a precarious refuge in the mountains of Loristan, lying between Ispahan and Sufter, whose lands were left untilled, and their houses mouldered into ruins. In short, all the distresses of an unsuccessful war, or the invasion of a barbarous enemy, could not have plunged the people of Ispahan into greater misery than the victories of their tyrannical king Nadir Shah, who seemed more solicitous to humble his own subjects than his enemies. See PERSIA.

ISPIDA, in ornithology. See ALCEDO.

ISRAEL, the name which the angel gave Jacob, after having wrestled with him all night at Mahanaim or Penuel (Gen. xxxii. 1, 2, and 28, 29, 30. and Hosea xii. 3.) It signifies *the conqueror of God*, or *a prince of God*, or, according to many of the ancients, *a man who sees God*.

By the name of Israel is sometimes understood the person

person of Jacob; sometimes the whole people of Israel, or the whole race of Jacob; and sometimes the kingdom of Israel, or of the ten tribes, distinct from the kingdom of Judah.

**ISRAELITES**, the descendants of Israel; who were at first called *Hebrews*, by reason of Abraham, who came from the other side of the Euphrates; and afterwards *Israelites*, from Israel the father of the twelve patriarchs; and lastly *Jews*, particularly after their return from the captivity of Babylon, because the tribe of Judah was then much stronger and more numerous than the other tribes, and foreigners had scarce any knowledge of this tribe.

**ISSACHAR**, one of the divisions of Palestine by tribes; lying to the south of Zabulon, so as by a narrow slip to reach the Jordan, between Zabulon and Manasseh, Josh. xix. But whether it reached to the sea, is a question; some holding that it did: an assertion not easy to be proved, as Joshua makes no mention of the sea in this tribe, nor does Josephus extend it farther than to mount Carmel; and in Josh. xvii. 10. Asher is said to touch Manasseh on the north, which could not be if Issachar extended to the sea.

**ISSOUDUN**, a considerable town of France, in Berry. It carries on a great trade in wood, cattle, cloth, hats, and stockings; is seated partly on a plain, and partly on an eminence. E. Long. 2. 5. N. Lat. 46. 57.

**ISSUE**, in common law, has various applications; being sometimes taken for the children begotten between a man and his wife—sometimes, for profits growing from amercements or fines—sometimes, for profits of lands and tenements—but more frequently for the point of matter depending in suit, whereupon the parties join, and put their cause to the trial of the jury.

In all these occasions, issue has but one signification, which is, an effect of a cause preceding; as the children are the effect of the marriage between the parents; the profits growing to the king or lord, from the punishment of any man's offence, are the effect of his transgression; the point referred to the trial of twelve men, is the effect of pleading, or process. See *PLEA and Issue*.

**ISSUES**, in surgery, are little ulcers made designedly by the surgeon in various parts of the body, and kept open by the patient, for the preservation and recovery of his health.

**ISSUS**, now *AJAZO*, a town of Cilicia in Natolia, with a harbour on the Levant Sea, a little to the north of Scanderoon. E. Long. 36. 25. N. Lat. 36. 56.

Near this place, in a difficult pass between the mountains and the sea, Alexander the Great fought his second battle with Darius. One great cause of the defeat which the Persians received here was the bad conduct of their monarch, who led his numerous forces into a narrow place, where they had not room to act. Alexander was so much surpris'd when he first received the news that Darius was behind him, that he could scarce believe it to be true: but when he was thoroughly satisfied of the fact, and that Darius had again pass'd the river Pinarus, he called a council of war, wherein, without asking any body's advice, he only told them, that he hoped they would remember their former actions; and that they,

who were always conquerors, were about to fight people who were always beat. He further observed, that Darius seem'd to be infatuated, since he had with such expedition quitted an open and champaign country, where his numbers might have acted with advantage, to fight in a place inclosed, where the Macedonian phalanx might be well drawn up, and where his numbers could only incommode him. He then made the necessary dispositions for repassing the mountains, posted guards where he found them necessary and then commanded his troops to refresh themselves, and to take their rest till morning.

At break of day he began to repass the mountains, obliging his forces to move in close order where the road was narrow, and to extend themselves as they had more room; the right wing keeping always close to the mountain, and the left to the sea-shore. On the right there was a battalion of heavy-armed troops, besides the targeteers under the command of Nicanor the son of Parmenio. Next these, extending to the phalanx, were the corps of Cœnus and Perdicas; and on the left, the respective bodies commanded by Amyntas, Ptolemy, and Meleager. The foot appointed to support them were commanded by Craterus; but the whole left wing was committed to Parmenio, with strict orders not to decline from the sea-shore, lest the Persians should surround them. Darius ordered 20,000 foot and 30,000 horse to retire, finding that he already wanted room to draw up the rest. His first line consisted of 30,000 Greek mercenaries, having on their right and left 60,000 heavy-armed troops, being the utmost the ground would allow. On the left, towards the mountain, he posted 20,000 men, which, from the hollow situation of the place, were brought quite behind Alexander's right wing. The rest of his troops were formed into close and useless lines behind the Greek mercenaries, to the number in all of 600,000 men. When this was done, he suddenly recalled the horse who had retired, sending part of them to take post on his right against the Macedonians commanded by Parmenio; and the rest he ordered to the left towards the mountain: but, finding them unserviceable there, he sent the greatest part of them to the right; and then took upon himself, according to the custom of the Persian kings, the command of the main body. As soon as Alexander perceived that the weight of the Persian horse was disposed against his left wing, he dispatched, with as much secrecy as he could, the Thessalian cavalry thither, and supplied their places on the right by some brigades of horse from the van, and light-armed troops. He also made such dispositions, that, notwithstanding the mighty advantage of the hollow mountain, the Persians could not surround him. But, as these precautions had considerably weakened the centre of his army, he ordered those advanced posts on the enemy's left, of which he was most apprehensive, to be attacked at the very beginning of the fight; and, when they were easily driven from them, he recalled as many troops as were necessary to strengthen his centre.

When all things were in order, Alexander gave strict command, that his army should march very slowly. As for Darius, he kept his troops fixed in their posts, and in some places threw up ramparts; whence the

Iffus.

Macedonians rightly observed, that he thought himself already a prisoner. Alexander at the head of the right wing engaged first, and without any difficulty broke and defeated the left wing of Darius. But, endeavouring to pass the river Pinarus after them, his troops in some measure losing their order, the Greek mercenaries fell upon them in flank, and made them fight, not only for victory, but for their lives. Ptolemy the son of Seleucus, and 120 Macedonians of some rank, were killed upon the spot. But the foot next to Alexander's right wing coming in seasonably to its relief, fell upon the mercenaries in flank, amongst whom a dreadful carnage was made; they being in a manner surrounded by the horse and light-armed troops, which at first pursued the left wing, and the foot that now passed the river. The Persian horse on the right still fought gallantly; but, when they were thoroughly informed of the rout of their left wing and of the destruction of the Greek mercenaries, and that Darius himself was fled, they began to break, and betake themselves to flight also. The Thessalian cavalry pursued them close at the heels; and the narrow craggy roads incommoded them exceedingly, so that vast numbers of them perished. As for Darius, he fled, soon after the left wing was broken, in a chariot with a few of his favourites: as far as the country was plain and open, he escaped well enough; but, when the roads became rocky and narrow, he quitted it, and, mounting a horse, rode all the night: his chariot, in which were his cloak and his bow, fell into the hands of Alexander, who carried them back to his camp.

In respect to the battle of Iffus, Diodorus informs us, that Alexander looked every where about for Darius; and, as soon as he discovered him, with his handful of guards attacked him and the flower of the Persian army which was about him; being as desirous of obtaining this victory by his personal valour, as of subduing the Persian empire by the courage of his soldiers. But when Oxathres, the brother of Darius, saw Alexander's design, and how fiercely he sought to accomplish it, he threw himself, with the horse who were about him, between his brother's chariot and the enemy, where an obstinate fight was maintained, till the dead bodies rose like an entrenchment about the chariot of Darius. Many of the Persian nobility were slain, and Alexander himself was wounded in the thigh. At last, the horses in the chariot of Darius started, and became so unruly, that the king himself was forced to take the reins; the enemy, however, pressed so hard upon him, that he was constrained to call for another chariot, and mounted it in great danger. This was the beginning of the rout, which soon after became general. According to this author, the Persians lost 200,000 foot, and 10,000 horse; the Macedonians 300 foot, and 150 horse.

Justin informs us, that the Persian army consisted of 400,000 foot, and 100,000 horse. He says, that the battle was hard fought; that both the kings were wounded; and that the Persians still fought gallantly when their king fled, but that they were afterwards speedily and totally routed: he is very particular as to their loss, which he says amounted to 61,000 foot, 10,000 horse, and 40,000 taken prisoners; of the Macedonians he says there fell no more than 130 foot, and

150 horse. Curtius says, that of the Persians there fell 100,000 foot, and 10,000 horse: of Alexander's army 504, he says, were wounded; 32 foot and 150 horse killed. That we may not suspect any error in transcribers, his own observation confirms the fact: *Tantulo impendio ingens victoria fletit*, "So small was the cost of so great a victory."

ISTHMA, or *ISTHMIAN Games*; one of the four solemn games which were celebrated every fifth year in Greece. They had the name from the Isthmus of Corinth, where they were celebrated. In their first institution, according to Pausanias, they consisted only of funeral rites and ceremonies in honour of Melicertes: but Theseus afterwards, as Plutarch informs us, in emulation of Hercules, who had appointed games at Olympia in honour of Jupiter, dedicated those to Neptune, his reputed father, who was regarded as the particular protector of the Isthmus and commerce of Corinth. The same trials of skill were exhibited here as at the other three sacred games; and particularly those of music and poetry. These games, in which the victors were only rewarded with garlands of pine-leaves, were celebrated with great magnificence and splendor as long as paganism continued to be the established religion of Greece; nor were they omitted even when Corinth was sacked and burnt by Mummius the Roman general; at which time the care of them was transferred to the Sicyonians, but was restored again to the Corinthians when their city was rebuilt.

ISTHMUS, a narrow neck, or slip of ground, which joins two continents; or joins a peninsula to the terra firma, and separates two seas. See PENINSULA.

The most celebrated isthmuses are, that of Panama or Darien, which joins North and South America; that of Suez, which connects Asia and Africa; that of Coriath, or Peloponnesus, in the Morea; that of Crim-Tartary, otherwise called *Taurica Chersonesus*; that of the peninsula Romania, and Erizzo, or the isthmus of the Thracian Chersonesus, twelve furlongs broad, being that which Xerxes undertook to cut through. The ancients had several designs of cutting the isthmus of Corinth, which is a rocky hillock, about ten miles over; but they were all in vain, the invention of sluices being not then known. There have been attempts too for cutting the isthmus of Suez, to make a communication between the Red Sea and the Mediterranean: but these also failed; and in one of them, a king of Egypt is said to have lost 120,000 men.

ISTRIA, a peninsula of Italy, in the territory of Venice, lying in the north part of the Adriatic sea. It is bounded by Carniola on the north; and on the south, east, and west, by the sea. The air is unwholesome, especially near the coast; but the soil produces plenty of wine, oil, and pastures; there are also quarries of fine marble. One part of it belongs to the Venetians, and the other to the house of Austria. Cabo d'Istria is the capital town.

ITALIAN, the language spoken in Italy. See the article LANGUAGE.

This tongue is derived principally from the Latin; and of all the languages formed from the Latin, there is

none

MEDITERRANEAN SEA

alian none which carries with it more visible marks of its original than the Italian.

It is accounted one of the most perfect among the modern tongues. It is complained, indeed, that it has too many diminutives and superlatives, or rather augmentatives; but without any great reason: for if those words convey nothing farther to the mind than the just ideas of things, they are no more faulty than our pleonasm and hyperboles.

The language corresponds to the genius of the people, who are slow and thoughtful: accordingly, their language runs heavily, though smoothly; and many of their words are lengthened out to a great degree. They have a great taste for music; and to gratify their passion this way, have altered abundance of their primitive words; leaving out consonants, taking in vowels, softening and lengthening out their terminations, for the sake of the cadence.

Hence the language is rendered extremely musical, and succeeds better than any other in operas and some parts of poetry: but it fails in strength and nervousness; and a great part of its words, borrowed from the Latin, become so far disguised, that they are not easily known again.

The multitude of sovereign states into which Italy is divided, has given rise to a great number of different dialects in that language; which, however, are all good in the place where they are used. The Tuscan is usually preferred to the other dialects, and the Roman pronunciation to that of the other cities; whence the Italian proverb, *Lingua Toscana in bocca Romana*.

The Italian is generally pretty well understood throughout Europe; and is frequently spoken in Germany, Poland, and Hungary. At Constantinople in Greece, and in the ports of the Levant, the Italian is used as commonly as the language of the country: indeed in those places it is not spoken so pure as in Tuscany, but is corrupted with many of the proper words and idioms of the place; whence it takes a new name, and is called *Frank Italian*.

ITALIC CHARACTER, in printing. See LETTER.

ITALICA (anc. geog.), a town of Baetica in Spain, built by Scipio Africanus, after finishing the Spanish war, for the reception of the wounded soldiers. At first it was a municipium; afterwards a colony: which was a matter of wonder to the emperor Adrian, the privileges of a municipium being beyond those of a colony (Gellius). Famous for being the birth-place of the emperors Trajan and Adrian, and of the poet Silius Italicus. Now *Sevilla Vieja*, scarce four miles from Seville; a small village of Andalusia on the Guadalquivir.—*Corfinium* in Italy was thus also called.

ITALY, one of the finest countries of Europe, lying between 7 and 10 degrees of E. Long. and between 37 and 46 degrees of N. Lat. On the north, north-west, and north-east, it is bounded by France, Switzerland, the country of the Grisons, and Germany; on the east, by the Adriatic sea or gulf of Venice; and on the south and west, by the Mediterranean; its figure bearing some resemblance to that of a boot. Its length from Aosta, at the foot of the Alps in Savoy, to the utmost verge of Calabria, is about 600 miles; but its breadth is very unequal,

being in some places near 400 miles, in others not above 25 or 30.

Italy was anciently known by the names of *Saturnia*, *Oenotria*, *Hesperia*, and *Aufonia*. It was called *Saturnia* from Saturn; who, being driven out of Crete by his son Jupiter, is supposed to have taken refuge here. The names of *Oenotria* and *Aufonia*, is borrowed from its ancient inhabitants the Oenotrians and Aufones; and that of *Hesperia* or *Western* was given it by the Greeks, from its situation with respect to Greece. The names of *Italia* or *Italy*, which in process of time prevailed over all the rest, is by some derived from *Italus*, a king of the Siculi: by others, from the Greek word *Italos*, signifying an ox; this country abounding, by reason of its rich pastures, with oxen of an extraordinary size and beauty. All these names were originally peculiar to particular provinces of Italy, but afterwards applied to the whole country.

This country, like most others, was in ancient times divided into a great number of petty states and kingdoms. Afterwards when the Gauls settled in the western, and many Greek colonies in the eastern parts, it was divided, with respect to its inhabitants, into three great parts, *viz.* Gallia Cisalpina, *Italy* properly so called, and Magna Grecia. The most western and northern parts of Italy were in great part possessed by the Gauls; and hence took the name of *Gallia*, with the epithets of *Cisalpina* and *Citerior*, because they lay on the side of the Alps next to Rome; and *Togata*, with relation to the Roman gown or dress which the inhabitants used: but this last epithet is of a much later date than the former. This appellation was antiquated in the reign of Augustus, when the division of Italy into eleven provinces, introduced by that prince, took place. Hence it is that the name of *Cisalpine Gaul* frequently occurs in the authors who flourished before, and scarce ever in those who wrote after, the reign of Augustus. This country extended from the Alps and the river Varus, parting it from Transalpine Gaul, to the river Aefus; or, as Pliny will have it, to the city of Ancona, in the ancient Picenum. On the north, it was divided from Rhaetia by the Alps, called *Alpes Rhaeticae*; and from Illyricum by the river Formio: but on this side, the borders of Italy were, in Pliny's time, extended to the river Arsa in Iliria. On the south, it reached to the Ligulic sea, and the Apennines parting it from Etruria; so that under the common name of *Cisalpine Gaul* were comprehended the countries lying at the foot of the Alps, called by Pliny and Strabo the *Subalpine countries*, Liguria, Gallia Cispadana, and Transpadana, *Italy*, properly so called, extended, on the coast of the Adriatic, from the city of Ancona to the river Trento, now the Fortore; and on the Mediterranean, from the Macra to the Silarus, now the Sele. Magna Grecia comprised Apulia, Lucania, and the country of the Brutii. It was called *Greece*, because most of the cities on the coast were Greek colonies. The inhabitants gave it the name of *Great*, not as if it was larger than Greece, but merely out of ostentation, as Pliny informs us.

All these countries were inhabited by a great number of different nations settled at different times, and from many different parts. The names of the most remarkable

remakable of them were the *Aborigines*, or those whose origin was utterly unknown, and consequently were thought to have none; the *Sabines*, *Ettrurians* or *Tuscans*, the *Umbri*, *Sannites*, *Campani*, *Apulii*, *Calabrii*, *Lucanii*, the *Brutii*, and the *Latins*. From a colony of the latter proceeded the Romans, who gradually subdued all these nations one after another, and held them in subjection for upwards of 700 years. All these nations were originally brave, hardy, temperate, and well skilled in the art of war; and the Romans much more so than the rest. Their subjection to Rome, however, inured them to slavery; their oppression by the emperors broke their spirit; and the vast wealth which was poured into the country from all parts of the world, during the time of the Roman prosperity, corrupted their manners, and made them degenerate from their former valour. Of this degeneracy the barbarous nations of the north took the advantage to invade the empire in innumerable multitudes. Though often repelled, they never failed to return; and it was found necessary to take great numbers of them into the Roman service, in order to defend the empire against the rest of their countrymen. In the year 476, the *Heruli*, presuming on the services they had done the empire, demanded a third part of the lands of Italy; and being refused, chose one Odoacer, a man of low birth, but of great valour and experience, for their king; and having totally destroyed the remains of the Roman empire, proclaimed Odoacer king of Italy. The new monarch, however, did not think proper to alter the Roman form of government, but suffered the people to be governed by the senate, consuls, &c. as before. He enjoyed his dignity in peace till the year 488, when *Zeno*, emperor of Constantinople, being hard pressed by *Theodoric* king of the *Ostrogoths*, advised him to turn his arms against Odoacer, whom he could easily overcome, and thus make himself sovereign of one of the finest countries in the world.

scended.

*Theodoric* accepted the proposal with great joy, and set out for Italy, attended by an infinite number of people, carrying with them their wives, children, and effects, on waggons. Several Romans of great distinction attended him in this war; while, on the other hand, many of his countrymen chose to remain in *Thrace*, where they became a separate nation, and lived for a long time in amity with the Romans. The *Goths*, being destitute of shipping, were obliged to go round the *Adriatic*. Their march was performed in the depth of winter; and during the whole time, a violent famine and plague raged in their army. They were also opposed by the *Gepidæ* and *Sarmatians*; but at last having defeated these enemies, and overcome every other obstacle, they arrived in Italy in the year 489. *Theodoric* advanced to the river *Sontius*, now *Zonzo*, near *Aquileia*, where he halted for some time to refresh his troops. Here he was met by *Odoacer* at the head of a very numerous army, but composed of many different nations commanded by their respective chiefs, and consequently without sufficient union or zeal for the common cause. *Theodoric* therefore gained an easy victory, cut many of his enemies in pieces, and took their camp. *Odoacer* retired to the plains of *Verona*, and encamped there at a small distance from the city; but *Theodoric* pursued him close,

and soon forced him to a second engagement. The *Goths* obtained another victory; but it cost them dear. *Odoacer's* men made a much better resistance than before, and great numbers fell on both sides. The victory, however, was so far decisive, that *Odoacer* was obliged to shut himself up in *Ravenna*; so that *Theodoric* having now no enemy to oppose him in the field, besieged and took several important places, and among the rest *Milan* and *Pavia*. At the same time, *Tufa*, commander in chief of *Odoacer's* forces, deserted to the enemy with the greatest part of the troops he had with him, and was immediately employed in conjunction with a Gothic officer in pursuit of his sovereign. *Odoacer* had left that city, and was advanced as far as *Faenza*, where he was closely besieged by *Tufa*; but the traitor, declaring again for his old master, joined him with all his troops, and delivered up several officers that had been appointed by *Theodoric* to serve under him. These were sent in irons to *Ravenna*; and *Odoacer* being joined by *Frideric*, one of *Theodoric's* allies, with a considerable body of troops, once more advanced against his enemies. He recovered all *Liguria*, took the city of *Milan*, and at last besieged *Theodoric* himself in *Pavia*. The *Goths*, having brought all their families and effects along with them, were greatly distressed for want of room; and must have undoubtedly submitted, if their enemies had continued to agree among themselves. The quarrels of his followers proved the ruin of *Odoacer*. *Theodoric*, finding that the enemy remitted the vigour of their operations, applied for succours to *Alaric* king of the *Visigoths*, who had settled in *Gaul*. As the *Visigoths* and *Ostrogoths* were originally one and the same nation, and the *Visigoths* had received among them some years before a great number of *Ostrogoths* under the conduct of *Videmer* cousin-german to *Theodoric*, the supplies were readily granted. The inaction of the enemy gave these succours time to arrive; upon which *Theodoric* instantly joined them, and marching against his enemies gave them a total overthrow. *Odoacer* again took refuge in *Ravenna*, but was closely besieged by *Theodoric* in 490. The siege lasted three years; during which *Odoacer* defended himself with great bravery, and greatly annoyed the besiegers with his sallies. *Theodoric*, however, impatient of delay, leaving part of his army to blockade the city, marched with the rest against the strong holds which *Odoacer* had garrisoned. All these he reduced with little difficulty; and in 492 returned to the siege of *Ravenna*. The besieged were now reduced to great straits both by the enemy without and a famine within, the price of wheat being risen to six pieces of gold per bushel. On the other hand, the *Goths* were quite worn out with the fatigues of such a long siege; so that both parties being willing to put an end to the war, *Odoacer* sent *John* bishop of *Ravenna* to *Theodoric* with terms of accommodation. *Jornandes* informs us, that *Odoacer* only begged his life; which *Theodoric* bound himself, by a solemn oath, to grant him: but *Procopius* says, that they agreed to live together on equal terms. This last seems very improbable: but whatever were the terms of the agreement, it is certain that *Theodoric* did not keep them; for having a few days after invited *Odoacer* to a banquet, he dispatched him with his own hand.

Italy.

y. hand. All his servants and relations were massacred at the same time; except his brother Arnulphus, and a few more, who had the good luck to make their escape, and retired beyond the Danube.

Thus Theodoric became master of all Italy, and took upon himself the title of *king* of that country, as Odoacer had done before; though, with a pretended deference to the emperor of Constantinople, he sent messengers asking liberty to assume that title after he had actually taken it. Having secured his new kingdom as well as he could by foreign alliances, Theodoric next applied himself to legislation, and enacted many salutary laws besides those of the Romans which he retained. He chose Ravenna for the place of his residence, in order to be near at hand to put a stop to the incursions of the barbarians. The provinces were governed by the same magistrates that had presided over them in the times of the emperors, *viz.* the *consulares*, *correctores*, and *praefides*. But besides these, he sent, according to the custom of the Goths, inferior judges, distinguished by the name of *counts*, to each city. These were to administer justice, and to decide all controversies and disputes. And herein the polity of the Goths far excelled that of the Romans. For in the Roman times a whole province was governed by a *consularis*, a *corrector*, or a *praefes*, who resided in the chief city, and to whom recourse was to be had at a great charge from the most remote parts: but Theodoric, besides these officers, appointed not only in the principal cities, but in every small town and village, inferior magistrates of known integrity, who were to administer justice, and by that means save those who had law-suits the trouble and expence of recurring to the governor of the whole province; no appeals to distant tribunals being allowed, but in matters of the greatest importance, or in cases of manifest injustice.

Under the administration of Theodoric Italy enjoyed as great happiness as had been experienced under the very best emperors. As he had made no alteration in the laws except that above mentioned; so he contented himself with the same tributes and taxes that had been levied by the emperors; but was, on all occasions of public calamity, much more ready to remit them than most of the emperors had been. He did not treat the natives as those of the other Roman provinces were treated by the barbarians who conquered them. These stripped the ancient proprietors of their lands, estates, and possessions, dividing them among their chiefs; and giving to one a province with the title of *duke*, to another a frontier country with the title of *marquis*; to some a city with the title of *count* to others a castle or village with the title of *baron*. But Theodoric, who piqued himself upon governing after the Roman manner, and observing the Roman laws and institutions, left every one in the full enjoyment of his ancient property. As to religion, though he himself, like most of his countrymen, professed the tenets of Arius, he allowed his subjects to profess the orthodox doctrine without molestation, giving liberty even to the Goths to renounce the doctrines in which they had been educated, and embrace the contrary opinions. In short, his many virtues, and the happiness of his subjects, are celebrated by all the historians of those times. The end of his reign, however, was sullied by

the death of the celebrated philosopher Boethius, and his father-in-law Symmachus. They were both beheaded in Pavia, on an unjust suspicion of treason; and scarce was the sentence put in execution when the king repented, and abandoned himself to the most pungent sorrow. The excess of his grief affected his understanding: for not long after, the head of a large fish being served up to supper, he fancied the head of the fish to be that of Symmachus threatening him in a ghastly manner. Hercupon, seized with horror and amazement, he was carried to his bed-chamber, where he died in a few days, on the 2d of September 526.

After the death of Theodoric, the kingdom devolved to Athalric his grandson; who being at that time only eight years of age, his mother Amalafuntha took upon her the regency. Her administration was equally upright with that of Theodoric himself; but the barbarians of whom her court was composed, finding fault with the encouragement she gave to learning, forced her to abandon the education of her son. The latter thereupon plunged into all manner of wickedness, and behaved to his mother with the greatest arrogance; and the faction finding themselves thus strengthened, at last commanded the queen to retire from court.

Amalafuntha, exerting her authority, seized three of the ringleaders of the sedition, whom she confined in the most remote parts of Italy. But these maintaining a secret correspondence with their friends and relations, never ceased to stir up the people against her; insomuch, that the queen, apprehending that the faction might in the end prevail, wrote to the emperor Justinian, begging leave to take refuge in his dominions. The emperor readily complied with her request, offering a noble palace at Durazzo for her habitation; but the queen having in the mean time caused the three ringleaders to be put to death, and no new disturbances arising thereupon, she did not accept of the emperor's offer. In 533, Athalric having contracted a lingering distemper by his riotous living and debaucheries, Amalafuntha, to avoid the calamities with which Italy was threatened in case of his death, formed a design of delivering it up to Justinian: but before her scheme was ripe for execution, Athalric died. Upon which the queen took for her colleague one Theodotus her cousin; obliging him, however, to swear that he would suffer her to enjoy and exercise her former power. This he very readily did, but soon forgot his promise; and when she took the liberty to remind him of it, caused her to be seized and confined in an island of the lake Bolsena in Tuscany. But as Theodotus had great reason to believe that this conduct would be resented by Justinian, he obliged her to write to him that no injury or injustice had been done her. Along with this letter he sent one written by himself, and filled with heavy complaints against Amalafuntha. The emperor, however, was so far from giving credit to what Theodotus urged against her, that he openly espoused her cause, wrote her a most affectionate letter, and assured her of his protection. But before this letter could reach her, the unhappy princess was strangled in the bath by the friends of those whom in the reign of her son she had deservedly put to death for raising disturbances in the state.

On the news of Amalafuntha's death, Justinian resolved

solved upon an immediate war with the Goths; and, to facilitate the enterprize, used his utmost endeavours to induce the Franks to assist him. To his solicitations he added a large sum of money; which last was very acceptable to his new allies. They promised to assist the emperor to the utmost of their power; but instead of performing their promise, while Justinian's arms were employed against the Goths, Thierry, the eldest son of Clovis, seized on several cities of Liguria, the Alps Cottia, and great part of the present territory of Venice, for himself. Justinian, however, found sufficient resources in the valour of Belisarius, notwithstanding the defection of his treacherous allies. This celebrated general was vested with the supreme command, and absolute authority. His instructions were to pretend a voyage to Carthage, but to make an attempt upon Sicily; and if he thought he could succeed in the attempt, to land there; otherwise to sail for Africa, without discovering his intentions. Another general, named *Mundus*, commander of the troops in Illyricum, was ordered to march into Dalmatia, which was subject to the Goths, and attempt the reduction of Salonæ, the better to open a passage into Italy. This he accomplished without difficulty, and Belisarius made himself master of Sicily sooner than he himself had expected. The island was reduced on the last of December 535; upon which Belisarius, without loss of time, passed over to Reggio, which opened its gates to him. From Reggio he pursued his march to Rome, the provinces of Abrutium, Lucania, Puglia, Calabria, and Samnium, readily submitting to him. The city of Naples endured a siege: but Belisarius entered in through an aqueduct, and gave it up to be plundered by his soldiers.

Theodotus, alarmed at these successes, and having neither capacity nor inclination to carry on the war, sent ambassadors to Justinian with proposals of peace. He agreed to renounce all pretensions to the island of Sicily; to send the emperor yearly a crown of gold weighing 300 pounds; and to supply him with 3000 men whenever he should think proper to demand them. Several other articles were contained in the proposal, which amounted to the owning of Justinian for his lord, and that he held the crown of Italy only through his favour. As he apprehended, however, that these offers might not yet be satisfactory, he recalled his ambassadors for further orders. They were now desired to inform Justinian, that Theodotus was willing to resign the kingdom to him, and content himself with a pension suitable to his quality. But he obliged them by an oath not to mention this proposal, till they found that the emperor would not accept of the offer. The first proposals were accordingly rejected as they had supposed; upon which the ambassadors produced the second, signed by Theodotus himself, who in his letter to the emperor told him, among other things, that being unacquainted with war, and addicted to the study of philosophy, he preferred his quiet to a kingdom. Justinian, transported with joy, and imagining the war already finished, answered the king in a most obliging manner, extolling his wisdom, and giving him besides what he demanded the greatest honours of the empire. The agreement being confirmed by mutual oaths, lands were assigned to Theodotus out of the king's domain, and orders were dis-

Nº 170.

patched to Belisarius to take possession of Italy in his name.

In the mean time, a body of Goths having entered Dalmatia, with a design to recover the city of Salonæ, were encountered by an inferior army of Romans, commanded by the son of Mundus above mentioned. The Goths proved victorious; and the young general of the Romans was killed, and most of his army cut in pieces. Mundus marched against the enemy to revenge the death of his son; but met with no better success, his troops being defeated, and he himself killed in the engagement. Upon this the Romans abandoned Salonæ and all Dalmatia; and Theodotus, elated with his success, refused to fulfil the articles of the treaty. Justinian dispatched Constantianus, an officer of great valour and experience, into Illyricum, with orders to raise forces there, and to enter Dalmatia; at the same time he wrote to Belisarius to pursue the war with the utmost vigour.

The Goths were now reduced to the greatest straits. Constantianus drove them out of Dalmatia; and Belisarius having reduced all the provinces which compose the present kingdom of Naples, advanced towards Rome. The chief men of the nation, finding their king incapable of preventing the impending ruin, assembled without his consent, and dispatched ambassadors to Belisarius with proposals of peace. These proposals were rejected; and Belisarius returned for answer, that he would hearken to no terms, nor sheath his sword, till Italy was reannexed to the empire to which it belonged. The Goths finding Theodotus still inactive, unanimously deposed him; and chose in his stead one Vitiges, a man of great valour, but of a mean descent. Theodotus fled to Ravenna; but the new king dispatched after him a messenger, who soon overtook him and cut off his head.

Vitiges began his government by writing a circular letter, in which he exhorted his countrymen to exert their ancient courage, and fight bravely for their lives and liberties. He then marched with what forces he could collect towards Rome; but not thinking himself able to defend that city against the Roman forces, he abandoned it to Belisarius, and arriving at Ravenna was joined by the Goths from all parts, so that he soon found himself at the head of a considerable army. Belisarius in the mean time entered Rome without opposition, on the 9th or 10th of December 537. The Gothic garrison retired by the Porta Flaminia, while Belisarius entered by the Porta Asinaria. Leudaris, governor of the city, who staid behind, was sent, together with the keys, to the emperor. Belisarius immediately applied himself to the repairing of the walls and other fortifications; filled the granaries with corn, which he caused to be brought from Sicily; and stored the place with provisions, as if he had been preparing for a siege; which gave no small uneasiness to the inhabitants, who chose rather that their city should lie open to every invader, than that they should be liable to the calamities of a siege. While Belisarius was thus employed at Rome, the city of Benevento, with great part of the territory of Samnium, was delivered up to him: at the same time the cities of Narnia, Spoleto, and Perugia, revolting from the Goths, received Roman garrisons; as did most of the cities of Tuscany.

ly. In the mean time, Vitiges having collected an army of 150,000 men, resolved to march directly to Rome, and engage Belisarius; or, if he declined an engagement, to lay siege to the city. But apprehending that the Franks, who were in confederacy with the emperor, might fall upon him at the same time, he sent ambassadors to them, with offers of all the Gothic possessions in Gaul, besides a considerable sum of money, provided they joined him against the emperor. The Franks with their usual treachery consented to the proposal, received the money and the territories agreed on, and then refused to fulfil the terms of the treaty. Vitiges, however, began his march to Rome, leaving behind him all the fortified towns on the road, the reduction of which he knew would cost him too much trouble. Belisarius, whose army, reduced by the many towns he had garrisoned, did not now amount to above 5000 men, dispatched messengers to Constantianus in Tuscany; and to Bessas, by nation a Goth, but of the emperor's party, in Umbria, with orders to join him with all possible expedition; writing at the same time to the emperor himself for supplies in the most pressing manner. Constantianus joined him pursuant to his orders; and soon after, Bessas, falling in with part of the enemy's vanguard, killed a considerable number of them, and put the rest to flight. Belisarius had built a fort upon a bridge about a mile from Rome, and placed a strong garrison in it to dispute the passage with the enemy; but the garrison, seized with a panic at the approach of the Goths, abandoned their post in the night, and fled into Campania. Early in the morning Vitiges passed over great part of his army, and marched on till he was met by Belisarius, who, knowing nothing of what had happened, came with 1000 horse to view the ground about the bridge. He was greatly surprised when he beheld the enemy marching up against him: however, lest he should heighten their courage by his flight or retreat, he stood his ground, and received the enemy at the head of his small body, exposing himself, without his usual prudence and discretion, to the greatest dangers. Being known by some fugitives, and discovered to the enemy, they all aimed at him alone, which made his own men the more solicitous to defend him; so that the whole contest was for some time about his person. At last the Goths were driven back to their camp, which the Romans with great temerity attempted to force. In this attempt, however, they met with such a vigorous resistance, that they soon abandoned the enterprise, and retired with precipitation to a neighbouring eminence; whence they were forced down by the enemy, put to flight, and pursued to the very gates of the city. Here they were in greater danger than ever; for those within, fearing that the enemy might in that confusion enter with them, refused to admit them. The general himself cried out earnestly to them, telling who he was, and commanding them to open the gates; but as they had been informed by those who first fled, that he was slain, and they could not distinguish him on account of the blood and dust with which his face was covered, they gave no ear to what he said. In this extremity, having encouraged his men, who were now driven into a narrow compass, to make a last effort, he put himself at their head, and

attacked the enemy with such fury, that the Goths, imagining fresh troops were falling out upon them, began to give ground, and at last retired to their camp. The Roman general did not pursue them; but entered the city, where he was received with loud acclamations.

Italy.

A few days after, the city was closely invested by Vitiges; who, to distress the inhabitants, pulled down the aqueducts by which water was conveyed into the city, and which had been built at an immense charge by the Roman emperors. Belisarius on his part omitted nothing for his defence; inasmuch that the cowardly citizens assembled in a tumultuous manner, and railed at the general on account of his supposed temerity. Vitiges, to encourage this mutinous disposition, dispatched ambassadors to the senate with proposals of peace. These ambassadors, however, were dismissed without any answer, and the siege was begun with great vigour. Belisarius made a gallant defence; and in seven months is said to have destroyed 40,000 of the Goths. About this time he received a supply of 1600 archers from the emperor; and these, in several successful sallies, are said to have killed 4000 more of the enemy.

18  
Rome besieged by the Goths.

The Romans, elated with their successes, now became impatient for an engagement; and at last, notwithstanding all the remonstrances of their general, forced him to lead them out against the enemy. The success was answerable to the rash attempt. The Romans were defeated, with the loss of some of their bravest officers, and a great many of their common soldiers; after which they contented themselves with falling out in small parties, which they commonly did with the greatest success.

But though the Romans had the satisfaction of thus cutting off their enemies, they were most grievously afflicted with a famine and plague; inasmuch that the inhabitants, no longer able to bear their calamities, were on the point of forcing Belisarius to venture a second battle, when a seasonable supply of troops, viz. 3000 Isaurians, 800 Thracian horse, and 1300 horse of other nations, together with 500 Italians who joined them by the way, arrived at Rome. Belisarius immediately sallied out by the Flaminian gate, and fell upon the Goths in order to give his allies time to enter by the opposite side of the city, which they did without the loss of a man.—The Goths hearing of the arrival of these troops, and their numbers being magnified as is usual in such cases, began to despair of becoming masters of the city; especially as the famine and plague raged with great violence in their camp, and their army was much reduced. Ambassadors were therefore dispatched to Belisarius with proposals of peace; but the only thing they could obtain was a cessation of arms for three months, during which time they might send ambassadors to the emperor. The negotiations with the emperor, however, proved unsuccessful; and the siege was pursued with great vigour till Vitiges received the news of the taking of Rimini by the Romans. As this city was but a day's journey from Ravenna, the Goths were so much alarmed, that they immediately raised the siege of Rome, after it had continued a year and nine days. Belisarius fell upon their rear as they passed the bridge of the Tiber, and

Italy.  
19  
The siege  
raised.

cut great numbers of them in pieces, while others, struck with a panic, threw themselves into the river and were drowned.

The first enterprise of Vitiges, after raising the siege of Rome, was an attempt upon Rimini: but while he was employed in this siege, the Romans made themselves masters of Milan; upon which a Gothic general, named *Uraia*, was immediately dispatched with a powerful army to retake it. In the mean time, however, a supply of 7000 Romans arrived from the emperor, under the command of Narfes, a celebrated general. The immediate consequence of this was the raising of the siege of Rimini; for Vitiges perceiving the two Roman armies coming against him, and concluding, from the many fires they made, that they were much more numerous than they really were, fled in such haste, that the greatest part of the baggage was left behind. The confusion of the Goths was so great, that, had not the garrison been extremely feeble, they might have easily cut them off in their retreat, and thus put an end to the war at once. The success of the Romans, however, was now retarded by some misunderstandings between the two generals: so that, though Belisarius made himself master of Urbinum and Urbiventum, while Narfes reduced some other places, yet the important city of Milan was suffered to fall into the hands of the Goths, who massacred all the inhabitants that were able to bear arms, to the number of 300,000, and sold the women for slaves. The city was also totally demolished; and this disaster made such an impression on the mind of Justinian, that he immediately recalled Narfes, and gave the command of his troops to Belisarius.

20  
Milan taken by the Goths.

Vitiges, who had promised himself great advantages from the disagreement of the two generals, was much disappointed by the recall of Narfes; and therefore dreading the power of Belisarius when at the head of a formidable army, thought of engaging in alliance with some foreign prince. In his choice, however, he was somewhat at a loss. He knew the treachery of the Franks, and therefore did not apply to them. He applied to the Lombards; but, though tempted by the offer of a large sum of money, they continued inviolably attached to the Roman interest. At last he found means to persuade Chosroes king of Persia to make war upon Justinian, which he thought would infallibly procure the recall of Belisarius. But the Roman general, understanding his design, pushed on the war in the most vigorous manner; while, in the mean time, the treacherous Franks, thinking both nations sufficiently weakened by their mutual hostilities, resolved to attack both, and seize upon the country for which they contended. Accordingly, Theodebert, unmindful of the oaths he had taken both to the Goths and Romans, passed the Alps at the head of 150,000, or, as some will have it, 200,000 men, and entered Liguria. As no hostilities were committed by them on their march, the Goths concluded that they were come to their assistance; and therefore took care to supply them with provisions. Thus they crossed the Po without opposition; and having secured the bridge, marched towards the place where a body of Goths were encamped; who, looking upon them as friends, admitted them without hesitation. But they were soon convinced of their mistake; for the Franks

21  
Italy invaded by the Franks.

falling unexpectedly upon them, drove them out of the camp with great slaughter, and seized on their baggage and provisions. A body of Romans that lay at a small distance from the Goths concluding that they had been defeated by Belisarius, advanced with great joy to meet *him* as they imagined; but the Franks falling unawares upon them, treated them as they had done the Goths, and made themselves masters of their camp. Thus they acquired a very considerable booty and store of provisions: but the latter being soon consumed, and the country round about quite exhausted, vast numbers of the Franks perished; so that Theodebert at last found himself obliged to return. In his way he destroyed Genoa and several other places, and arrived in his own dominions loaded with booty.

22  
Success of Belisarius.

In the mean time, Belisarius was making great progress. He took the cities of Auximum and Fesulæ after an obstinate siege; the inhabitants of the former having for some time sed on grass before they would surrender. After this he invested Ravenna, the capital of all the Gothic dominions in Italy. The place was defended by a very numerous garrison, commanded by the king in person, who exerted all his bravery in the defence of his metropolis. As the siege, however, was pushed on with great vigour, it was evident that the city must at last submit; and the great successes of the Romans began to give jealousy to the neighbouring potentates. Theodebert king of the Franks offered to assist Vitiges with an army of 500,000 men; but Belisarius, being informed of this negociation, sent ambassadors to Vitiges, putting him in mind of the treachery of the Franks, and assured him that the emperor was ready to grant him very honourable terms. The king, by the advice of his counsellors, rejected the alliance of the Franks, and sent ambassadors to Constantinople; but in the mean time, Belisarius, in order to bring the citizens to his own terms, bribed one of them to set fire to a magazine of corn, by which means the city was soon straitened for want of provisions. But, notwithstanding this disaster, they still continued to hold out, till the arrival of the ambassadors from Constantinople, who brought very favourable terms. These were, That the country beyond the Po, with respect to Rome, should remain to the Goths; but that the rest of Italy should be yielded to the emperor, and the royal treasure of the Goths should be equally divided between him and the king. To these conditions, however, Belisarius positively refused to assent; being desirous of leading captive the king of the Goths, as he had formerly done the king of the Vandals, to Constantinople. He therefore pursued the siege with more vigour than ever, without hearkening to the complaints of his soldiers and officers, who were quite tired out with the length of the siege: he only obliged such of the officers as were of opinion that the town could not be taken, to express their opinion in writing, that they might not deny it afterwards.

The Goths were as weary of the siege as the Romans; but fearing lest Justinian should transplant them to Thrace, formed a resolution, without the consent of their king, of surrendering to Belisarius himself, and declaring him emperor of the west. To this they were the more encouraged by the refusal of Belisarius to agree to the terms proposed by the emperor; whence

ly. whence they concluded that he designed to revolt, and make himself emperor of Italy. Of this, however, Belisarius had no design; but thought proper to accept of the title, in order to accelerate the surrender of the city, after acquainting his principal officers with what had passed. Vitiges at last discovered the plot; but hindring himself in no condition to oppose it, he commended the resolution of his people, and even wrote to Belisarius, encouraging him to take upon him the title of *king*, and assuring him of his assistance. Hereupon Belisarius pressed the Goths to surrender; which, however, they still refused, till he had taken an oath that he would treat them with humanity, and maintain them in the possession of all their rights and privileges. Upon this he was admitted into the city, where he behaved with great moderation towards the Goths; but seized on the royal treasure, and secured the person of the king. The Roman army, when it entered Ravenna, appeared so very inconsiderable, that the Gothic women on beholding it could not forbear spitting in the faces of their husbands, and reviling them as cowards.

The captivity of Vitiges, and the taking of Ravenna, did not put an end to the war. Belisarius was soon after recalled to take the command of the army in the east. The Goths were greatly surpris'd that he should leave his new kingdom out of regard to the orders of the emperor; but, after his departure, chose one Ildebal, a man of great experience in affairs both civil and military, for their king. He revived the drooping spirits of his countrymen, defeated the Romans, and reduced all the province of Venetia; but was in a short time murdered, and Eraric, a Rugian, succeeded to the throne. He was scarce invested with the sovereignty, when his subjects began to think of deposing him, and raising Totila to the throne; which the latter accepted, upon condition that they previously dispatched Eraric. This was accordingly done; after which Totila was proclaimed king of Italy in the year 542.

The new king proved a very formidable enemy to the Romans, who now lost ground every-where. They made an attempt on the city of Verona; in which they miscarried through their own avarice, having disputed about the division of the plunder till the opportunity of taking the town was past. They were next defeated in two bloody engagements; the consequence of which was, that the Goths made themselves masters of all the strong places in Iuseany. From thence marching into Campania and Samnium, they reduced the strong town of Beneventum, and laid siege to Naples. During the siege of this last place, several detachments were sent from the king's army, which took Cumæ, and recovered all Brutia, Lucania, Apulia, and Calabria, where they found considerable sums which had been gathered for the emperor's use. The Romans, in the mean time, disheartened by their losses, and deprived of those sums which should have paid their wages, refused to take the field. A considerable fleet was therefore sent by Justinian to the relief of Naples: but Totila, having timely notice of this design, manned, with incredible expedition, a great number of light vessels; which, falling unexpectedly on the Roman fleet, took or sunk every ship,

and made prisoners of all on board, excepting a few who escaped in their boats. A similar fate attended another fleet dispatched from Sicily for the same purpose. They put to sea in the depth of winter; and, meeting with a violent storm, were driven ashore near the enemy's camp; who sunk the ships, and made what slaughter they pleased of the seamen and soldiers. Upon this second disaster, the Neapolitans, despairing of further relief, submitted to Totila; who granted them honourable terms, and treated them with great humanity. As they had been long pinched with famine, Totila, apprehending they might endanger their lives by indulging their appetites too much at first, placed guards at the gates to prevent their going out, taking care at the same time to supply them sparingly with provisions, but increasing their allowance every day. Being thus by degrees restored to their former strength, he ordered the gates to be set open, and gave every one full liberty to stay in the city or remove as he thought fit. The garrison he treated with extraordinary kindness. They were full supplied with ships to carry them to Constantinople; but the king having discovered that their real design was to sail to Rome, in order to reinforce the garrison of that city (which they knew he was soon to besiege), he was so far from punishing them as they expected, that he furnished them with horses, waggons, and provisions, and ordered a body of Goths to escort them to Rome by land, as the winds had proved unfavourable for their passage by sea.

Totila having thus become master of Naples and most of the other fortresses in these parts, began to think of reducing Rome also. He first attempted to persuade the citizens to a surrender: but finding his persuasions ineffectual, he sent a detachment of his army into Calabria to reduce Otranto, which had not yet submitted; after which, he marched with the rest of his forces against the towns in the neighbourhood of Rome. The city of Tibur, now Tivoli, about 13 miles from Rome, was betrayed to him; and all the inhabitants, together with their bishop, were put to the sword. Several other strong-holds in the neighbourhood of that city he took by storm; so that Rome was in a manner blocked up by land, all communication with the neighbouring country being cut off.

Justinian, in the mean time, being greatly perplexed by the bad news he every day received from Italy, recalled Belisarius from Persia, notwithstanding the success which attended him there. To save Rome, however, was now impossible even for Belisarius himself. As soon as he arrived in Italy, finding himself unable either to relieve the towns which were besieged, or to stop the progress of the Goths, he dispatched letters to Justinian, informing him, that being destitute of men, arms, and money, it was impossible for him to prosecute the war; upon which the emperor ordered new levies to be made, all the veterans being engaged in the Persian war. In the mean time, however, Totila pursued his good fortune; took the cities of Firmum, Afeulum, Auximum, Spoletum, &c. and at length advanced to Rome, which he invited on all sides. As he drew near the city, two officers, whom Belisarius had sent into the city, ventured to make a false, though contrary to the express orders of their

Italy.

25  
Rome be-  
sieged,

Italy. general, thinking they should surprize the Goths; but they were themselves taken in an ambuscade, and, most of their men being cut in pieces, narrowly escaped falling into the hands of the enemy. Belisarius made several attempts to relieve the city: but all of them, however well concerted, by some accident or other proved unsuccessful; which gave him so much uneasiness, that he fell into a feverish disorder, and was for some time thought to be in danger of his life. The city was soon reduced to great straits; a dreadful famine ensued; and the unhappy citizens having consumed every thing that could be supposed to give them nourishment, even the grass that grew near the walls, were obliged, it is said, to feed on their own excrements. Many put an end to their lives, in order to free themselves from the intolerable calamities they suffered. The rest addressed their governor Bessas in the most pathetic manner, intreating him to supply them with food; or if that was not in his power, either to give them leave to go out of the town, or to terminate their miseries by putting them to death. Bessas replied, that to supply them with food was impossible; to let them go, unsafe; and to kill them, impious. In the end, however, he suffered those who were willing to retire, to leave the city, upon paying him a sum of money; but most of them either died on the road, or were cut in pieces by the enemy. At last, the besieged, unable to bear their miseries any longer, began to mutiny, and to press their governor to come to an agreement with Totila. This, however, he still refused; upon which, four of the Isaurians who guarded one of the gates, went privately to the camp of Totila, and offered to admit him into the city. The king received this proposal with great joy; and sending four Goths of great strength and intrepidity into the town along with them, he silently approached the gates in the nighttime with his whole army. The gates were opened by the Isaurians, as they had promised; and upon the first alarm, Bessas with most of the soldiers and officers fled out of the town. The inhabitants took sanctuary in the churches; and only 60 of them and 26 soldiers were killed after the town was taken. Totila, however, gave his soldiers full liberty to plunder the city: which they did for several days together, stripping the inhabitants of all their wealth, and leaving nothing in their houses but naked walls; by which means many persons of distinction were reduced to beg their bread from door to door. In the house of Bessas was found an immense treasure, which he had scandalously amassed during the siege, by selling to the people, at an exorbitant price, the corn which had been stored up for the use of the garrison.

Totila, thus become master of Italy, sent ambassadors to Justinian with very respectful letters, desiring to live on the same terms with him that Theodoric had done with his predecessor Anastasius; promising in that case to respect him as his father, and to assist him, when he pleased, with all his force, against any other nation whatever. On the contrary, if the emperor rejected his offers, he threatened to level Rome with the ground, to put the whole senate to the sword, and to carry the war into Illyricum. The emperor returned no other answer, than that he referred the whole to Belisarius, who had full power to manage all things of that nature. Upon this Totila resolved to destroy the city;

Italy. and had actually thrown down a third part of the wall, when he received a letter from Belisarius, dissuading him from his intention. After having seriously considered this letter, Totila thought proper to alter his resolution with regard to the destruction of the city; but sent every one of the inhabitants into Lucania, without leaving a single person in the metropolis. Belisarius hearing of this, immediately returned to the capital, and undertook to repeople and repair it. He cleared the ditch which had been filled by Totila, but was for the present obliged to fill up the breaches in the walls with stones loosely heaped upon one another; and in this situation the city was again attacked by the Goths. Belisarius, however, had taken care to supply the inhabitants with plenty of provisions, so that they were now in no danger of suffering by famine; and the assaults of the enemy were vigorously repelled, notwithstanding the bad situation of the fortifications, so that Totila at last abandoned the enterprize.

In the mean time the Persians gained great advantages over the Romans in the East, so that there was a necessity for recalling Belisarius a second time. He was no sooner gone, than Totila renewed his efforts with greater vigour than ever; and at the same time the Franks, concluding that both Romans and Goths would be much weakened by such a destructive war, seized upon Venetia, which belonged to both nations, and made it a province of the French empire. Totila did not oppose them; but having obtained a reinforcement of 6000 Lombards, returned immediately before Rome, fully intent on making himself master of that metropolis. Having closely invested it by sea and land, he hoped in a short time to reduce it by famine; but against this the governor wisely provided, by causing corn to be sown within the walls; so that he could probably have defied the power of Totila, had not the city been again betrayed by the Isaurians, who opened one of the gates and admitted the enemy.

Thus the empire of the Goths was a third time established in Italy; and Totila, immediately on his becoming master of Rome, dispatched ambassadors to Justinian, offering to assist him as a faithful ally against any nation whatever, provided he would allow him the quiet possession of Italy. But Justinian was so far from hearkening to this proposal, that he would not even admit the ambassadors into his presence; upon which Totila resolved to pursue the war with the utmost vigour, and to make himself master not only of those places which the Romans possessed in Italy, but in Sicily also. This he fully accomplished; when Narfes, who had formerly been joined in the command with Belisarius, was appointed general, with absolute and uncontrouled authority. But while this general was making the necessary preparations for his expedition, Totila, having equipped a fleet of 300 galleys, sent them to pillage the coasts of Greece, where they got an immense booty. They made a descent on the island of Corfu; and having laid it waste, they sailed to Epirus, where they surprized and plundered the cities of Nicopolis and Anchialus, taking many ships on the coast, among which were some laden with provisions for the army of Narfes. After these successes they laid siege to Ancona in Dalmatia. Being defeated, however, both by sea and land, Totila once more sent ambassadors to Constantinople, offering to yield Sicily

Sicily and all Dalmatia, to pay an annual tribute for Italy, and to assist the Romans as a faithful ally in all their wars; but Justinian, bent upon driving the Goths out of Italy, would not even suffer the ambassadors to appear in his presence.

Totila finding that no terms could be obtained, began to levy new forces, and to make great preparations by sea and land. He soon reduced the islands of Corsica and Sardinia; but this was the last of his successes. Narses arrived in Italy with a very formidable army, and an immense treasure to pay the troops their arrears, the want of which had been one great cause of the bad success of Belisarius in his last expedition. He immediately took the road to Rome; while Totila assembled all his forces, in order to decide the fate of Italy by a general engagement. The battle proved very oblique; but at last the Gothic cavalry being put to the rout, and retiring in great confusion among the infantry, the latter were thereby thrown into such disorder, that they could never afterwards rally. Narses, observing their confusion, encouraged his men to make a last effort; which the Goths not being able to withstand, betook themselves to flight, with the loss of 6000 men killed on the spot. Totila finding the day irrecoverably lost, fled with only five horsemen for his attendants; but was pursued and mortally wounded by a commander of one of the bodies of barbarians who followed Narses. He continued his flight, however, for some time longer; but was at last obliged to halt in order to get his wound dressed, soon after which he expired.

This disaster did not yet entirely break the spirit of the Goths. They chose for their king one Teia, deservedly esteemed one of the most valiant men of their nation, and who had on several occasions distinguished himself in a most eminent manner. All the valour and experience of Teia, however, were now insufficient to stop the progress of the Romans. Narses made himself master of a great number of cities, and of Rome itself, before the Goths could assemble their forces. The Roman general next proceeded to invest Cumæ; which Teia determined at all events to relieve, as the royal treasure was lodged in that city. This brought on an engagement, which, if Procopius is to be credited, proved one of the most bloody that ever was fought. The Roman army consisted of vast multitudes brought from different nations: the Goths were few in comparison; but, animated by despair, and knowing that all was at stake, they fought with the utmost fury. Their king placed himself in the first rank, to encourage his men by his example; and is said to have given such proofs of his valour and conduct as equalled him to the most renowned heroes of antiquity. The Romans discovering him, and knowing that his death would probably put an end to the battle, if not to the war itself, directed their whole force against him, some attacking him with spears, and others discharging against him showers of darts and arrows. Teia maintained his ground with great intrepidity, received the missile weapons on his shield, and killed a great number of the enemy with his own hand. When his shield was so loaded with darts that he could not easily wield it, he called for another. Thus he shifted his shield three times; but as he attempted to change it another time, his breast being

necessarily exposed for a moment, a dart struck him in that moment with such force, that he immediately fell down dead in the place where he had stood from the beginning of the battle, and upon heaps of the enemy whom he had killed. The Romans, seeing him fall, cut off his head and exposed it to the sight of the Goths, not doubting but they would be immediately disheartened and retire. In this, however, they were disappointed. The Goths maintained the fight with great vigour, till night put an end to the engagement. The next day the engagement was renewed early in the morning, and continued till night: but on the third day, the Goths despairing of being able to overcome an enemy so much superior to them in numbers, sent deputies to Narses, offering to lay down their arms, provided such of them as chose to remain in Italy were allowed to enjoy their estates and possessions without molestation, as subjects of the empire; and those who were willing to retire elsewhere, were suffered to carry with them all their goods and effects. To these terms Narses readily assented; and thus the empire of the Goths in Italy was finally destroyed, the country now becoming a province of the eastern Roman empire.

In this conquest Narses had been assisted, as already observed, by many barbarous nations, among whom were the Lombards, at that time settled in Pannonia. On the conclusion of the war, they were dismissed with rich presents, and the nation for some time continued faithful allies to the Romans. In the mean time Justinian dying, Narses, who governed Italy with an absolute sway, was accused to the emperor Justin II. and to the empress Sophia, of aspiring to the sovereignty of the country. Hereupon he was recalled, and Longinus sent to succeed him. As Narses was an eunuch, the empress is reported to have said, that his employment at Constantinople should be to distribute in the apartment of her women the portion of wool which each was to spin. Narses, enraged at this sarcasm, replied, that he should begin such a web as he should never be able to finish; and immediately dispatched messengers to Alboinus king of the Lombards, inviting them into Italy. Along with the messengers he sent some of the best fruits the country afforded, in order to tempt him the more to become master of such a rich kingdom.

Alboinus, highly pleased with the opportunity of invading a country with which his subjects were already well acquainted, began without loss of time to make the necessary preparations for his journey. In the month of April 568, he set out with his whole nation, men, women, and children; carrying with them all their moveables. This promiscuous multitude arrived by the way of Itria; and advancing through the province of Venetia, found the whole country abandoned, the inhabitants having fled to the neighbouring islands in the Adriatic. The gates of Aquileia were opened by the few inhabitants who had courage to stay: most of them, however, had fled with all their valuable effects; and among the rest the patriarch Paulinus, who had carried with him all the sacred utensils of the churches. From Aquileia, Alboinus proceeded to Forum Julii, of which he likewise became master without opposition. Here he spent the winter; during which time he erected Friuli into a dukedom, which

Italy. has continued ever since. In 569, he made himself master of Trivigi, Oderzo, Monte Selce, Vicenza, Verona, and Trent; in each of which cities he left a strong garrison of Lombards under the command of an officer, whom he distinguished by the title of *duke*: but these dukes were only officers and governors of cities, who bore the title no longer than the prince thought proper to continue them in their command or government. Padua and some other cities Alboinus left behind him without attempting to reduce them, either because they were too well garrisoned, or because they lay too much out of his way. In 570, he entered Liguria. The inhabitants were so terrified at his approach, that they left their habitations with such of their effects as they could carry off, and fled into the most mountainous and inaccessible parts of the country. The cities of Brescia, Bergamo, Lodi, Como, and others quite to the Alps, being left almost without inhabitants, submitted of course; after which he reduced Milan, and was thereupon proclaimed king of Italy.

33  
Who reduce the greatest part of Italy.

But though the Lombards had thus conferred the title of king of Italy on their sovereign, he was by no means possessed of the whole country, nor indeed was it ever in the power of the Lombards to get possession of the whole. Alboinus having made himself master of Venetia, Liguria, Æmilia, Hetruria, and Umbria, applied himself to legislation and the civilisation of his subjects. But before he could make any progress in this work, he was taken off by the treachery of his wife; and Clephis, one of the nobles, chosen king in his stead. Clephis rebuilt some cities which had been ruined during the wars between the Goths and Romans, and extended his conquests to the very gates of Rome; but as he behaved both to the Romans and Lombards with the greatest cruelty, he was murdered, after a short reign of 18 months. His cruelty gave the Lombards such an aversion against regal power, that they changed their form of government, being governed only by their dukes for the space of ten years. During this interregnum, they proved successful in their wars with the Romans, and made themselves masters of several cities: but perceiving that their kingdom, thus divided, could not subsist, they resolved once more to submit to the authority of one man; and accordingly, in 585, Autharis was chosen king of the Lombards.

The great object of ambition to the new race of Lombard monarchs was the conquest of all Italy; and this proved at last the ruin of their empire by Charles the Great, as related under the article FRANCE, n<sup>o</sup> 27. As the Lombards, however, had not been possessed of the whole territory of Italy, so the whole of it never came into the possession of Charlemagne: neither since the time of the Goths, has the whole of this country been under the dominion of any single state. Some of the southern provinces were still possessed by the emperors of Constantinople; and the liberal grants of Pepin and Charlemagne himself to the pope, had invested him with a considerable share of temporal power. The territories of the pope indeed were supposed to be held in vassalage from France; but this the popes themselves always stiffly denied. The undisputed territory of Charlemagne in Italy, therefore, was restricted to Piedmont, the Milanese, the Mantuan, the territory

34  
Subdued by Charlemagne.

35  
Extent of his Italian dominions.

of Genoa, Parma, Modena, Tuscany, Bologna, the dukedoms of Friuli, Spoleto, and Benevento; the last of which contained the greatest part of the present kingdom of Naples.

The feudal government which the Lombards had introduced into Italy, naturally produced revolts and commotions, as the different dukes inclined either to change their masters or to set up for themselves. Several revolts indeed happened during the life of Charlemagne himself; which, however, he always found means to crush: but after his death, the sovereignty of Italy became an object of contention between the kings of France and the emperors of Germany. That great monarch had divided his extensive dominions among his children; but they all died during his lifetime, except Louis, whom he associated with himself in the empire, and who succeeded to all his dominions after his death. From this time we may date the troubles with which Italy was so long overwhelmed; and of which, as they proceeded from the ambition of those called kings of Italy and their nobles, of the kings of France, and of the emperors of Germany, it is difficult to have any clear idea. The following short sketch, however, may perhaps give some satisfaction on this perplexed subject.

At the time Louis the son of Charlemagne was declared emperor of the West, Italy was held by Bernard the son of Pepin, brother to Louis. Though this Bernard bore the title of *king*, yet he was only accounted a vassal of the emperor. His ambition, however, soon prompted him to rebel against his uncle; but being abandoned by his troops, he was taken prisoner, had his eyes pulled out, and died three days after. As the disturbances still continued, and the nobles of Lombardy were yet very refractory, Lothaire, eldest son to the emperor, was in the year 823 sent into Italy; of which country he was first crowned king at Rome, and afterwards emperor of the West, during his father's lifetime. But though his abilities were sufficient to have settled every thing in a state of tranquillity, his unbounded ambition prompted him to engage in rebellion against his father; whom he more than once took prisoner; though in the end he was obliged to submit, and ask pardon for his offences, which was obtained only on condition of his not passing the Alps without leave obtained from his father.

In the mean time, the Saracens, taking advantage of these intestine wars, landed on the coasts of Italy, and committed such ravages, that even the bishops were obliged to arm themselves for the defence of the country. Lothaire, however, after returning from his unnatural war with his father, was so far from attempting to put an end to these ravages, or to restore tranquillity, that he seized on some places belonging to the see of Rome, under pretence that they were part of his kingdom of Lombardy; nor would he forbear these encroachments till expressly commanded to do so by his father. After having embroiled himself, and almost lost all his dominions, in a war with his brothers after the death of Louis, and declared his son, also called *Louis*, king of Italy, this ambitious prince died, leaving to Louis the title of *emperor* as well as *king of Italy*, with which he had before invested him.

The new emperor applied himself to the restoration of tranquillity in his dominions, and driving out the Saracens from those places which they had seized in Italy. This he fully accomplished, and obliged the infidels to retire into Africa; but in 875 he died without naming any successor. After his death, some of the Italian nobles, headed by the duke of Tuscany, represented to the pope, that as Louis had left no successor, the regal dignity, which had so long been usurped by foreigners, ought now to return to the Italians. The pope, however, finding that Charles the Bald, king of France, had such an ambition for the imperial crown, that he would stick at nothing to obtain it, resolved to gratify him, though at as high a price as possible. He accordingly crowned him emperor and king of Lombardy, on condition of his owning the independency of Rome, and that he himself only held the empire by the gift of the pope. This produced a conspiracy among the discontented nobles; and at the same time the Saracens renewing their incursions, threatened the ecclesiastical territories with the utmost danger. The pope solicited the emperor's assistance with the greatest earnestness; but the latter died before any thing effectual could be done: after which, being distressed by the Saracens on one hand, and the Lombard nobles on the other, the unhappy pontiff was forced to fly into France. Italy now fell into the utmost confusion and anarchy; during which time many of the nobles and states of Lombardy assumed an independence, which they have ever since retained.

In 879, the pope was reconducted to Italy with an army by Boson son-in-law to Louis II. of France: but though he inclined very much to have raised this prince to the dignity of king of Italy, he found his interest insufficient for that purpose, and matters remained in their former situation. The nobles, who had driven out the pope, were now indeed reconciled to him: but notwithstanding this reconciliation, the state of the country was worse than ever; the great men renouncing the authority of any superior, and every one claiming to be sovereign in his own territories. To add to the calamities which ensued through the ambition of these despots, the Saracens committed every where the most terrible ravages; till at last the Italian nobles, despising the kings of the Carolingian race, who had weakened themselves by their mutual dissensions, began to think of throwing off even all nominal submission to a foreign yoke, and retaining the imperial dignity among themselves. Thus they hoped, that, by being more united among themselves, they might be more able to resist the common enemy. Accordingly in 885 they went to pope Adrian; and requesting him to join them in asserting the independency of Italy, they obtained of him the two following decrees, viz. That the popes, after their election, might be consecrated without waiting for the presence of the king or his ambassadors; and that, if Charles the Gross died without sons, the kingdom of Italy, with the title of emperor, should be conferred on some of the Italian nobles.

These decrees were productive of the worst consequences imaginable. The emperor complained of being deprived of his right; and the dissensions between the Italian nobles themselves became more fatal than ever. The two most powerful of these noblemen, Be-

rengarius duke of Friuli, and Guido or Vido duke of Spoleto, entered into an agreement, that on the death of the emperor the former should seize on the kingdom of Italy, and the latter on the kingdom of France. Berengarius succeeded without opposition; but Vido was disappointed, the French having already chosen Eudes or Otho for their king. Upon this he returned to Italy, and turned his arms against Berengarius. Vido proved victorious in an engagement, and drove his rival into Germany; where he sought the assistance of Arnolphus, who had succeeded to the crown after the death of Charles. Having thus obtained the kingdom of Italy, Vido employed his time in reforming the abuses of the state, and confirming the grants formerly given to the pope, out of gratitude for his having sanctified his usurpation and declared him lawful king of Italy. This tranquillity, however, was of short duration. Arnolphus sent an army into Italy; the Saracens from Spain ravaged the northern parts of the country, and getting possession of a castle near the Alps, held it for many years after, to the great distress of the neighbouring parts, which were exposed to their continual incursions; and at the same time Benevento was besieged and taken by the forces of the eastern emperor, so that Vido found his empire very considerably circumscribed in its dimensions.

The new king, distressed by so many enemies, associated his son Lambert with him in the government, and bribed the Germans to return to their own country. In 893, however, they again invaded Italy; but were suddenly obliged to leave the country, after having put Berengarius in possession of Pavia. In the mean time, Vido died, and his son Lambert drove out Berengarius: but having joined a faction, headed by one Sergius, against pope Formosus, the latter offered the kingdom of Italy to Arnolphus; who thereupon entered the country with an army, besieged and took Rome, massacring the faction of Sergius with the most unrelenting cruelty.

Arnolphus thus master of Italy, and crowned emperor by the pope, began to form schemes of strengthening himself in his new acquisitions by putting out the eyes of Berengarius: but the latter having timely notice of this treachery, fled to Verona; and the Italians were so provoked at this and the other cruelties of Arnolphus, that they drove him out of the country. His departure occasioned the greatest confusion at Rome. Formosus died soon after; and the successors to the papal dignity, having now no army to fear, excited the greatest disturbances. The body of Formosus was dug up and thrown into the Tiber by one pope; after which that pope was strangled, and Formosus's body buried again in the Vatican, by order of another. At last the coronation of Arnolphus was declared void, the Sergian faction entirely demolished, and the above mentioned decrees of Adrian were annulled; it being now determined that the elected popes should not be consecrated but in presence of the emperor or his ambassadors.

During these confusions Lambert enjoyed the kingdom in quiet; but the nobles hating him on account of his arbitrary and tyrannical government, began again to think of Berengarius. In the mean time, however, another faction offered the crown to Louis king of Arles. This new competitor entered Italy

with...

Italy.

with an army in 899; but was forced by Berengarius to renounce his claim upon oath, and to swear that he would never again enter Italy, even though he should be invited to be crowned emperor.—This oath, however, was soon forgot. Louis readily accepted of another invitation, and was crowned king of Italy at Pavia in 901. The following year he forced Berengarius to fly into Bavaria; but having unadvisedly disbanded his army, as thinking himself now securely seated on the throne, Berengarius, who watched every opportunity, surprised him at Verona, and put out his eyes.

Thus Berengarius at last became king of Italy without a rival; and held his kingdom for 20 years afterwards, without any opposition from his subjects, who at last became sensible of the mischiefs arising from civil discords. He was not yet, however, without troubles. The Hungarians invaded Italy with a formidable army, and advanced within a small distance of Pavia. Berengarius armed the whole force of his dominions; and came against them with such a multitude, that the Hungarians retired without venturing an engagement. A great many of their men were lost in passing a river; upon which they sent deputies to Berengarius, offering to restore all their booty, and never to come again into Italy, provided they were allowed a safe retreat. These conditions were imprudently denied; upon which the Hungarians attacked the army of Berengarius in despair, and defeated them with great slaughter. After this they over-ran the whole country, and plundered the towns of Treviso, Vicenza, and Padua, without resistance, the inhabitants flying every where into fortified places. This devastation they continued for two years; nor could their departure be procured without paying them a large sum of money: which, however, proved of little avail; for the following year they returned and ravaged the territory of Friuli without controul. Scarcely were these invaders departed, when the Saracens, who had settled at the foot of the Alps, invaded Apulia and Calabria, and made an irruption as far as Acqui in the neighbourhood of Pavia; while the inhabitants, instead of opposing them, fled to some forts which had been erected in the time of the first irruption of the Hungarians. In 912, however, John, presbyter of Ravenna, having attained the papal dignity by means of Theodora wife of Alderbert count of Tuscany, applied himself to regulate the affairs of the church, and to repress the insults of the Saracens. While he was considering on the most proper methods of effecting this, one of the Saracens, who had received an injury from his countrymen, fled to Rome, and offered to deliver the Italians from their invasions, if the pope would but allow him a small body of men. His proposals being accepted, 60 young men were chosen, all well armed; who being conducted by the Saracen into by-paths, attacked the infidels as they were returning from their inroads, and several times defeated great parties of them. These losses affecting the Saracens, a general alliance was concluded amongst all their cities; and having fortified a town on the Garigliano, they abandoned the rest, and retired hither. Thus they became much more formidable than before; which alarming the pope, he consulted with Arnulphus prince of Bene-

N<sup>o</sup> 170.

vento and Capua, sending at the same time ambassadors to Constantine the Greek emperor, inviting him to an alliance against the infidels. The Saracens, unable to withstand such a powerful combination, were besieged in their city: where being reduced to great straits, they at last set fire to it, and sallied out into the woods; but being pursued by the Italians, they were all cut off to a man.

In this expedition it is probable that Berengarius gave great assistance; for this very year, 915, he was crowned emperor by the pope. This gave displeasure to many of the ambitious nobles; conspiracies were repeatedly formed against him; in 922, Rodolphus king of Burgundy was crowned also king of Italy; and in 924, Berengarius was treacherously assassinated at Verona; of which disturbances the Hungarians taking the advantage, plundered the cities of Mantua, Brescia, and Bergamo. Marching afterwards to Pavia, they invested it closely on all sides; and about the middle of March 925, taking advantage of the wind, they set fire to the houses next the walls, and during the confusion broke open the gates, and getting possession of the city treated the inhabitants with the greatest barbarity. Having burnt the capital of the kingdom, they next proceeded to Placenza, where they plundered the suburbs; and then returned to Pannonia laden with booty.

The affairs of Italy now fell into the utmost confusion. A faction was formed against Rodolphus in favour of Hugh count of Arles. The latter prevailed, and was crowned king at Pavia in 927. The Italians, however, soon repented of their choice. The Romans first invited him to be their governor, and then drove him out with disgrace; at the same time choosing a consul, tribunes, &c. as if they had designed to assert their ancient liberty. One faction, in the mean time, offered the crown to Rodolphus, and the other to Arnold duke of Bavaria, while the Saracens took this opportunity to plunder the city of Genoa.

Hugh, in the mean time, was not inactive. Having collected an army, he marched directly against Arnold, and entirely defeated him. Rodolphus delivered him from all apprehensions on his part, by entering into an alliance with him, and giving his daughter Adelaide in marriage to Lotharius, Hugh's son. Being thus free from all danger from foreign enemies, he marched against the Romans; but with them he also came to an agreement, and even gave his daughter in marriage to Alberic, whom they had chosen consul. In the mean time the country was infested by the Hungarians and Saracens, and at the same time depopulated by a plague. Endless conspiracies were formed against Hugh himself; and at last, in 947, he was totally deprived of the regal power by Berengarius, grandson to the first king of that name; soon after which he retired into Burgundy, and became a monk.

Though Berengarius was thus possessed of the supreme power, he did not assume the title of king till after the death of Lotharius, which happened in 950; but in the mean time Italy was invaded by Henry duke of Bavaria, and the Hungarians. The former took and plundered the city of Aquileia, and ravaged the neighbouring country; after which he returned without molestation into Germany: the latter made a

furious

furious irruption; and Berengarius being unable to oppose them, was at last obliged to purchase their departure by money. In raising the sum agreed upon, however, Berengarius is said to have been more oppressive than even the Hungarians themselves. Every individual, without distinction of age or sex, was obliged to pay so much for their head, not excepting even the poor. The churches were likewise robbed; by which means the king raised an immense sum of money, 10 bushels of which he gave to the Hungarians, but kept the much greater part to himself.

Berengarius, not yet satisfied, wanted to be put in possession of Pavia, which was held by Adelaide, the widow of Lotharius. In order to obtain his purpose, he proposed a marriage between her and his son Adelbert. This proposal was rejected; upon which Berengarius besieged and took the city. The queen was confined in a neighbouring castle, from whence she made her escape by a contrivance of her confessor. With him and one female attendant she concealed herself for some days in a wood; but being obliged to remove from thence for want of food, she applied for protection to Adalard bishop of Reggio. By him she was recommended to his uncle Atho, who had a strong castle in the neighbourhood of Canozza. Here she was quickly besieged by Berengarius; upon which messengers were dispatched to Otho king of Germany, acquainting him, that, by expelling Berengarius, and marrying Adelaide, he might easily obtain the kingdom of Italy. This proposal he readily accepted, and married Adelaide; but allowed Berengarius to retain the greatest part of his dominions, upon condition of his doing homage for them to the kings of Germany. He deprived him, however, of the dukedom of Friuli and marquisate of Verona, which he gave to Henry duke of Bavaria.

Berengarius, thus freed from all apprehension, not only oppressed his subjects in a most tyrannical manner, but revolted against Otho himself. This at last procured his ruin: for, in 961, Otho returned with an army into Italy, where he was crowned king by the archbishop of Milan; and the year following was crowned emperor by the pope. On this occasion he received the imperial crown from his holiness, and kissed his feet with great humility: after which they both went to the altar of St Peter, and bound themselves by a solemn oath, the pope to be always faithful to the emperor, and to give no assistance to Berengarius or Adelbert his enemies; and Otho, to consult the welfare of the church, and to restore to it all its patrimony granted by former emperors. Otho, besides this, bestowed very rich presents on the church of St Peter. He ordained that the election of popes should be according to the canons; that the elected pope should not be consecrated till he had publicly promised, in presence of the emperor's commissaries, to observe every thing formerly specified with regard to the rights of the emperors; that these commissaries should constantly reside at Rome, and make a report every year how justice was administered by the judges; and in case of any complaints, the commissaries should lay them before the pope; but if he neglected to intimate them, the imperial commissaries might then do what they pleased.

Thus we see that Otho, however much he might

Vol. IX. Part I.

allow the pope's supremacy in spiritual matters, plainly assumed the sovereignty in temporals to himself; and thus Italy was for upwards of 300 years accounted a part of the German empire. The popes, however, by no means relished this superiority of the emperor. The latter was hardly departed, when the pope (John XII.) broke the oath which he had just before sworn with so much solemnity; and entered first into an alliance with Adelbert count of Tuscany to expel the Germans, and then solicited the Hungarians to invade Italy. This treachery was soon punished by Otho. He returned with part of his army, and assembled a council of bishops. As the pope did not appear, Otho pretended great concern for his absence. The bishops replied, that the consciousness of his guilt made him afraid to show himself. The emperor then inquired particularly into his crimes; upon which the bishops accused him of filling the palace with lewd women, of ordaining a bishop in a stable, castrating a cardinal, drinking the devil's health, &c. As the pope still refused to appear in order to justify himself from these charges, he was formally deposed; and Leo the chief secretary, though a layman, elected in his stead.

The new pope, in compliment to the emperor, granted a bull, by which it was ordained that Otho and his successors should have a right of appointing the popes and investing archbishops and bishops; and that none should dare to consecrate a bishop without leave obtained from the emperor. Thus were the affairs of the Italians still kept in the utmost confusion even during the reign of Otho I. who appears to have been a wife and active prince. He was no sooner gone, than the new pope was deposed, all his decrees annulled, and John replaced. The party of Leo was now treated with great cruelty: but John was soon stopped in his career; for about the middle of May, the same year (964) in which he had been restored, being surprised in bed with a Roman lady, he received a blow on the head from the devil (according to the authors of those times), of which he died eight days after. After his death a cardinal-deacon, named *Benedict*, was elected by the Romans, but deposed by Otho, and banished to Hamburgh.

The emperor was scarce returned to Germany, when his slyle Italians revolted, and sent for Adelbert, who had fled to Corsica. But being soon reduced, they continued quiet for about a year; after which they revolted again, and imprisoned the pope. Otho, however, provoked at their rebellious disposition, soon returned, and punished the rebels with great severity; after which he made several laws for the better regulation of the city of Rome, granted several privileges to the Venetians, and caused his son Otho, then only 13 years of age, to be crowned emperor.

This ceremony being over, Otho dispatched an ambassador to Nicephorus, emperor of Constantinople, demanding his step-daughter Theophania in marriage for the young emperor; but upon this alliance being rejected, and that not without circumstances of the most atrocious perfidy, Otho instantly invaded the countries of Apulia and Calabria, and entirely defeated the Greek army in those parts. In the mean time, however, Nicephorus being killed, and his throne usurped by John Zimisces, Otho immediately entered

3 B

The Italians revolt, but are reduced.

Italy. into an alliance with the latter, and easily obtained Theophrasia for his son. She was crowned with great solemnity on the 8th of April 969: at the same time it is pretended by some authors, that the Greeks renounced their rights to Calabria and Apulia; though this is denied by others. After the celebration of this marriage, the emperor undertook an expedition against the Saracens, who still resided at the foot of the Alps; but being informed of the death of several nobles in Germany, he thought proper to return thither, where he died of an apoplexy in the year 973.

42  
State of  
Italy at the  
death of  
Otho.

At the time of Otho's death Italy was divided into the provinces of Apulia, Calabria, the dukedom of Benevento, Campania, Terra Romana, the dukedom of Spoleto, Tuscany, Romagna, Lombardy, and the marquises of Acona, Verona, Friuli, Treviso, and Genoa. Apulia and Calabria were still claimed by the Greeks; but all the rest were either immediately subject to, or held of, the kings of Italy. Otho conferred Benevento (including the ancient Samnium) on the duke of that name. Campania and Lucania he gave to the dukes of Capua, Naples, and Salerno. Rome with its territory, Ravenna with the exarchate, the dukedom of Spoleto, with Tuscany, and the marquise of Ancona, he granted to the pope; and retained the rest of Italy under the form of a kingdom. Some of the cities were left free, but all tributary. He appointed several hereditary marquises and counties, but reserved to himself the sovereign jurisdiction in their territories. The liberty of the cities consisted in a freedom to choose their own magistrates, to be judged by their own laws, and to dispose of their own revenues, on condition that they took the oath of allegiance to the king, and paid the customary tribute. The cities that were not free were governed by the commissaries or lieutenants of the emperor; but the free cities were governed by two or more consuls, afterwards called *scabini*, chosen annually, who took the oath of allegiance to the emperor before the bishop of the city or the emperor's commissary. The tribute exacted was called *fodrum, parata, et mansuetudinum*. By the *fodrum* was meant a certain quantity of corn which the cities were obliged to furnish to the king when marching with an army or making a progress through the country; though the value of this was frequently paid in money. By the *parata* was understood the expence laid out in keeping the public roads and bridges in repair; and the *mansuetudinum* included those expences which were required for lodging the troops or accommodating them in their camp. Under pretence of this last article the inhabitants were sometimes stripped of all they possessed except their oxen and seed for the land. Besides regulating what regarded the cities, Otho distributed honours and possessions to those who had served him faithfully. The honours consisted in the titles of *duke, marquis, count, captain, valvasor, and valvasin*; the possessions were, besides land, the duties arising from harbours, ferries, roads, fish-ponds, mills, salt-pits, the uses of rivers, and all pertaining to them, and such like. The dukes, marquises, and counts, were those who received dukedoms, marquises, and counties, from the king in fiefs; the captains had the command of a certain number of men by a grant from the king, duke, marquis, or count; the valvasors

were subordinate to the captains, and the valvasins to them.

No sooner was the death of Otho I. known in Italy, than, as if they had been now freed from all restraint, the nobles declared war against each other: some cities revolted, and chose to themselves consuls; while the dominions of others were seized by the nobles, who confirmed their power by erecting citadels. Rome especially was harassed by tumults, occasioned chiefly by the seditious practices of one Cincius, who pressed his fellow-citizens to restore the ancient republic. As the pope continued firm in the interests of the emperor, Cincius caused him to be strangled by one Franco a cardinal deacon; who was soon after rewarded with the pontificate, and took upon him the name of *Boniface VIII*. Another Pope was chosen by the faction of the count of Tuscany; who being approved by the emperor, drove Cincius and Boniface out of the city. Disturbances of a similar kind took place in other cities, though Milan continued quiet and loyal in the midst of all this uproar and confusion.

In the mean time Boniface fled for refuge to Constantinople, where he excited the emperor to make war against Otho II. In 979 an army was accordingly sent into Italy, which conquered Apulia and Calabria; but the next year Otho entered Italy with a formidable army; and having taken a severe revenge on the authors of the disturbances, drove the Greeks entirely out of the provinces they had seized. Having then caused his son Otho III. at that time a boy of ten years of age, to be proclaimed emperor, he died at Rome in the year 983. Among the regulations made by this emperor, one is very remarkable, and must give us a strange idea of the inhabitants of Italy at that time. He made a law, That no Italian should be believed upon his oath; and that in any dispute which could not be decided otherwise than by witnesses, the parties should have recourse to a duel.

Otho III. succeeded to the empire at twelve years of age; and during his minority the disturbances in Italy revived. Cincius, called also *Crescentius*, renewed his scheme of restoring the republic. The pope (John XV.) opposing his schemes, was driven out of the city; but was soon after recalled, on hearing that he had applied to the emperor for assistance. A few years after Crescentius again revolted, and expelled Gregory V. the successor of John XV.; raising to the papal dignity a creature of his own, under the name of *John XVI*. Otho, enraged at this insult, returned to Rome with a powerful army in 993, besieged and took it by assault; after which he caused Crescentius to be beheaded, and the pope he had set up to be thrown headlong from the castle of St Angelo, after having his eyes pulled out, and his nose cut off. Four years after, he himself died of the small-pox; or, according to some, was poisoned by the widow of Crescentius, whom he had debauched under a promise of marriage, just as he was about to punish the Romans for another revolt.

Otho succeeded in the imperial throne by Henry duke of Bavaria, and grandson to Otho II. Henry had no sooner settled the affairs of Germany, than he found it necessary to march into Italy against Arduin marquis of Ivrea, who had assumed the title of *King*

of Italy. Him he defeated in an engagement, and was himself crowned king of Italy at Pavia in 1005; but a few years after, a new contest arose about the papal chair, which again required the presence of the emperor. Before he arrived, however, one of the competitors (Benedict VIII.) had got the better of his rival, and both Henry and his queen received the imperial crown from his hands. Before the emperor entered the church, the pope proposed to him the following question: "Will you observe your fidelity to me and my successors in every thing?" To which, though a kind of homage, he submitted, and answered in the affirmative. After his coronation, he confirmed the privileges bestowed on the Roman see by his predecessors, and added some others of his own; till, however, reserving for himself the sovereignty and the power of sending commissaries to hear the grievances of the people. Having repelled the incursions of the Saracens, reduced some more rebellions of his subjects, and reduced the greatest part of Apulia and Calabria, he died in the year 1024.

The death of this emperor was, as usual, followed by a competition for the crown. Conrad being chosen emperor of Germany, was declared king of Italy by the archbishop of Milan; while a party of the nobles made offer of the crown to Robert king of France, or his son Hugh. But this offer being declined, and likewise another to William duke of Guienne, Conrad enjoyed the dignity conferred on him by the archbishop without molestation. He was crowned king of Italy at Monza in 1026; and the next year he received the imperial crown from pope John XX. in presence of Canute the Great, king of England, Denmark, and Norway, and Rodolph III. king of Burgundy. His reign was similar to that of his predecessors. The Italians revolted, the pope was expelled, the malecontents were subdued, and the pope restored; after which the emperor returned to Germany, and died in 1039.

Under Henry III. who succeeded Conrad, the disturbances were prodigiously augmented. Pope Sylvester II. was driven out by Benedict; who in his turn was expelled by John bishop of Sabinum, who assumed the title of *Sylvester III.* Three months after Benedict was restored, and excommunicated his rivals; but soon after resigned the pontificate for a sum of money. In a short time he reclaimed it; and thus there were at once three popes, each of whom was supported on a branch of the papal revenue, while all of them made themselves odious by the scandalous lives they led. At last a priest called *Gratian* put an end to this singular triumvirate. Partly by artifice, and partly by presents, he persuaded all the three to renounce their pretensions to the papacy; and the people of Rome, out of gratitude for so signal a service to the church, chose him pope, under the name of *Gregory VI.* Henry III. took umbrage at this election, in which he had not been consulted, and marched with an army into Italy. He deposed Gregory, as having been guilty of simony; and filled the papal chair with his own chancellor *Heidiger*, bishop of Bamberg, who assumed the name of *Clement II.* and afterwards consecrated Henry and the empress *Agnes*. This ceremony being over, and the Romans having sworn never to elect a pope without the appro-

bation of the reigning emperor, Henry proceeded to Capua, where he was visited by *Drigo*, *Ritaulphus*, and other Norman adventurers; who leaving their country at different times, had made themselves masters of great part of Apulia and Calabria, at the expense of the Greeks and Saracens. Henry entered into treaty with them; and not only solemnly invested them with those territories which they had acquired by conquest, but prevailed on the pope to excommunicate the Beneventines, who had refused to open their gates to him, and bestowed that city and its dependencies, as fiefs of the empire, upon the Normans, provided they took possession by force of arms. The emperor was scarce returned to Germany when he received intelligence of the death of *Clement II.* He was succeeded in the apostolic see by *Damasus II.*; who also dying soon after his elevation, Henry nominated *Bruno* bishop of *Toul* to the vacant chair. This *Bruno*, who was the emperor's relation, immediately assumed the pontifical; but being a modest and pious prelate, he threw them off on his journey, by the persuasion of a monk of *Cluny*, name *Hildebrand*, afterwards the famous *Gregory VII.* and went to Rome as a private man. "The emperor alone (said *Hildebrand*) has no right to create a pope." He accompanied *Bruno* to Rome, and secretly retarded his election, that he might arrogate to himself the merit of obtaining it. The scheme succeeded to his wish: *Bruno*, who took the name of *Leo IX.* believing himself indebted to *Hildebrand* for the pontificate, favoured him with his particular friendship and confidence; and hence originated the power of this enterprising monk, of obscure birth, but boundless ambition, who governed Rome so long, and whose zeal for the exaltation of the church occasioned so many troubles to Europe.

*Leo* soon after his elevation waited on the emperor at *Worms*, to crave assistance against the Norman princes, who were become the terror of Italy, and treated their subjects with great severity. *Henry* furnished the pope with an army; at the head of which he marched against the Normans, after having excommunicated them, accompanied by a great number of bishops and other ecclesiastics, who were all either killed or taken prisoners, the Germans and Italians being totally routed. *Leo* himself was led captive to Benevento, which the Normans were now masters of, and which *Henry* had granted to the pope in exchange for the fief of *Bamberg* in Germany; and the apostolic see is to this day in possession of Benevento, by virtue of that donation. The Normans, however, who had a right to the city by a prior grant, restored it, in the mean time, to the princes of *Lombardy*; and *Leo* was treated with so much respect by the conquerors, that he revoked the sentence of excommunication, and joined his sanction to the imperial investiture for the lands which they held in Apulia and Calabria. *Leo* died soon after his release; and the emperor about the same time caused his infant son, afterwards the famous *Henry IV.* to be declared king of the Romans, a title still in use for the acknowledged heir of the empire. *Gebhard*, a German bishop, was elected pope, under the name of *Vidor II.* and confirmed by the address of *Hildebrand*, who waited on the emperor in person for that purpose, though he disdain-

Italy.

to consult him beforehand. Perhaps Hildebrand would not have found this task so easy, had not Henry been involved in a war with the Hungarians, who pressed him hard, but whom he obliged at last to pay a large tribute, and furnish him annually with a certain number of fighting men.

As soon as the emperor had finished this war and others to which it gave rise, he marched into Italy to inspect the conduct of his sister Beatrice, widow of Boniface marquis of Mantua, and made her prisoner. She had married Gozelo, duke of Lorraine, without the emperor's consent; and contracted her daughter Matilda, by the marquis of Mantua, to Godfrey duke of Spoleto and Tuscany, Gozelo's son by a former marriage. This formidable alliance justly alarmed Henry; he therefore attempted to dissolve it, by carrying his sister into Germany, where he died soon after his return, in the 39th year of his age, and the 16th of his reign.

This emperor, in his last journey to Italy, concluded an alliance with Contarini, doge of Venice. That republic was already rich and powerful, though it had only been enfranchised in the year 998, from the tribute of a mantle of cloth of gold, which it formerly paid, as a mark of subjection to the emperors of Constantinople. Genoa was the rival of Venice in power and in commerce, and was already in possession of the island of Corsica which the Genoese had taken from the Saracens. These two cities ingrossed at this time almost all the trade of Europe. There was no city in any respect equal to them either in France or Germany.

48  
Increase of  
the pope's  
power.

Henry IV. was only five years old at his father's death. The popes made use of the respite given them by his minority, to shake off in a great measure their dependence upon the emperors. After a variety of contests about the pontificate, Nicholas II. a creature of Hildebrand's, was elected; who, among others, passed the following celebrated decree, viz. That for the future, the cardinals only should elect the pope; and that the election should afterwards be confirmed by the rest of the clergy and the people, "saving the honour (adds he) due to our dear son Henry, now king; and who, if it please God, shall be one day emperor, according to the right which we have already conferred upon him." After this he entered into a treaty with the Norman princes above mentioned; who, though they had lately sworn to hold their possessions from the emperor, now swore to hold them from the pope; and hence arose the pope's claim of sovereignty over the kingdom of Naples and Sicily.

49  
His contest  
with the  
emperor.

Thus was the power of the German emperors in Italy greatly diminished, and that of the popes proportionally exalted; of which Henry soon had sufficient evidence. For having assumed the government into his own hands in the year 1072, being then 22 years of age, he was summoned by Alexander II. to appear before the tribunal of the holy see, on account of his loose life, and to answer the charge of having exposed the investiture of bishops to sale; at the same time that the pope excited his German subjects to rebel against him. The rebels, however, were defeated, and peace was restored to Germany: but soon after, Hildebrand above mentioned being elected to the pontificate under the name of Gregory VII. openly assumed the superiority over every earthly mo-

narch whatever. He began with excommunicating every ecclesiastic who should receive a benefice from the hands of a layman, and every layman who should take upon him to confer such a benefice. Henry, instead of resenting this insolence, submitted, and wrote a penitential letter to the pope: who, upon this, condescended to take him into favour, after having severely reprimanded him for his loose life; of which the emperor now confessed himself guilty.

The quarrel between the church and the emperor was, however, soon brought to a crisis by the following accident. Solomon, king of Hungary, being deposed by his brother Geyfa, had fled to Henry for protection, and renewed the homage of Hungary to the empire. Gregory, who favoured Geyfa, exclaimed against this act of submission; and said in a letter to Solomon, "You ought to know that the kingdom of Hungary belongs to the Roman church; and learn that you will incur the indignation of the holy see, if you do not acknowledge that you hold your dominions of the pope and not of the emperor." Henry, though highly provoked at this declaration, thought proper to treat it with neglect; upon which Gregory resumed the dispute about investitures. The predecessors of Henry had always enjoyed the right of nominating bishops and abbots, and of giving them investiture by the cross and the ring. This right they had in common with almost all princes. The predecessors of Gregory VII. had been accustomed, on their part, to send legates to the emperors, in order to treat their assistance, to obtain their confirmation, or desire them to come and receive the papal sanction, but for no other purpose. Gregory, however, sent two legates to summon Henry to appear before him as a delinquent, because he still continued to bestow investitures, notwithstanding the apostolic decree to the contrary; adding, that if he should fail to yield obedience to the church, he must expect to be excommunicated and dethroned. Incensed at this arrogant message from one whom he considered as his vassal, Henry dismissed the legates with very little ceremony, and in 1076 convoked an assembly of all the princes and dignified ecclesiastics at Worms; where, after mature deliberation, they concluded, that Gregory having usurped the chair of St Peter by indirect means, infected the church of God with a great many novelties and abuses, and deviated from his duty to his sovereign in several scandalous attempts, the emperor, by that supreme authority derived from his predecessors, ought to divest him of his dignity, and appoint another in his place. In consequence of this determination, Henry sent an ambassador to Rome, with a formal deprivation of Gregory; who, in his turn, convoked a council, at which were present 110 bishops, who unanimously agreed that the pope had just cause to depose Henry, to dissolve the oath of allegiance which the princes and states had taken in his favour, and to prohibit them from holding any correspondence with him on pain of excommunication; which was immediately fulminated against the emperor and his adherents. "In the name of Almighty God, and by our authority (said Gregory), I prohibit Henry, the son of our emperor Henry, from governing the Teutonic kingdom and Italy: I release all Christians from their oath of allegiance to him; and strictly forbid all persons from serving or attending him as king!" The circular

Italy. cular letters written by this pontiff breathe the same spirit with his sentence of deposition. He there repeats several times, that "bishops are superior to kings, and made to judge them!" expressions alike artful and presumptuous, and calculated for bringing in all the churchmen of the world to his standard.

Gregory knew well what consequences would follow the thunder of the church. The German bishops came immediately over to his party, and drew along with them many of the nobles: the flame of civil war still lay smothering, and a bull properly directed was sufficient to set it in a blaze. The Saxons, Henry's old enemies, made use of the papal displeasure as a pretence for rebelling against him. Even Guelfe, to whom the emperor had given the duchy of Bavaria, supported the malecontents with that power which he owed to his sovereign's bounty: nay, those very princes and prelates who had assisted in deposing Gregory, gave up their monarch to be tried by the pope; and his holiness was solicited to come to Augsberg for that purpose.

Willing to prevent this odious trial at Augsberg, Henry took the unaccountable resolution of suddenly passing the Alps at Tirol, accompanied only by a few domestics, to ask absolution of Pope Gregory his oppressor; who was then in Canosa, on the Apennine mountains, a fortress belonging to the countess or duchess Matilda above mentioned. At the gates of this place the emperor presented himself as an humble penitent. He alone was admitted without the outer court; where, being stripped of his robes, and wrapped in sack cloth, he was obliged to remain three days, in the month of January, bare-footed and fasting, before he was permitted to kiss the feet of his holiness; who all that time was shut up with the devout Matilda, whose spiritual director he had long been, and, as some say, her gallant. But be that as it may, her attachment to Gregory, and her hatred to the Germans, was so great, that she made over all her estates to the apostolic see; and this donation is the true cause of all the wars which since that period have raged between the emperors and the popes. She possessed in her own right great part of Tuscany, Mantua, Parma, Reggio, Piacentia, Ferrara, Modena, Verona, and almost the whole of what is now called the *patrimony of St Peter*, from Viterbo to Orvieto; together with part of Umbria, Spoleto, and the Marche of Ancona.

The emperor was at length permitted to throw himself at the pontiff's feet; who condescended to grant him absolution, after he had sworn obedience to him in all things, and promised to submit to his solemn decision at Augsberg: so that Henry got nothing but disgrace by his journey; while Gregory, elated by his triumph, and now looking upon himself (not altogether without reason) as the lord and master of all the crowned heads in Christendom, said in several of his letters, that it was his duty "to pull down the pride of kings."

This extraordinary accommodation gave much disgust to the princes of Italy. They never could forgive the insolence of the pope, nor the abject humility of the emperor. Happily, however, for Henry, their indignation at Gregory's arrogance overbalanced their detestation of his meanness. He took advantage of this temper; and by a change of fortune, hitherto unknown

to the German emperors, he found a strong party in Italy, when abandoned in Germany. All Lombardy took up arms against the pope, while he was raising all Germany against the emperor. Gregory, on the other hand, made use of every art to get another emperor elected in Germany; and Henry, on his part, left nothing undone to persuade the Italians to elect another pope. The Germans chose Rodolph, duke of Suabia, who was solemnly crowned at Mentz; and Gregory, hesitating on this occasion, behaved truly like the supreme judge of kings. He had deposed Henry, but still it was in his power to pardon that prince: he therefore affected to be displeased that Rodolph was consecrated without his order; and declared, that he would acknowledge as emperor and king of Germany, him of the two competitors who should be most submissive to the holy see.

Henry, however, trusting more to the valour of his troops than to the generosity of the pope, set out immediately for Germany, where he defeated his enemies in several engagements: and Gregory, seeing no hopes of submission, thundered out a second sentence of excommunication against him, confirming at the same time the election of Rodolph, to whom he sent a golden crown, on which the following well-known verse, equally haughty and puerile, was engraved:

*Petra dedit Petro, Petrus diadema Rodolpho.*

This donation was also accompanied with a most enthusiastic anathema against Henry. After depriving him of *strength in combat*, and condemning him *never to be victorious*, it concludes with the following remarkable apostrophe to St Peter and St Paul: "Make all men sensible, that as you can bind and loose every thing in heaven, you can also upon earth take from or give to every one, according to his deserts, empires, kingdoms, principalities—let the kings and the princes of the age then instantly feel your power, that they may not dare to despise the orders of your church; let your justice be so speedily executed upon Henry, that nobody may doubt but he falls by your means, and not by chance."

In order to avoid the effects of this second excommunication, Henry assembled at Brixen, in the county of Tirol, about 20 German bishops: who acting also for the bishops of Lombardy, unanimously resolved, that the pope, instead of having power over the emperor, owed him obedience and allegiance; and that Gregory VII. having rendered himself unworthy of the papal chair by his conduct and rebellion, ought to be deposed from a dignity he so little deserved. They accordingly degraded Hildebrand; and elected in his room Guibert, archbishop of Ravenna, a person of undoubted merit, who took the name of *Clement III*. Henry promised to put the new pope in possession of Rome: but he was obliged, in the mean time, to employ all his forces against his rival Rodolph, who had reassembled a large body of troops in Saxony. The two armies met near Mersburg, and both fought with great fury; but the fortune of the day seemed inclined to Rodolph, when his hand was cut off by the famous Godfrey of Bouillon, then in the service of Henry, and afterwards renowned for his conquest of Jerusalem. Discouraged by the misfortune of their chief, the rebels immediately gave way; and Rodolph perceiving his end approaching, ordered the hand that was cut

off to be brought him, and made a speech to his officers on the occasion, which could not fail to have an influence on the emperor's affairs. "Behold (said he) the hand with which I took the oath of allegiance to Henry; and which oath, at the instigation of Rome, I have violated, in perfidiously aspiring at an honour that was not my due."

Thus delivered from this formidable antagonist, Henry soon dispersed the rest of his enemies in Germany, and set out for Italy in order to settle Clement in the papal chair. But the gates of Rome being shut against him, he was obliged to attack it in form. The siege continued upwards of two years; Henry during that time being obliged to quell some insurrections in Germany. The city was at length carried by assault, and with difficulty saved from being pillaged; but Gregory was not taken: he retired into the castle of St Angelo, and thence defied and excommunicated the conqueror. The new pope was, however, consecrated with the usual ceremonies; and expressed his gratitude by crowning Henry, with the concurrence of the Roman senate and people. Mean while the siege of St Angelo was going on; but the emperor being called about some affairs into Lombardy, Robert Guiscard took advantage of his absence to release Gregory, who died soon after at Salerno. His last words, borrowed from the Scripture, were worthy of the greatest saint: "I have loved justice, and hated iniquity; therefore I die in exile!"

Henry, however, did not enjoy all the advantages which might have been expected from the death of Gregory. The subsequent popes trod in the paths of their predecessor. In 1101, Pascal II. excited young Henry to rebel against his father. The emperor did all in his power to dissuade him from proceeding to extremities, but in vain. The young prince persisted in his rebellious intentions; and having by feigned submissions prevailed on the emperor to disband his army, he treacherously seized and confined him. Henry, however, found means to escape from his confinement, and attempted to engage all the sovereigns of Europe in his quarrel; but before any thing effectual could be done, he died at Liege in the year 1106.

The dispute about investitures was not terminated by the deposition and death of Henry IV. His son Henry V. pursued the very same conduct for which he had deposed his father. Pascal opposed him with violence; upon which Henry gave him an invitation into Germany, to end the dispute in an amicable manner. Pascal did not think proper to accept of this invitation; but put himself under the protection of Philip I. king of France, who undertook to mediate between the contending parties. His mediation, however, proved ineffectual, and Henry was prevented by the wars in Hungary and Poland from paying any further attention to the affair of investitures. At last, having settled his affairs in Germany, he took a resolution of going to Rome, in order to settle the dispute personally with the pope. To give his arguments the greater weight, however, he marched at the head of an army of 80,000 men. Pascal received him with great appearance of friendship, but would not renounce the claim of investitures; and Henry, finding himself deceived in his expectations, ordered the pope to be

Italy. seized. The contest put the citizens in arms to defend the pope, and a battle was fought within the walls of Rome. The slaughter was so great, that the waters of the Tiber were tinged with blood. The Romans were defeated, and Pascal was taken prisoner. The latter renounced his right of investiture; solemnly swore never to resume it, and broke his oath as soon as Henry was gone, by fulminating the sentence of excommunication against him. In 1114 died the countess Matilda, who had bequeathed all her dominions to the pope, as we have already observed; but Henry thinking himself the only lawful heir, alleged, that it was not in Matilda's power to alienate her estates, which depended immediately on the empire. He therefore set out for Lombardy, and sent ambassadors to the pope, beseeching him to revoke the sentence of excommunication above-mentioned. Pascal, however, would not even favour the ambassadors with an audience; but dreading the approach of Henry himself, he took refuge among the Norman princes in Apulia. Henry arrived at Rome in 1117; but being soon after obliged to leave it in order to settle some affairs in Tuscany, the pope returned to Rome, but died in a few days. On the third day after his decease, cardinal Cajetan was elected his successor, without the privity of the emperor, under the name of *Gelasius II.* The new pope was instantly deposed by Henry; who set up the archbishop of Prague, under the name of *Gregory VIII.* Gelasius, though supported by the Norman princes, was obliged to take refuge in France, where he died; and the archbishop of Vienna was elected by the cardinals then present under the name of *Calixtus II.*

The new pope attempted an accommodation with Henry; which not succeeding, he excommunicated the emperor, the antipope, and his adherents. He next set out for Rome, where he was honourably received; and Gregory VIII. was forced to retire to Sutri, a strong town garrisoned by the emperor's troops. Here he was besieged by Calixtus and the Norman princes. The city was soon taken, and Gregory thrown into prison by his competitor; but at last, the states of the empire being quite wearied out with such a long quarrel, unanimously supplicated Henry for peace. He referred himself entirely to their decision; and a diet being assembled at Wurtzburg, it was decreed that an embassy should be immediately sent to the pope, desiring that he would convoke a general council at Rome, by which all disputes might be determined. This was accordingly done, and the affair of investitures at length regulated in the following manner, viz. That the emperor should leave the communities and chapters at liberty to fill up their own vacancies, without bestowing investitures with the cross and ring; that he should restore all that he had unjustly taken from the church; that all elections should be made in a canonical manner, in presence of the emperor or his commissaries; and whatever disputes might happen, should be referred to the decision of the emperor, assisted by the metropolitan and his suffragans; that the person elected should receive from the emperor the investiture of the fiefs and secular rights, not with the cross, but with the sceptre; and should pay allegiance to him for these rights only.

After the death of Henry, the usual disorders took place

place in Italy; during which, Roger duke of Apulia conquered the island of Sicily, and assumed the right of creating popes, of whom there were two at that time, viz. Innocent II. and Anacletus. Roger drove out the former, and Lothario emperor of Germany the latter, forcing Roger himself at the same time to retire into Sicily. The emperor then conducted Innocent back to Rome in triumph; and having subdued all Apulia, Calabria, and the rest of Roger's Italian dominions, erected them into a principality, and bestowed it, with the title of *duke*, upon Renaud a German prince, and one of his own relations.

In the reign of Conrad III. who succeeded Lothario, the celebrated factions called the *Guelphs* and *Gibelines*\*, arose, which for many years deluged the cities of Italy with blood. They took their origin during a civil war in Germany, in which the enemies of the emperor were styled *Guelphs*, and his friends *Gibelines*; and these names were quickly received in Italy as well as other parts of the emperor's dominions. Of this civil war many of the cities in Italy took the advantage to set up for themselves; neither was it in the power of Conrad, who during his whole reign was employed in unsuccessful crusades, to reduce them; but in 1158 Frederic Barbarossa, successor to Conrad, entered Italy at the head of a very numerous and well disciplined army. His army was divided into several columns for the convenience of entering the country by as many different routes. Having passed the Alps, he reduced the town of Brescia; where he made several salutary regulations for the preservation of good order and military discipline. Continuing to advance, he besieged Milan, which surrendered at discretion. He was crowned king of Lombardy at Monza; and having made himself master of all the other cities of that country, he ordered a minute inquiry to be set on foot concerning the rights of the empire, and exacted homage of all those who held of it, without excepting even the Bishops. Grievances were redressed; magistracies reformed; the rights of regality discussed and ascertained; new laws enacted for the maintenance of public tranquillity and the encouragement of learning, which now began to revive in the school of Bologna; and, above all, subvassals were not only prohibited from alienating their lands, but also compelled, in their oath to their lords paramount, to except the emperor nominally, when they swore to serve and assist them against all their enemies. The pope took umbrage at this behaviour towards the ecclesiastics: but Frederic justified what he had done, telling his deputies it was but reasonable they should do homage for the fiefs they possessed; as Jesus Christ himself, though the lord of all the sovereigns upon earth, had deigned to pay for himself and St. Peter the tribute which was due to Cæsar.

Frederic having sent commissaries to superintend the election of new magistrates at Milan, the inhabitants were so much provoked at this infringement of their old privileges, that they insulted the imperialists, revolted, and refused to appear before the emperor's tribunal. This he highly resented, and resolved to chastise them severely; for which purpose he sent for a reinforcement from Germany, which soon after arrived with the empress, while he himself ravaged Liguria,

declared the Milanese rebels to the empire, and plundered and burnt the city of Crema which was in alliance with that of Milan.

In the mean time, pope Adrian IV. dying, two opposite factions elected two persons known by the names of *Victor II.* and *Alexander III.* The emperor's allies necessarily acknowledged the pope chosen by him; and those princes who were jealous of the emperor, acknowledged the other. Victor II. Frederic's pope, had Germany, Bohemia, and one half of Italy, on his side; while the rest submitted to Alexander III. The emperor took a severe revenge on his enemies; Milan was razed from the foundation, and salt strewed on its ruins; Brescia and Placentia were dismantled; and the other cities which had taken part with them were deprived of their privileges. Alexander III. however, who had excited the revolt, returned to Rome after the death of his rival; and at his return the civil war was renewed. The emperor caused another pope, and after his death a third, to be elected. Alexander then fled to France, the common asylum of every pope who was oppressed by the emperors; but the flames of civil discord which he had raised continued daily to spread. In 1168, the cities of Italy, supported by the Greek emperor and the king of Sicily, entered into an association for the defence of their liberties; and the pope's party at length prevailed. In 1176, the imperial army, worn out by fatigues and diseases, was defeated by the confederates, and Frederic himself narrowly escaped. About the same time, he was defeated at sea by the Venetians; and his eldest son Henry, who commanded his fleet, fell into the hands of the enemy. The pope, in honour of this victory, sailed out into the open sea, accompanied by the whole senate; and after having pronounced a thousand benedictions on that element, threw into it a ring as a mark of his gratitude and affection. Hence the origin of that ceremony which is annually performed by the Venetians, under the notion of espousing the Adriatic. These misfortunes disposed the emperor towards a reconciliation with the pope: but, reckoning it below his dignity to make an advance, he rallied his troops, and exerted himself with so much vigour in repairing his loss, that the confederates were defeated in a battle; after which he made proposals of peace, which were now joyfully accepted, and Venice was the place appointed for a reconciliation. The emperor, the pope, and a great many princes and cardinals, attended; and there the emperor, in 1177, put an end to the dispute, by acknowledging the pope, kissing his feet, and holding his stirrup while he mounted his mule. This reconciliation was attended with the submission of all the towns of Italy which had entered into an association for their mutual defence. They obtained a general pardon, and were left at liberty to use their own laws and forms of government, but were obliged to take the oath of allegiance to the emperor as their superior lord. Calixtus, the anti-pope, finding himself abandoned by the emperor in consequence of this treaty, made also his submission to Alexander, who received him with great humanity; and in order to prevent for the future those disturbances which had so often attended the elections of the popes, he called a general council, in which it was

Frederic  
succeeded  
by Hen-  
ry VI.

The affairs of Italy being thus settled, Barbarossa returned to Germany; and having quieted some disturbances which had arisen during his absence in Italy, at last undertook an expedition into the Holy Land; where having performed great exploits, he was drowned as he was swimming in the river Cydnus, in the year 1190. He was succeeded by his son Henry VI. who at the same time became heir to the dominions of Sicily by the right of his wife, daughter of William king of that country. After settling the affairs of Germany, the new emperor marched with an army into Italy, in order to be crowned by the pope, and to recover the succession of Sicily, which was usurped by Tancred his wife's natural brother. For this purpose, he endeavoured to conciliate the affections of the Lombards, by enlarging the privileges of Genoa, Pisa, and other cities, in his way to Rome; where the ceremony of the coronation was performed by Celestin III. on the day after Easter in the year 1191. The pope, then in the 86th year of his age, had no sooner placed the crown upon Henry's head than he kicked it off again, as a testimony of the power residing in the sovereign pontiff to make and unmake emperors at his pleasure.

The coronation being over, Henry prepared for the conquest of Naples and Sicily; but in this he was opposed by the pope: for though Celestin considered Tancred as an usurper, and desired to see him deprived of the crown of Sicily, which he claimed as a fief of the see, yet he was much more averse to the emperor's being put in possession of it, as that would render him too powerful in Italy for the interest of the church. Henry, however, without paying any regard to the threats and remonstrances of his holiness, took almost all the towns of Campania, Calabria, and Apulia; inveiled the city of Naples; and sent for the Genoese fleet, which he had before engaged, to come and form the blockade by sea: but before its arrival, he was obliged to raise the siege, in consequence of a dreadful mortality among his troops: and all future attempts upon Sicily were ineffectual during the life of Tancred.

62  
His per-  
nity and  
cruelty.

The whole reign of Henry from this time seems to have been a continued train of the most abominable perfidies and cruelties. Having treacherously seized and imprisoned Richard I. of ENGLAND, in the manner related under that article, no 128—130. he had no sooner received the ransom paid for his royal captive, than he made new preparations for the conquest of Sicily. As Tancred died about this time, the emperor, with the assistance of the Genoese, accomplished his purpose. The queen-dowager surrendered Salerno, and her right to the crown, on condition that her son William should possess the principality of Tarentum; but Henry no sooner found himself master of the place, than he ordered the infant king to be castrated, to have his eyes put out, and to be confined in a dungeon. The royal treasure was transported to Germany, and the queen and her daughter confined in a convent.

In the mean time, the empress, though near the age of 50, was delivered of a son, named *Frederic*; and No 170.

Henry soon after assembled a diet of the princes of Germany, to whom he explained his intentions of rendering the imperial crown hereditary, in order to prevent those disturbances which usually attended the election of emperors. A decree passed for this purpose; and Frederic, yet in his cradle, was declared king of the Romans. Soon after, the emperor being solicited to undertake a crusade, obeyed the injunctions of the pope, but in such a manner as to make it turn out to his own advantage. He convoked a general diet at Worms, where he solemnly declared his resolution of employing his whole power, and even of hazarding his life, for the accomplishment of so holy an enterprise; and he expatiated upon the subject with so much eloquence, that almost the whole assembly took the cross. Nay, such multitudes from all the provinces of the empire enlisted themselves, that Henry divided them into three large armies; one of which, under the command of the bishop of Mentz, took the route of Hungary, where it was joined by Margaret, queen of that country, who entered herself in this pious expedition, and actually ended her days in Palestine: the second was assembled in Lower Saxony, and embarked in a fleet furnished by the inhabitants of Lubeck, Hamburg, Holstein, and Friesland; and the emperor in person conducted the third into Italy, in order to take vengeance on the Normans in Naples and Sicily who had risen against his government.

The rebels were humbled; and their chiefs were condemned to perish by the most excruciating tortures. One Jornandi, of the house of the Norman princes, was tied naked on a chair of red hot iron, and crowned with a circle of the same burning metal, which was nailed to his head. The empress, shocked at such cruelty, renounced her faith to her husband, and encouraged her countrymen to recover their liberties. Resolution sprung from despair. The inhabitants betook themselves to arms; the empress Constantia headed them; and Henry, having dismissed his troops, no longer thought necessary to his bloody purposes, and sent them to pursue their expedition to the Holy Land, was obliged to submit to his wife, and to the conditions which she was pleased to impose on him in favour of the Sicilians. He died at Messina in 1197, soon after this treaty; and, as was supposed, of poison administered by the empress.

The emperor's son Frederic had already been declared king of the Romans, and consequently became emperor on the death of his father; but as Frederic II. was yet a minor, the administration was committed to his uncle the duke of Suabia, both by the will of Henry and by an assembly of the German princes. Other princes, however, incensed to see an elective empire become hereditary, held a new diet at Cologne, and chose Otho duke of Brunswick, son of Henry the Lion. Frederic's title was confirmed in a third assembly, at Arnsburg; and his uncle, Philip duke of Suabia, was elected king of the Romans, in order to give greater weight to his administration. These two elections divided the empire into two powerful factions, and involved all Germany in ruin and desolation. Innocent III. who had succeeded Celestin in the papal chair, threw himself into the scale of Otho, and excommunicated Philip and all his adherents. This able and ambitious pontiff was a sworn enemy of the house of

Frederic

of

of Suabia; not from any personal animosity, but out of a principle of policy. That house had long been terrible to the popes, by its continual possession of the imperial crown; and the accession of the kingdom of Naples and Sicily made it still more to be dreaded: Innocent, therefore, gladly seized the present favourable opportunity for divesting it of the empire, by supporting the election of Otho, and sowing divisions among the Suabian party. Otho was also patronized by his uncle, the king of England; which naturally inclined the king of France to the side of his rival. Faction clashed with faction; friendship with interest; caprice, ambition, or resentment, gave the sway; and nothing was beheld on all hands but the horrors and the miseries of civil wars.

Meanwhile, the empress Constantia remained in Sicily, where all was peace, as regent and guardian for her infant son Frederic II. who had been crowned king of that island, with the consent of pope Celestin III. But she also had her troubles. A new investiture from the holy see being necessary, on the death of Celestin, Innocent III. his successor, took advantage of the critical situation of affairs for aggrandizing the papacy, at the expense of the kings of Sicily. They possessed, as has been already observed, the privilege of filling up vacant benefices, and of judging all ecclesiastical causes in the last appeal: they were really popes in their own island, though vassals of his holiness. Innocent pretended that these powers had been surreptitiously obtained; and demanded, that Constantia should renounce them in the name of her son, and do liege, pure and simple homage for Sicily. But before any thing was settled relative to this affair, the empress died, leaving the regency of the kingdom to the pope; so that he was enabled to prescribe what conditions he thought proper to young Frederic. The troubles of Germany still continued; and the pope redoubled his efforts, to detach the princes and prelates from the cause of Philip, notwithstanding the remonstrances of the king of France, to whom he proudly replied, "Either Philip must lose the empire, or I the papacy." But all these dissensions and troubles in Europe did not prevent the formation of another crusade, or expedition into Asia, for the recovery of the Holy Land. Those who took the cross were principally French and Germans: Baldwin, count of Flanders, was their commander; and the Venetians, as greedy of wealth and power as the ancient Carthaginians, furnished them with ships, for which they took care to be amply paid both in money and territory. The Christian city of Zara, in Dalmatia, had withdrawn itself from the government of the republic: the army of the cross undertook to reduce it to obedience; and it was besieged and taken, notwithstanding the threats and excommunications of the pope.

While the crusaders were spreading desolation through the east, Philip and Otho were in like manner desolating the west. At length Philip prevailed; and Otho, obliged to abandon Germany, took refuge in England. Philip, elated with success, confirmed his election by a second coronation, and proposed an accommodation with the pope, as the means of finally establishing his throne; but before it could be brought about, he fell a sacrifice to private revenge, being assassinated by the count Palatine of Bavaria, whose daugh-

ter he had promised to marry, and afterwards rejected. Otho returned to Germany on the death of Philip; married that prince's daughter; and was crowned at Rome by pope Innocent III. after yielding to the holy see the long disputed inheritance of the countess Matilda, and confirming the rights and privileges of the Italian cities. But these concessions, as far at least as regarded the pope, were only a sacrifice to present policy: Otho, therefore, no sooner found himself in a condition to act offensively, than he resumed his grant; and in 1210 not only recovered the possessions of the empire, but made hostile incursions into Apulia, ravaging the dominions of young Frederic king of Naples and Sicily, who was under the protection of the holy see. For this reason he was excommunicated by Innocent; and Frederic, now 17 years of age, was elected emperor by a diet of the German princes. Otho, however, on his return to Germany, finding his party still considerable, and not doubting but he should be able to humble his rival by means of his superior force, entered into an alliance with his uncle John king of England, against Philip Augustus king of France, A. D. 1213. The unfortunate battle of Bouvines, where the confederates were defeated, completed the fate of Otho. He attempted to retreat into Germany, but was prevented by young Frederic; who had marched into the empire at the head of a powerful army, and was every where received with open arms. Thus abandoned by all the princes of Germany, and altogether without recourse, Otho retired to Brunswick, where he lived four years as a private man, dedicating his time to the duties of religion.

Frederic II. being now universally acknowledged emperor, was crowned at Aix la-Chapelle in 1215, with great magnificence; when, in order to preserve the favour of the pope, he added to the other solemnities of his coronation a vow to go in person to the Holy Land.

The bad success of this expedition hath been already taken notice of under the article *CROISADE*. The emperor had, on various pretences, refused to go into the east; and in 1225, the pope, incensed at the loss of Damietta, wrote a severe letter to him, taxing him with having sacrificed the interests of Christianity by the delaying so long the performance of his vow, and threatening him with immediate excommunication if he did not instantly depart with an army into Asia. Frederic, exasperated at these reproaches, renounced all correspondence with the court of Rome; renewed his ecclesiastical jurisdiction in Sicily; filled up vacant sees and benefices; and expelled some bishops, who were creatures of the pope, on pretence of their being concerned in practices against the state.

The pope at first threatened the emperor with the thunder of the church, for presuming to lift up his hand against the sanctuary; but finding Frederic not to be intimidated, he became sensible of his own imprudence in wantonly incurring the resentment of so powerful a prince, and thought proper to soothe him by submissive apologies and gentle exhortations. They were accordingly reconciled, and conferred together at Veroli in 1226; where the emperor, as a proof of his sincere attachment to the church, published some very severe edicts against heresy, which seem to have authorized the tribunal of the inquisition. A solemn assembly

Italy.

was afterwards held at Ferentino, where both the pope and the emperor were present, together with John de Brienne, titular king of Jerusalem, who was come to Europe to demand succours against the foldan of Egypt. John had an only daughter named *Tolanda*, whom he proposed as a wife to the emperor, with the kingdom of Jerusalem as her dower, on condition that Frederic should within two years perform the vow he had made to lead an army into the Holy Land. Frederic married her on these terms, because he chose to please the pope; and since that time the kings of Sicily have taken the title of *king of Jerusalem*. But the emperor was in no hurry to go and conquer his wife's portion, having business of more importance on his hands at home. The chief cities of Lombardy had entered into a secret league, with a view to renounce his authority. He convoked a diet at Cremona, where all the German and Italian noblemen were summoned to attend. A variety of subjects were there discussed; but nothing of consequence was settled. An accommodation, however, was soon after brought about by the mediation of the pope; who, as umpire of the dispute, decreed, that the emperor should lay aside his resentment against the confederate towns, and that the towns should furnish and maintain 400 knights for the relief of the Holy Land.

Peace being thus concluded, Honorius reminded the emperor of his vow; Frederic promised compliance: but his holiness died before he could see the execution of a project which he seemed to have so much at heart. He was succeeded in the papal chair by Gregory IX. brother of Innocent III.; who, pursuing the same line of policy, urged the departure of Frederic for the holy land; and finding the emperor still backward, declared him incapable of the imperial dignity, as having incurred the sentence of excommunication. Frederic, incensed at such insolence, ravaged the patrimony of St Peter; and was actually excommunicated. The animosity between the Guelphs and Ghibellines revived; the pope was obliged to quit Rome; and Italy became a scene of war and desolation, or rather of an hundred civil wars; which, by inflaming the minds and exciting the resentment of the Italian princes, accustomed them but too much to the horrid practices of poisoning and assassination.

During these transactions, Frederic, in order to remove the cause of all these troubles, and gratify the prejudices of a superstitious age, by the advice of his friends resolved to perform his vow: and he accordingly embarked for the Holy Land, leaving the affairs of Italy to the management of Renaldo duke of Spoleto. The pope prohibited his departure before he should be absolved from the censures of the church; but Frederic went in contempt of the church, and succeeded better than any person who had gone before him. He did not indeed desolate Asia, and gratify the barbarous zeal of the times by spilling the blood of infidels; but he concluded a treaty with Miliden, foldan of Egypt and malter of Syria; by which the end of his expedition seemed fully answered. The foldan ceded to him Jerusalem and its territory as far as Joppa; Bethlehem, Nazareth, and all the country between Jerusalem and Ptolemais; Tyre, Sidon, and the neighbouring territories: in return for which, the emperor granted the Saracens a truce of ten years; and in 1230

prudently returned to Italy, where his presence was much wanted.

Frederic's reign, after his return from the east, was one continued quarrel with the popes. The cities of Lombardy had revolted during his absence, at the instigation of Gregory IX.; and before they could be reduced, the same pontiff excited the emperor's son Henry, who had been elected king of the Romans, to rebel against his father. The rebellion was suppressed, the prince was confined, and the emperor obtained a complete victory over the associated towns. But his troubles were not yet ended. The pope excommunicated him anew, and sent a bull, filled with the most absurd and ridiculous language, into Germany, in order to sow division between Frederic and the princes of the empire.

Frederic retorted in the same strain, in his apology to the princes of Germany, calling Gregory *the Great Dragon*, the *Antichrist*, &c. The emperor's apology was sustained in Germany; and finding he had nothing to fear from that quarter, he resolved to take ample vengeance on the pope and his associates. For that purpose he marched to Rome, where he thought his party was strong enough to procure him admission; but this favourite scheme was defeated by the activity of Gregory, who ordered a crusade to be preached against the emperor, as an enemy of the Christian faith; a step which incensed Frederic so much, that he ordered all his prisoners who wore the cross to be exposed to the most cruel tortures. The two factions of the Guelphs and Ghibellines continued to rage with greater violence than ever, involving cities, districts, and even private families, in troubles, divisions, and civil butchery; no quarter being given on either side. Meanwhile Gregory IX. died, and was succeeded in the see of Rome by Celestin IV. and afterwards by Innocent IV. formerly cardinal Fiesque, who had always expressed the greatest regard for the emperor and his interest. Frederic was accordingly congratulated upon this occasion: but having more penetration than those about him, he sagely replied, "I see little reason to rejoice; the cardinal was my friend, but the pope will be my enemy." Innocent soon proved the justice of this conjecture. He attempted to negotiate a peace for Italy; but not being able to obtain from Frederic his exorbitant demands, and in fear for the safety of his own person, he fled into France, assembled a general council at Lyons, and in 1245 deposed the emperor.

Conrad, the emperor's second son, had already been declared king of the Romans, on the death of his brother Henry, which soon followed his confinement: but the empire being now declared vacant by the pope, the German bishops (for none of the princes were present), at the instigation of his holiness, proceeded to the election of a new emperor; and they chose Henry landgrave of Thuringia, who was styled in derision, *The king of priests*. Innocent now renewed the crusade against Frederic. It was proclaimed by the preaching friars, since called *Dominicans*, and the minor friars, known by the name of *Cordeliers* or *Franciscans*. The pope, however, did not confine himself to these measures only, but engaged in conspiracies against the life of an emperor who had dared to resist the decree of a council, and oppose the whole body of the monks and zealots.

zealots. Frederic's life was several times in danger from plots, poisonings, and assassinations; which induced him, it is said, to make choice of Mahometan guards, who, he was certain, would not be under the influence of the prevailing superstition.

About this time the landgrave of Thuringia dying, the same prelates who had taken the liberty of creating one emperor made another; namely, William count of Holland, a young nobleman of 20 years of age, who bore the same contemptuous title with his predecessor. Fortune, which had hitherto favoured Frederic, seemed now to desert him. He was defeated before Parma which he had long besieged; and to complete his misfortune, he soon after learned, that his natural son Entius, whom he had made king of Sardinia, was worsted and taken prisoner by the Bolognese.

In this extremity Frederic retired to his kingdom of Naples, in order to recruit his army; and there died of a fever in the year 1250. After his death, the affairs of Germany fell into the utmost confusion, and Italy continued long in the same distracted state in which he had left it. The clergy took arms against the laity; the weak were oppressed by the strong; and all laws divine and human were disregarded. After the death of Frederic's son Conrad who had assumed the imperial dignity as successor to his father, and the death of his competitor William of Holland, a variety of candidates appeared for the empire, and several were elected by different factions; among whom was Richard earl of Cornwall, brother to Henry II. king of England: but no emperor was properly acknowledged till the year 1273, when Rodolph, count of Hapsburg, was unanimously raised to the vacant throne. During the interregnum which preceded the election of Rodolph, Denmark, Holland, and Hungary, entirely freed themselves from the homage they were wont to pay to the empire; and much about the same time several German cities erected a municipal form of government, which still continues. Lubeck, Cologne, Brunswic, and Dantzic, united for their mutual defence against the encroachments of the great lords, by a famous association, called the *Hanseatic league*; and these towns were afterwards joined by 80 others, belonging to different states, which formed a kind of commercial republic. Italy also, during this period, assumed a new plan of government. That freedom for which the cities of Lombardy had so long struggled, was confirmed to them for a sum of money: they were emancipated by the fruits of their industry. Sicily likewise changed its government and its prince; of which revolution a particular account is given under the article SICILY.

From the time of Frederic II. we may date the ruin of the German power in Italy. The Florentines, the Pisans, the Genoese, the Luccans, &c. became independent, and could not again be reduced. The power of the emperor, in short, was in a manner annihilated, when Henry VII. undertook to restore it in the beginning of the 14th century. For this purpose a diet was held at Francfort, where proper supplies being granted for the emperor's journey, well known by the name of the *Roman expedition*, he set out for Italy, accompanied by the dukes of Austria and Bavaria, the archbishop of Triers, the bishop of Liege, the counts

of Savoy and Flanders, and other noblemen, together with the militia of all the imperial towns. Italy was still divided by the factions of the Guelphs and Ghibelines, who butchered one another without humanity or remorse. But their contest was no longer the same: it was not now a struggle between the empire and the priesthood, but between faction and faction, inflamed by mutual jealousies and animosities. Pope Clement V. had been obliged to leave Rome, which was in the anarchy of popular government. The Colonnas, the Ursini, and the Roman barons, divided the city; and this division was the cause of a long abode of the popes in France, so that Rome seemed equally lost to the popes and the emperors. Sicily was in the possession of the house of Arragon, in consequence of the famous massacre called the *Sicilian vespers*, which delivered that island from the tyranny of the French. Carobert, king of Hungary, disputed the kingdom of Naples with his uncle Robert, son of Charles II. of the house of Anjou. The house of Este had established itself at Ferrara; and the Venetians wanted to make themselves masters of that country. The old league of the Italian cities no longer subsisted. It had been formed with no other view than to oppose the emperors; and since they had neglected Italy, the cities were wholly employed in aggrandizing themselves, at the expence of each other. The Florentines and the Genoese made war upon the republic of Pisa. Every city was also divided into factions within itself. In the midst of these troubles Henry VII. appeared in Italy in the year 1311, and caused himself to be crowned king of Lombardy at Milan. But the Guelphs had concealed the old iron crown of the Lombard kings, as if the right of reigning were attached to a small circlet of metal. Henry ordered a new crown to be made, with which the ceremony of inauguration was performed.

Cremona was the first place that ventured to oppose the emperor. He reduced it by force, and laid it under heavy contributions. Parma, Vicenza, and Placentia, made peace with him on reasonable conditions. Padua paid 100,000 crowns, and received an imperial officer as governor. The Venetians presented Henry with a large sum of money, an imperial crown of gold enriched with diamonds, and a chain of very curious workmanship. Brescia made a desperate resistance, and sustained a very severe siege; in the course of which the emperor's brother was slain, and his army diminished to such a degree, that the inhabitants marched out under the command of their preect Thibault de Druffati, and gave him battle: but they were repulsed with great loss, after an obstinate engagement; and at last obliged to submit, and their city was dismantled. From Brescia Henry marched to Genoa, where he was received with expressions of joy, and splendidly entertained. He next proceeded to Rome; where, after much bloodshed, he received the imperial crown from the hands of the cardinals. Clement V. who had originally invited Henry into Italy, growing jealous of his success, had leagued with Robert king of Naples and the Ursini faction, to oppose his entrance into Rome. He entered it in spite of them by the assistance of the Colonnas. Now master of that ancient city, Henry appointed it a governor; and ordered, that all the cities and states of I-

See Sicily.

Italy. taly should pay him an annual tribute. In this order he comprehended the kingdom of Naples, to which he was going to make good his claim of superiority by arms, when he died at Benevento in 1313, as is commonly supposed, of poison given him by a Dominican friar, in the consecrated wine of the sacrament.

69  
State of  
Italy since  
that time.

The efforts of Henry VII. were unable to restore the imperial power in Italy. From this time the authority of the emperor in that country consisted in a great measure in the conveniency which the Ghibelines found in opposing their enemies under the sanction of his name. The power of the pope was much of the same nature. He was less regarded in Italy than in any other country in Christendom. There was indeed a great party who called themselves *Guelphs*; but they affected this distinction only to keep themselves independent of the imperialists; and the states and princes who called themselves *Guelphs* paid little more acknowledgment to his holiness than sheltering themselves under his name and authority. The most desperate wars were carried on by the different cities against each other; and in these wars Caltuccio Caltracani, and Sir John Hawkwood an Englishman, are celebrated as heroes. A detail of these transactions would furnish materials for many volumes; and after all seems to be but of little importance, since nothing material was effected by the utmost efforts of valour, and the belligerent states were commonly obliged to make peace without any advantage on either side. By degrees, however, this martial spirit subsided; and in the year 1492, the Italians were so little capable of resisting an enemy, that Charles VIII. of France conquered the whole kingdom of Naples in six weeks, and might easily have subdued the whole country had it not been for his own imprudence. Another attempt on Italy was made by Louis XII. and a third by Francis I. as related under the article FRANCE. In the reigns of Louis XIII. and XIV. an obstinate war was carried on between the French and Spaniards, in which the Italian states bore a very considerable share. The war concluded in 1660, with very little advantage to the French, who have been always unsuccessful in their Italian wars. The like bad success attended them in that part of the world, in the war which commenced between Britain and Spain in the year 1740. But the particulars of these wars, with regard to the different states of Italy, naturally fall to be considered under the history of those states into which the country is now divided; viz. Sardinia, Milan or the Milanese, Genoa, Venice, Tuscany or Florence, Lucca, St Marino, Parma, Mantua, Modena, Rome, and Naples.

70  
Air, &c. of  
Italy.

The air of Italy is very different, according to the different situations of the several countries contained in it. In those on the north of the Apennines it is more temperate, but on the south it is generally very warm. The air of the Campania of Rome, and of the Ferrarese, is said to be unhealthful; which is owing to the lands not being duly cultivated, nor the marshes drained. That of the other parts is generally pure, dry, and healthy. In summer, the heat is very great in the kingdom of Naples; and would be almost intolerable, if it was not somewhat alleviated by the sea-breezes. The soil of Italy in general is very fertile, being watered by a great number of rivers. It produces a great

variety of wines, and the best oil in Europe; excellent silk in abundance; corn of all sorts, but not in such plenty as in some other countries; oranges, lemons, citrons, pomegranates, almonds, raisins, sugar, mulberry-trees without number, figs, peaches, nectarines, apricots, pears, apples, filberts, chestnuts, &c. Most of these fruits were at first imported by the Romans from Asia Minor, Greece, Africa, and Syria, and were not the natural products of the soil. The tender plants are covered in winter on the north side of the Apennines, but on the south side they have no need of it. This country also yields good pasture; and abounds with cattle, sheep, goats, buffaloes, wild boars, mules, and horses. The forests are well stored with game; and the mountains yield not only mines of iron, lead, alum, sulphur, marble of all sorts, alabaster, jasper, porphyry, &c. but also gold and silver; with a great variety of aromatic herbs, trees, shrubs, and ever greens, as thyme, lavender, laurel, and bays, wild olive-trees, tamarinds, juniper, oaks, and pines.

A very extensive trade is carried on in many places in Italy, particularly at Leghorn, Genoa, Bologna, Venice, and Naples; the country having a great variety of commodities and manufactures for exportation, especially wine, oil, perfumes, fruits, and silks. Travellers also bring large sums of money into Italy, besides what they lay out in pictures, curiosities, relics, antiquities, &c.

The Italians are generally well proportioned, though their complexions are none of the best. As to dress, they follow the fashions of the countries on which they border, or to which they are subject; namely, those of France, Spain, and Germany. With respect to their genius and taste in architecture, painting, carving, and music, they are thought to excel greatly, and to leave the other nations of Europe far behind them; but their music seems too soft and effeminate to deserve all the praise bestowed on it; and their houses are far inferior to those of England in respect of convenience. No country hath produced better politicians, historians, poets, painters, and sculptors; we mean since the revival of the arts and sciences, exclusive of those of ancient times. The Italians are very affable, courteous, ingenious, sober, and ready witted; but extremely jealous, vindictive, lascivious, ceremonious, and superstitious. In respect to jealousy, indeed, we are told, that a very extraordinary change has lately taken place; and that the Italians are now no less indulgent and complaisant to their wives than the most polite husbands in France itself. In their tempers, the Italians seem to be a good medium between the French and Spaniards; neither so gay and volatile as the one, nor so grave and solemn as the other. Boiled snails, served up with oil and pepper, or fried in oil, and the hinder parts of frogs, are reckoned dainty dishes. Kites, jackdaws, hawks, and magpies, are also eaten not only by the common people but by the better sort. Wine is drank here both in summer and winter cooled by ice or snow. The women affect yellow hair, as the Roman ladies and courtezans formerly did. They also use paint and washes, both for their hands and faces. The day here is reckoned from sun-set to sun-set, as the Athenians did of old.

ITCH, a cutaneous disease, appearing in small watery;

h, watery pustules on the skin; commonly of a mild nature, though sometimes attended with obstinate and dangerous symptoms. See *MEDICINE-Itch*.

*Itch-Infest.* See *ACARUS*.

In speaking of the manner of finding these insects in the itch, Fabricius observes, that the failure of many who have sought for them has been owing to their having expected to meet with them in the larger vesicles that contain a yellowish fluid like pus; in these, however, he tells us, he has never found them, but in those pustules only which are recent, and contain only a watery fluid. We must therefore, he observes, not expect to find them in the same proportionate number in patients who for many months have been afflicted with the disease, as in those in whom its appearance is recent, and where it is confined to the fingers or wrists. The cause of this difference with respect to the pustules, he conjectures, may be owing to the death of the insect after it has deposited its eggs.

A small transparent vesicle being found, a very minute white point, distinct from the surrounding fluid, may be discovered, and very often even without the assistance of a glass; this is the insect, which may be easily taken out on the point of a needle or penknife, and when placed on a green cloth may be seen much more distinctly, and observed to move.

The author remarks, that even before such a transparent vesicle is formed, we may often discover traces of the insect on the fingers or hands, in a reddish streak or furrow, which is occasioned by the acarus; and he adds, that it is even more usual to find it in these furrows than in the pustules themselves. He tells us, that a friend of his at Hanover (who had the itch in a slight degree, and to whose accurate inquiries with an excellent microscope he acknowledges himself much indebted) found several insects in such furrows. Two of the longest of the furrows were about an inch in extent. They seemed to be thoroughly dry, but exhibited here and there very minute shining and transparent spots. These spots, however, were not at all elevated above the surface of the skin; and although several of them were opened and examined, no insect was found in them. These furrows he has observed only on the hands and fingers, having in vain sought for them on the legs and other parts of the body, in his children, who had the itch in a high degree.

*ITEA*, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking with those of which the order is doubtful. The petals are long, and inserted into the calyx; the capsule unilocular and bivalved. There is but one species, a native of North America. It grows by the sides of rivers, and in other parts where the ground is moist. It rises to the height of eight or ten feet, sending out many branches garnished with spear-shaped leaves placed alternately, and slightly fawed on their edges, of a light green colour. At the extremity of the branches are produced fine spikes of white flowers three or four inches long, standing erect. When these shrubs are in vigour, they will be entirely covered with flowers, so that they make a beautiful appearance during the flowering season, which is in July. They are propagated by layers, and are not injured by the cold of this climate; but are apt to die in summer, if they are planted on a dry

gravelly soil. The shoots should be laid down in autumn, and will be rooted in one year.

*ITHACA* (anc. geog.), an island in the Ionian sea, on the coast of Epirus; the country of Ulysses, near Dulichium, with a town and port situated at the foot of mount Neus. According to Pliny it is about 25 miles in compass; according to Artemidorus only 10; and is now found to be only eight miles round. It is now uninhabited, and called *Jathaco*.

*ITINERARY*, *ITINERARIUM*; a journal or an account of the distances of places. The most remarkable is that which goes under the names of *Antoninus* and *Ethicus*; or, as Barthius found in his copy, *Antoninus Ethicus*; a Christian writer, posterior to the times of Constantine. Another, called *Hierosolymitanum*, from Bourdeaux to Jerusalem, and from Heraclea through Aulona and Rome to Milan, under Constantine. *Itinerarium* denotes a day's march.

*ITIVS PORTUS* (anc. geog.), the *crux geographorum*, such being the difficulty of ascertaining its position. It would be endless to recite the several opinions concerning it, with the several reasons advanced in support of them. Three ports are mentioned by Cæsar; two without any particular name, *viz.* the Higher and the Lower, with respect to the *Portus Itius*. Calais, Boulogne, St Omer, and Whitland, have each in their turn had their several advocates. Cæsar gives two distinctive characters or marks which seem to agree equally to Boulogne, and Whitland, namely, the shortness of the passage, and the situation between two other ports; therefore nothing can with certainty be determined about the situation of the *Portus Itius*.

*ITTIGIUS* (Thomas), a learned professor of divinity at Leipsic, and son of John Ittigius, professor of physic in the same university. He first published *A Treatise upon Burning Mountains*; after which he became a minister, and exercised that function in various churches there. He furnished several papers in the Leipsic acts, besides publishing some historical works and dissertations. He died in 1710.

*ITYS* (fab. hist.), a son of Tereus king of Thrace, by Proene daughter of Pandion king of Athens. He was killed by his mother when he was about six years old, and served up before his father. He was changed into a pheasant, his mother into a swallow, and his father into an owl.

*ITZECUINTEPOTZOTLI*, or *HUNCH-BACKED DOG*, a Mexican quadruped similar to a dog. It is as large as a Maltan dog, the skin of which is varied with white, tawny, and black. Its head is small in proportion to its body, and appears to be joined directly to it on account of the shortness and greatness of its neck; its eyes are pleasing, its ears loose, its nose has a considerable prominence in the middle, and its tail so small, that it hardly reaches half way down its leg; but the characteristic of it is a great hunch which it bears from its neck to its rump. The place where this quadruped most abounds is the kingdom of Michuacan, where it is called *Ahora*.

*ITZEHOA*, an ancient and handsome town of Germany, in the circle of Lower Saxony, and duchy of Holstein. It belongs to the king of Denmark, and is seated on the river Stoer, in E. Long. 9. 25. N. Lat. 54. 8.

Iva  
||  
Juan.

**IVA**, in botany: A genus of the pentandria order, belonging to the monocæcia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The male calyx is common and triphylous; the florets of the disc monopetalous and quinquefid; the receptacle divided by small hairs. There is no female calyx nor corolla; but five florets in the radius; two long styles; and one naked and obtuse feed.

**IVAHAI** is the name of one of the canoes or boats used by the islanders of the South sea for short excursions to sea: it is wall-sided and flat-bottomed. These boats are of different sizes, their length being from 72 feet to 10: but their breadth is by no means in proportion; for those of ten feet are about a foot wide, and those of more than 70 are scarcely two. The fighting ivahah is the longest, with its head and stern considerably raised above the body in a semicircular form: the stern is sometimes 17 or 18 feet high. When they go to sea, they are fastened together side by side, at the distance of about three feet, by strong poles of wood laid across and lashed to the gun-whales. On these, in the fore-part, a stage or platform is raised, about 10 or 12 feet long, somewhat wider than the boats, and supported by pillars about six feet high: on this stage are ranged the fighting men, whose missile weapons are slings and spears; and below the stage the rowers sit. The fishing ivahahs are from 40 feet long to 10; those of 25 feet and upwards occasionally carry sail. The travelling ivahah is always double, and furnished with a small neat house about five or six feet broad, and six or seven feet long.

**JUAN (St) DE LA FRONTERA**, a town of South-America, in Chili, in the province of Chiquito, near the lake Guanacho. The territory of this town is inhabited by 20,000 native Americans, who are tributary to Spain. It contains mines of gold, and produces a kind of almonds that are very delicate. It is seated at the foot of the Andes, in W. Long. 66. 35. S. Lat. 23. 25.

**JUAN de Porto Ricco**, an island of America, and one of the Caribbees, being 100 miles in length and 50 in breadth. It belongs to the Spaniards; and is full of very high mountains, and extremely fertile valleys, interspersed with woods, and well watered with springs and rivulets. It produces sugar, rum, ginger, corn, and fruits; partly proper to the climate, and partly introduced from Spain. Besides, there are so many cattle, that they often kill them for the sake of the skins alone. Here are a great number of uncommon trees, and there is a little gold in the north part of the island. It is commonly said that the air is healthy; and yet the earl of Cumberland, when he had taken this island, lost most of his men by sickness; and for that reason was forced to abandon it. This happened in the reign of Queen Elizabeth. It is subject to storms and hurricanes, like the rest of these islands. It lies to the east of Hispaniola, at the distance of 50 miles.

**JUAN de Porto Ricco**, the capital town of the island of Porto Ricco, with a good harbour defended by several forts, and a bishop's see. It is seated on the north coast of the island, in W. Long. 65. 35. N. Lat. 18. 30.

**JUAN Fernandez**, an island in the great South Sea, in S. Lat. 33. 40. and W. Long. 78. 30. from Lon-

don. It was formerly a place of resort for the buccanniers who annoyed the western coast of the Spanish continent. They were led to resort hither from the multitude of goats which it nourished; to deprive their enemies of which advantage, the Spaniards transported a considerable number of dogs, which increasing greatly, have almost extirpated the goats, who now only find security among the steep mountains in the northern parts, which are inaccessible to their pursuers. There are instances of two men living, at different times, alone on this island for many years; the one a Mufquito Indian; the other Alexander Selkirk, a Scotchman, who was, after five years, taken on board an English ship, which touched here in about 1710, and brought back to Europe. From the history of this recluse, Daniel de Foy is said to have conceived the idea of writing the adventures of Robinson Crusoe. This island was very propitious to the remains of commodore Anson's Squadron in 1741, after having been buffeted with tempests, and debilitated by an inveterate scurvy, during a three months passage round Cape Horn: they continued here three months; during which time the dying crews, who on their arrival could scarcely with one united effort heave the anchor, were restored to perfect health. Captain Carteret, in the Swallow, in 1767, having met with many difficulties and impediments in his passage into the South Sea, by the Straits of Magellans, attempted to make this island in order to recruit the health of his men; but he found it fortified by the Spaniards. and therefore chose rather to proceed to the island of Masafuero. But M. de Bougainville that same year is said to have touched here for refreshments, although in the narrative of the voyage the fact is cautiously suppressed. This island is not quite 15 miles long and about six broad; its only safe harbour is on the north side. It is said to have plenty of excellent water, and to abound with a great variety of esculent vegetables highly antiscorbutic; besides which, commodore Anson sowed a variety of garden-seeds, and planted the stones of plums, apricots, and peaches, which he was many years afterwards informed had thriven greatly; and now doubtless furnish a very valuable addition to the natural productions of this spot. Vast shoals of fish of various kinds frequent this coast, particularly cod of a prodigious size; and it is said in not less abundance than on the banks of Newfoundland. There are but few birds here, and those few are of species well known and common.

**JUAN Blanco**. See **PLATINA**.

**JUBA**, a king of Numidia and Mauritania. He had succeeded his father Hiempsal, and he favoured the cause of Pompey against Julius Cæsar. He defeated Curio whom Cæsar had sent to Africa, and after the battle of Pharsalia he joined his forces to those of Scipio. He was conquered in a battle at Thapsus, and totally abandoned by his subjects. He killed himself with Petreus, who had shared his good fortune and his adversity, in the year of Rome 707. His kingdom became a Roman province, of which Sallust was the first governor.

**JUBA II.** son of the former, was led among the captives to Rome to adorn the triumph of Cæsar. His captivity was the source of the greatest honours, and his application to study procured him more glory than he

he would have obtained from the inheritance of a kingdom. He gained the heart of the Romans by the courteousness of his manners, and Augustus rewarded his fidelity by giving him in marriage Cleopatra the daughter of Antony, and conferring upon him the title of *king*, and making him master of all the territories which his father once possessed, in the year of Rome 723. His popularity was so great, that the Mauritians rewarded his benevolence by making him one of their gods. The Athenians raised him a statue, and the Æthiopians worshipped him as a deity. Juba wrote an history of Rome in Greek, which is often quoted and commended by the ancients. Of it only few fragments remain. He also wrote on the history of Arabia, and the antiquities of Assyria, chiefly collected from Berosus. Besides these he composed some treatises upon the drama, Roman antiquities, the nature of animals, painting, grammar, &c. now lost.

**JUBILEE**, among the Jews, denotes every fiftieth year; being that following the revolution of seven weeks of years; at which time all the slaves were made free, and all lands reverted to their ancient owners. The jubilees were not regarded after the Babylonish captivity. —The word, according to some authors, comes from the Hebrew, *jobel*, which signifies *fifty*: but this must be a mistake, for the Hebrew *יובל* *jobel* does not signify fifty; neither do its letters, taken as cyphers, or according to their numerical power, make that number; being 10, 6, 2, and 30, that is 48. —Others say, that *jobel* signifies a *ram*, and that the jubilee was thus called, because proclaimed with a ram's horn, in memory of the ram that appeared to Abraham in the thicket. Masius chooses to derive the word from *Jubal*, the first inventor of musical instruments, which, for that reason, were called by his name; whence the words *jobel* and *jubilee* came to signify the year of deliverance and remission, because proclaimed with the sound of one of those instruments which at first was no more than the horn of a ram. Others derive *jobel* from *יבב*, *jabal*, in highil *יבביל*, *bobil*, which signifies to recall or return; because this year restored all slaves to their liberty, &c. The institution of this festival is in Lev. xxv. 8, 17.

The learned are divided about the year of jubilee; some maintaining that it was every forty-ninth, and others that it was every fiftieth, year. The ground of the former opinion is chiefly this, that the forty-ninth year being of course a sabbatical year, if the jubilee had been kept on the fiftieth, the land must have had two sabbaths, or have lain fallow two years, which, without a miracle, would have produced a dearth. On the other hand, it is alleged, that the Scripture expressly declares for the fiftieth year, Lev. xxv. 10, 11. And besides; if the jubilee and sabbatical year had been the same, there would have been no need of a prohibition to sow, reap, &c. because this kind of labour was prohibited by the law of the sabbatical year, Lev. xxv. 4, 5. The authors of the Universal History, book i. chap. 7. note R, endeavour to reconcile these opinions, by observing, that as the jubilee began in the first month of the civil year, which was the seventh of the ecclesiastical, it might be said to be either the forty-ninth or fiftieth, according as one or other of these computations were followed. The political design of the law of the jubilee was to prevent the too great oppressions of the poor,

as well as their being liable to perpetual slavery. By this means a kind of equality was preserved through all the families of Israel, and the distinction of tribes was also preserved, that they might be able, when there was occasion, on the jubilee-year, to prove their right to the inheritance of their ancestors. It served also, like the Olympiads of the Greeks, and the Lustræ of the Romans, for the readier computation of time. The jubilee has also been supposed to be typical of the gospel state and dispensation, described by Isaiah, lxi. ver. 1, 2. in reference to this period, as the "acceptable year of the Lord."

**JUBILEE**, in a more modern sense, denotes a grand church solemnity or ceremony, celebrated at Rome, wherein the pope grants a plenary indulgence to all sinners; at least to as many as visit the churches of St Peter and St Paul at Rome.

The jubilee was first established by Boniface VII. in 1300, in favour of those who should go *ad lmina apostolorum*; and it was only to return every hundred years. But the first celebration brought in such store of wealth to Rome, that the Germans called this the *golden year*; which occasioned Clement VI. in 1343, to reduce the period of the jubilee to fifty years. Urban VI. in 1389, appointed it to be held every thirty-five years, that being the age of our Saviour; and Paul II. and Sixtus IV. in 1475, brought it down to every twenty-five, that every person might have the benefit of it once in his life. Boniface IX. granted the privilege of holding jubilees to several princes and monasteries: for instance, to the monks of Canterbury, who had a jubilee every fifty years; when people flocked from all parts to visit the tomb of Thomas a Becket. Jubilees are now become more frequent, and the pope grants them as often as the church or himself have occasion for them. There is usually one at the inauguration of a new pope. To be intitled to the privileges of the jubilee, the bull enjoins fastings, alms, and prayers. It gives the priests a full power to absolve in all cases even those otherwise reserved to the pope: to make commutations of vows, &c. in which it differs from a *plenary indulgence*. During the time of jubilee, all other indulgences are suspended.

One of our kings, viz. Edward III. caused his birth-day to be observed in manner of a jubilee, when he became fifty years of age, in 1362, but never before or after. This he did by releasing prisoners, pardoning all offences except treason, making good laws, and granting many privileges to the people.

There are particular jubilees in certain cities, when several of their feasts fall on the same day: at Pucey en Velay, for instance, when the feast of the Annunciation happens on Good-Friday; and at Lyons when the feast of St John Baptist concurs with the feast of Corpus Christi.

In 1640, the Jesuits celebrated a solemn jubilee at Rome; that being the centenary or hundredth year from their institution, and the same ceremony was observed in all their houses throughout the world.

**JUCATAN**, or **YUCATAN**, a large province of North-America in New Spain, which is a peninsula. It is over against the island of Cuba, and contains a large quantity of timber, proper for building ships; as also sugar, cassia, and Indian corn. The original inhabitants are few, they having been very ill used by

Judah  
||  
Jude.

the Spaniards. Merida is the capital town. It is a flat level country; and is very unhealthy, which may be owing to the frequent inundations.

JUDAH, the fourth son of Jacob, and father of the chief of the tribes of the Jews, distinguished by his name, and honoured by giving birth to the Messiah, died 1636 B. C.

JUDAH *Hakkadosh*, or the Saint, a rabbi celebrated for his learning and riches, lived in the time of the emperor Antoninus, and was the friend and preceptor of that prince. Leo of Modena, a rabbi of Venice, tells us, that rabbi Judah, who was very rich, collected about 26 years after the destruction of the temple, in a book which he called the *Misnia*, the constitutions and traditions of the Jewish magistrates who preceded him. But as this book was short and obscure, two Babylonish rabbis, Rabbina and Ase, collected all the interpretations, disputes, and additions, that had been made until their time upon the *Misnia*, and formed the book called the *Babylonish Talmud* or *Gemara*; which is preferable to the Jerusalem Talmud, composed some years before by rabbi Joehanan of Jerusalem. The *Misnia* is the text of the Talmud; of which we have a good edition in Hebrew and Latin by Surenhusius, with notes, in 3 vols folio. It were to be wished the same had been done to the *Gemara*.

The Kingdom of JUDAH was of small extent compared with that of the kingdom of Israel; consisting only of two tribes, Benjamin and Judah: its east boundary, the Jordan; the Mediterranean its west, in common with the Danites, if we except some places recovered by the Philistines, and others taken by the kings of Israel; on the south, its limits seem to have been contracted under Hadad of the royal progeny of Edom, (1 Kings xi. 14.)

Tribe of JUDAH, one of the 12 divisions of Palestine by tribes (Josh. xv.), having Idumea on the south, from the extremity of the Lacus Asphaltites, also the Wilderness of Zin, Cadefbarnea, and the brook or river of Egypt; on the east, the said lake; on the west, the Mediterranean; and on the north, the mouth of the said lake; where it receives the Jordan, Bethfemes, Thimna, quite to Ekron on the sea.

JUDAISM, the religious doctrines and rites of the Jews. Judaism was but a temporary dispensation, and was to give way, at least the ceremonial part of it, at the coming of the Messiah. For a complete system of Judaism, see the books of Moses. Judaism was anciently divided into several sects; the principal whereof were the Pharisees, Sadducees, and Essenians.

At present there are two sects among the Jews, viz. the Caraites, who admit of no rule of religion but the law written by Moses; and the Rabbinites, who add to the law the traditions of the Talmud.

JUDAS MACCABEUS, a celebrated general of the Jews, renowned for his many victories over his enemies, at last slain in battle, 261 B. C. See (*History of the Jews*, n<sup>o</sup> 13.

JUDAS-Tree. See CERCIS.

JUDE (St.), brother of St James the younger, and son of Joseph (Mat. xiii. 55.). He preached in Mesopotamia, Arabia, Syria, Idumea; and died in Berytus for the confession of Christ. He wrote that epistle which goes under his name, and after the death of most of

N 170.

the apostles. He was cruelly put to death for reproving the superstition of the Magi.

JUDE, or the *General Epistle of Jude*, a canonical book of the New Testament, written against the heretics, who, by their disorderly lives and impious doctrines, corrupted the faith and good morals of the Christians. St Jude draws them in lively colours, as men given up to their passions, full of vanity, conducting themselves by worldly wisdom, and not by the spirit of God.

JUDEA (anc. geog.), taken largely, either denotes all Palestine, or the greater part of it; and thus it is generally taken in the Roman history: Ptolemy, Rutilinus, Jerome, Origen, and Eusebius, take it for the whole of Palestine. Here we consider it as the third part of it on this side the Jordan, and that the southern part is distinct from Samaria and Galilee; under which notion it is often taken, not only in Josephus, but also in the New Testament. It contained four tribes; Judah, Benjamin, Dan, and Simeon, together with Philistia and Idumea; so as to be comprised between Samaria on the north, Arabia Petraea on the south, and to be bounded by the Mediterranean on the west, and by the Lacus Asphaltites, with part of Jordan, on the east. Josephus divides it into 11 toparchies; Pliny into 10; by which it has a greater extent than that just mentioned. See PALESTINE.

JUDENBURG, a handsome and considerable town of Germany, in the circle of Aultria, and capital of Upper Styria, with a handsome castle; the public buildings with the square are very magnificent. It is seated on the river Meur. E. Long. 15. 20. N. Lat. 47. 20.

JUDEX (Matthew), one of the principal writers of the Centuries of Magdeburg, was born at Tipplewolde in Misnia, in 1528. He taught theology with great reputation; but met with many disquiets in the exercise of his ministry from party-feuds. He wrote several works, and died in 1574.

JUDGE, a chief magistrate of the law, appointed to hear causes, to explain the laws, and to pass sentence.

JUDGES, in Jewish antiquity, certain supreme magistrates who governed the Israelites from the time of Joshua till the reign of Saul. These judges resembled the Athenian archons or Roman dictators. The dignity of judge was for life, but not always in uninterrupted succession. God himself, by some express declaration of his will, regularly appointed the judges: But the Israelites did not always wait for his appointment, but sometimes chose themselves a judge in times of danger. The power of the judges extended to affairs of peace and war. They were protectors of the laws, defenders of religion, avengers of all crimes; but they could make no laws, nor impose any new burdens upon the people. They lived without pomp or retinue, unless their own fortunes enabled them to do it; for the revenues of their office consisted in voluntary presents from the people. They continued from the death of Joshua till the beginning of the reign of Saul, being a space of about 339 years.

JUDGES, for ordinary affairs, civil and religious, were appointed by Moses in every city to terminate differences; in affairs of greater consequence, the differences

ferences were referred to the priests of Aaron's family, and the judge of the people or prince at that time established. Moses likewise set up two courts in all the cities, one consisting of priests and Levites, to determine points concerning the law and religion; the other consisting of heads of families, to decide in civil matters.

*Book of Judges*, a canonical book of the Old Testament, so called from its relating the state of the Israelites under the administration of many illustrious persons who were called *judges*, from being both the civil and military governors of the people, and who were raised up by God upon special occasions, after the death of Joshua, till the time of their making a king. In the time of this peculiar polity, there were several remarkable occurrences, which are recorded in this book. It acquaints us with the gross impiety of a new generation which sprung up after the death of Joshua; and gives us a short view of the dispensations of heaven towards this people, sometimes relieving and delivering them, and at others severely chastising them by the hands of their enemies.

*Sæcæ Judicæ*, (*Judices sæcæ*), in antiquity, were persons summoned by the prætor to give their verdict in criminal matters in the Roman courts, as juries do in ours. No person could be regularly admitted into this number till he was 25 years of age. The *Sortitio Judicæ*, or impanelling the jury, was the office of the *Judex Questionis*, and was performed after both parties were come into court, for each had a right to reject or challenge whom they pleased, others being substituted in their room. The number of the *Judices sæcæ* varied, according to the nature of the charge. When the proper number appeared, they were sworn, took their places in the *subsellia*, and heard the trial.

JUDGMENT, among logicians, a faculty or rather act of the human soul, whereby it compares its ideas, and perceives their agreement or disagreement. See METAPHYSICS; and LOGIC, Part II.

JUDGMENT, in law, is the sentence pronounced by the court upon the matter contained in the record. Judgments are of four sorts. First, where the facts are confessed by the parties, and the law determined by the court; as in case of judgment upon *demurrer*: secondly, where the law is admitted by the parties, and the facts disputed; as in the case of judgment on *verdict*: thirdly, where both the fact and the law arising thereon are admitted by the defendant; which is the case of judgments by *confession* or *default*: or, lastly, where the plaintiff is convinced that either fact, or law, or both, are insufficient to support his action, and therefore abandons or withdraws his prosecution; which is the case in judgments upon a *non suit* or *retraxit*.

The judgment, though pronounced or awarded by the judges, is not their determination or sentence, but the determination and sentence of the *law*. It is the conclusion that naturally and regularly follows from the premises of law and fact, which stands thus: Against him who hath rode over my corn, I may recover damages by law; but A hath rode over my corn; therefore I shall recover damages against A. If the major proposition be denied, this is a demurrer in law: if the minor, it is then an issue of fact: but if both be confessed or determined to be right, the conclusion or judgment of the court cannot but follow. Which

VOL. IX. Part I.

judgment or conclusion depends not therefore on the arbitrary caprice of the judge, but on the settled and invariable principles of justice. The judgment, in short, is the remedy prescribed by law for the redress of injuries; and the suit or action is the vehicle or means of administering it. What that remedy may be, is indeed the result of deliberation and study to point out; and therefore the style of the judgment is, not that it is decreed or resolved by the court, for then the judgment might appear to be their own; but, "it is considered," *consideratum est per curiam*, that the plaintiff do recover his damages, his debt, his possession, and the like: which implies that the judgment is none of their own; but the act of law, pronounced and declared by the court, after due deliberation and inquiry. See *Blackl. Comment.* iii. 396.

JUDGMENT, in criminal cases, is the next stage of prosecution, after TRIAL and CONVICTION are past, in such crimes and misdemeanors as are either too high or too low to be included within the benefit of clergy. For when, upon a capital charge, the jury have brought in their VERDICT guilty in the presence of the prisoner; he is either immediately, or at a convenient time soon after, asked by the court, if he has any thing to offer why judgment should not be awarded against him. And in case the defendant be found guilty of a misdemeanor (the trial of which may, and does usually, happen in his absence, after he has once appeared), a *copias* is awarded and issued, to bring him in to receive his judgment; and if he absconds, he may be prosecuted even to outlawry. But whenever he appears in person, upon either a capital or inferior conviction, he may at this period, as well as at his arraignment, offer any exceptions to the indictment, in *arrest* or stay of judgment: as for want of sufficient certainty in setting forth either the person, the time, the place, or the offence. And if the objections be valid, the whole proceedings shall be set aside; but the party may be indicted again. And we may take notice, 1. That none of the statutes of *jeoffails*, for amendment of errors, extend to indictments or proceedings in criminal cases; and therefore a defective indictment is not aided by a verdict, as defective pleadings in civil cases are. 2. That, in favour of life, great strictness has at all times been observed, in every point of an indictment. *Blackl. Comment.* Sir Matthew Hale indeed complains, "that this strictness is grown to be a blemish and inconvenience in the law, and the administration thereof: for that more offenders escape by the over easy ear given to exceptions in indictments, than by their own innocence; and many times gross murders, burglaries, robberies, and other heinous and crying offences, remain unpunished by these unseemly niceties: to the reproach of the law, to the shame of the government, to the encouragement of villainy, and to the dishonour of God." And yet, notwithstanding this laudable zeal, no man was more tender of life than this truly excellent judge.

A pardon also may be pleaded in arrest of judgment: and it has the same advantage when pleaded here as when pleaded upon ARRAIGNMENT; viz. the saving the ATTAINDER, and, of course, the CORRUPTION of blood: which nothing can restore but parliament, when a pardon is not pleaded till after sentence. And certainly, upon all accounts, when a man hath

**Judgment.** obtained a pardon, he is in the right to plead it as soon as possible. See PARDON.

Praying the benefit of clergy may also be ranked among the motions in arrest of judgment. See *Benefit of Clergy*.

If all these resources fail, the court must pronounce that judgment which the law hath annexed to the crime. Of these some are capital, which extend to the life of the offender, and consist generally in being hanged by the neck till dead; though in very atrocious crimes other circumstances of terror, pain, or disgrace, are superadded: as, in treasons of all kinds, being drawn or dragged to the place of execution; in high treason affecting the king's person or government, embowelling alive, beheading, and quartering; and in murder, a public dissection. And in case of any treason committed by a female, the judgment is to be burned alive. But the humanity of the English nation has authorized, by a tacit consent, an almost general mitigation of such parts of these judgments as savour of torture or cruelty: a sledge or hurdle being usually allowed to such traitors as are condemned to be drawn; and there being very few instances (and those accidental or by negligence) of any persons being embowelled or burned, till previously deprived of sensation by strangling. Some punishments consist in exile or banishment, by abjuration of the realm, or transportation to the American colonies: others, in loss of liberty, by perpetual or temporary imprisonment. Some extend to confiscation, by forfeiture of lands, or moveables, or both, or of the profits of lands for life: others induce a disability of holding offices or employments, being heirs, executors, and the like. Some, though rarely, occasion a mutilation or dismembering, by cutting off the hand or ears: others fix a lasting stigma on the offender, by sitting the nostrils or branding in the hand or face. Some are merely pecuniary, by stated or discretionary fines: and, lastly, there are others that consist principally in their ignominy, though most of them are mixed with some degree of corporeal pain; and these are inflicted chiefly for such crimes as either arise from indigence, or tender even opulence disgraceful. Such as whipping, hard labour in the house of correction, the pillory, the stocks, and the ducking-stool.

Disgusting as this catalogue may seem, it will afford pleasure to a British reader, and do honour to the British laws, to compare it with that shocking apparatus of death and torment to be met with in the criminal codes of almost every other nation in Europe. And it is moreover one of the glories of our law, that the nature, though not always the quantity or degree, of punishment is ascertained for every offence; and that it is not left in the breast of any judge, nor even of a jury, to alter that judgment which the law has beforehand ordained for every subject alike, without respect of persons. For, if judgments were to be the private opinions of the judge, men would then be slaves to their magistrates; and would live in society, without knowing exactly the conditions and obligations which it lays them under. And, besides, as this prevents oppression on the one hand; so, on the other, it stifles all hopes of impunity or mitigation, with which an offender might flatter himself if his punishment depended on the humour or discretion

of the court. Whereas, where an established penalty is annexed to crimes, the criminal may read their certain consequence in that law, which ought to be the unvaried rule, as it is the inflexible judge, of his actions.

*JUDGMENT of God.* See *JUDICIUM Dei*.

**JUDICATURE**, the quality or profession of those who administer justice.

**JUDICATURE** is also used to signify the extent of the jurisdiction of the judge, and the court wherein he sits to render justice.

**JUDICIA CENTUMVIRALIA**, in Roman antiquity, were trials before the *Centumviri*, to whom the *prætor* committed the decision of certain matters of inferior nature, like our justices of peace at the quarter sessions. During the *judicia centumviralia*, a spear was stuck up in the forum to signify that the court was sitting.

**JUDICIUM CALUMNIA**, was an action brought against the plaintiff for false accusation. The punishment, upon conviction, was *inutilio frontis*, or branding in the forehead. See *INUTILIO*.

*JUDICIUM Dei*, *Judgment of God*, was a term anciently applied to all extraordinary trials of secret crimes; as those by arms, and single combat, and the ordeals; or those by fire, or red hot plough-shares; by plunging the arm in boiling water, or the whole body in cold water; in hopes God would work a miracle, rather than suffer truth and innocence to perish. *Si super defendere non possit, iudicio Dei, scil. aqua vel ferro, fiet de eo justitia.*—These customs were a long time kept up even among Christians; and they are still in use in some nations. See *BATTEL*, *ORDEAL*, &c.—Trials of this sort were usually held in churches in presence of the bishops, priests, and secular judges; after three days fasting, confession, communion, and many adjurations and ceremonies described at large by Du Cange.

*JUDICIUM Parium* denotes a trial by a man's equals, i. e. of peers by peers, and of commoners by commoners. In *magna charta* it is more than once insisted on as the principal bulwark of our liberties, but especially by chap. 29. that no freeman shall be hurt in either his person or property, *nisi per legale iudicium parium suorum vel per legem terra.* And this was ever esteemed in all countries a privilege of the highest and most beneficial nature.

*JUDICIUM Falsi*, was an action which lay against the judges for corruption or unjust proceedings.

*JUDICIUM Prævaricationis*, was an action brought against the prosecutor, after the criminal was acquitted, for suppressing the evidence of, or extenuating his guilt, rather than urging it home, and bringing it to light.

**JUDOIGNE**, a town of the Austrian Netherlands, in Brabant. Near this town the duke of Marlborough gained that signal victory over the French in 1706, called the *battle of Ramillies*. It is seated on the river Gete, 13 miles south-east of Louvain, and 16 north of Namur.

**IVEACH**, the name of two baronies of Ireland, in the county of Down, and province of Ulster. They are distinguished into Upper and Lower Iveach, and the former is by much the largest barony in that county. The name of *Iveach*, or *Hy Veach*, is said to be taken from *Achaisius*, in Irish called *Eachach*, grandfather to king *Coalbhraig*, as much as to say "the territory

territory of Eachach;" for *hy*, in the Irish language, is a common adjective, denoting not only the heads and founders of families, but also the territories possessed by them. Iweach (including both baronies) was otherwise called the *Magennis's country*, and in queen Elizabeth's time was governed by Sir Hugh Magennis, esteemed to have been one of the most polite of all the natives in those parts. Through part of this barony runs a chain of mountains considerably high, known by the name of *Iweach mountains*.

IUERNUS (anc. geog.), a town in the south-west of Ireland. Now called the *Maire*, or *Kennmare*, running from east to west, in the province of Munster. Situated on the river Maire, in the province of Munster.

IVERNUS, or *Iennis*; Ptolemy; a river in the south-west of Ireland. Now called the *Maire*, or *Kennmare*, running from east to west, in the province of Munster.

IVES, or *Yves* (St), a celebrated bishop of Chartres, born in the territory of Beauvais in the 11th century. His merit procured his election to the see of Chartres in 1092, or 1093, under the pontificate of Urban II. who had deposed Geoffroy his predecessor for sundry accusations against him. Ives particularly signalized himself by his zeal against Philip I. who had put away his wife Bertha of Holland, and had taken Bertrade of Montford, wife of Fouques count of Anjou. Afterward he devoted himself wholly to the functions of his ministry; made several religious foundations; and died in 1115. Pope Pius V. permitted the monks of the congregation of Lateran to celebrate the festival of St. Ives on the 20th of May. We have a collection of decrees of his compiling, *Exceptiones ecclesiasticarum regularum*, a *Chronicon*, and 22 sermons; all very valuable pieces, which were collected and published in one volume folio in 1647, by John Baptist Souciet, canon of Chartres.

IVES (St), a sea port town of Cornwall, in England, seated on a bay of the same name; which being unsafe, it is chiefly frequented by fishermen, for the taking of pilchards. By this trade, however, and that of Cornish slates, it has thriven greatly, and 20 or 30 sail of ships belongs to its harbour. It is a corporation, governed by a mayor, 12 capital and 24 inferior burgeses, with a recorder, town clerk, &c and it sends two members to parliament. Here is a handsome spacious church, which is often buffeted by the waves of the sea; but the mother church is at Unilant. There is a grammar-school here, which was founded by Charles I. It has two markets in the week, and an annual fair.

IVES (St), is also the name of a town in Huntingdonshire, 64 miles from London. It has a fine stone bridge over the Ouse, had in the ninth century a mint, and was noted for its medicinal waters. Great part of it was burnt down some years ago, but it was rebuilt. Here is a very good market on Monday for fatted cattle brought from the north; and there are two fairs in the year. Here Oliver Cromwell rented a farm before he was chosen a burges for Cambridge.

JUGERUM, in Roman antiquity, a square of 120 Roman feet; its proportion to the English acre being as 10.000 to 16.097.

JUGLANS, in botany: A genus of the monœcia order, belonging to the polyandria class of plants; and

in the natural method ranking under the 50th order, *Amentaceæ*. The male calyx is monophyllous, and squamiform; the corolla divided into six parts; there are 18 filaments: the female calyx is quadrid, superior; the corolla quadripartite; there are two styles, and the fruit a plumb with a furrowed kernel. There are five species, the most remarkable of which is the regia or common walnut. This rises 50 feet high or more, with a large upright trunk, branching into a very large spreading head, with large pinnated leaves, of two or three pair of oval, smooth, somewhat serrated lobes, terminated by an odd one; and monœcious flowers, succeeded by clusters of large green fruit, inclosing furrowed nuts of different shapes and sizes in the varieties, ripening in September and October. Other two species, called the *nigra* and *alba*, or black and white Virginian walnut, are also cultivated in this country, though they are less proper for fruit, having very small kernels.

*Culture*. All the sorts are propagated by planting their nuts, which will grow in any common soil. The nuts being procured in the proper season, in their outer covers or husks if possible, they should be preserved in dry sand until February, and then planted. After two years growth in the seed bed, they are to be taken out, and planted in the nursery, where they must remain till grown five or six feet high, when they must be transplanted where they are finally to remain; but if intended for timber as well as fruit trees, they ought to be finally transplanted when they have attained the height of three or four feet.

*Uses*. The fruit is used at two different stages of growth; when green to pickle, and when ripe to eat raw. As a pickle, the nuts may be used when about half or three-fourths grown, before the outer coat or shell becomes hard; such nuts should be chosen as are most free from specks, and for this purpose they must be gathered by hand. Walnuts are ready for pickling in July and August. They are fully ripe in September and October; and are then commonly beat down with long poles, especially on large trees; for as the walnuts grow mostly at the extremities of the branches, it would be troublesome and tedious to gather them by hand. As soon as gathered, lay them in heaps a few days to heat and sweat, to cause their outer husks, which adhere closely, to separate from the shell of the nuts; then clean them from the rubbish, and deposit them in some dry room for use, covering them over close with dry straw half a foot thick, and they will keep three or four months. They are always readily sold at market, especially in London; where, at their first coming in, they are sold with the husks on, by the sack or bushel; but afterwards are bought clean, and sold both by measure and by the thousand. The wood of the walnut-tree is also very valuable; not indeed where strength is necessary, it being of a very brittle nature; but the cabinet-makers and joiners esteem it highly for several sorts of household furniture and other light works; for being beautifully vened, it takes a fine polish, and the more knotty it is, the more it is valued for particular purposes. Walnut-trees are also well adapted for planting round the borders of orchards, where, by their large spreading heads, they will also guard the lesser fruit-trees from

Jugora  
||  
Juice.

boisterous winds. The kernels of the nuts are similar in quality to almonds; but are not like them used in medicine.

**JUGORA**, a considerable province of Muscovy, depending on the government of Archangel. It has the title of a duchy; and is inhabited by a kind of Tartars, who are very savage, and much of the same disposition with the Samoiedes.

**JUGULAR**, among anatomists, is applied to certain veins and glands of the neck. See **ANATOMY**.

**JUGULARES**, in the Linnæan system, is the name of an order or division of fish, the general character of which is, that they have ventral fins before the pectoral fins. See **ZOOLOGY**.

**JUGUM**, an humiliating mode of punishment inflicted by the victorious Romans upon their vanquished enemies. It was thus: They set up two spears, and laying a third across, in the form of a gallows, they ordered those who had surrendered themselves to pass under this ignominious erection, without arms or belts. None suffered the disgrace of passing *sub jugo* but such as had been obliged to surrender.

**JUGURTHA**, the illegitimate son of Mastabal the brother of Micipsa. Micipsa and Mastabal were the sons of Masinissa, king of Numidia. Micipsa, who had inherited his father's kingdom, educated his nephew with his two sons Adherbal and Hiempsal; but as he saw that the former was of an aspiring disposition, he sent him with a body of troops to the assistance of Scipio, who was besieging Numantia, hoping to lose a youth whose ambition seemed to threaten the tranquillity of his children. His hopes were frustrated; Jugurtha showed himself brave and active, and he endeared himself to the Roman general. Micipsa appointed him successor to his kingdom with his two sons, but the kindness of the father proved fatal to the children. Jugurtha destroyed Hiempsal, and stripped Adherbal of his possessions, and obliged him to fly to Rome for safety. The Romans listened to the well-grounded complaints of Adherbal; but Jugurtha's gold prevailed among the senators, and the suppliant monarch, forsaken in his distress, perished by the snares of his enemy. Cæcilius Metellus was at last sent against Jugurtha; and his firmness and success soon reduced the crafty Numidian, obliging him to fly among his savage neighbours for support. Marius and Sylla succeeded Metellus, and fought with equal success. Jugurtha was at last betrayed by his father-in-law Bocchus, from whom he claimed assistance; and he was delivered into the hands of Sylla 106 years before the Christian era. He was exposed to the view of the Roman people, and dragged in chains to adorn the triumph of Marius. He was afterwards put in a prison, where he died six days after of hunger.

**JUVICA**, or **YVICA**, the name of an island in the Mediterranean. See **YVICA**.

**JUICE**, denotes the sap of vegetables, or the liquors of animals. See **ANATOMY**, **BLOOD**, **PLANTS**, **SAP**, &c.

The juices of several plants are expressed to obtain their essential salts, and for several medicinal purposes, with intention either to be used without further preparation, or to be made into syrups and extracts. The general method of extracting these juices is, by pound-

ing the plant in a marble mortar, and then by putting it into a press. Thus is obtained a muddy and green liquor, which generally requires to be clarified, as we shall soon observe. The juices of all plants are not extracted with equal ease. Some plants, even when fresh, contain so little juice, that water must be added while they are pounded, otherwise scarcely any juice would be obtained by expression. Other plants which contain a considerable quantity of juice, furnish by expression but a small quantity of it, because they contain also much mucilage, which renders the juice so viscid that it cannot flow. Water must also be added to these plants to obtain their juice. The juices thus obtained from vegetables by a mechanical method, are not, properly speaking, one of their principles, but rather a collection of all the proximate principles of plants which are soluble in water; such as the saponaceous extractive matter, the mucilage, the odoriferous principle, all the saline and saccharine substances; all which are dissolved in the water of the vegetation of the plants. Besides all these matters, the juice contains some part of the resinous substance, and the green colouring matter, which in almost all vegetables is of a resinous nature. These two latter substances, not being soluble in water, are only interposed between the parts of the other principles which are dissolved in the juice, and consequently disturbs its transparency. They nevertheless adhere together in a certain degree, and so strongly in most juices, that they cannot be separated by filtration alone. When therefore these juices are to be clarified, some previous preparations must be used by which the filtration may be facilitated. Juices which are acid, and not very mucilaginous, are spontaneously clarified by rest and gentle heat. The juices of most antiscorbutic plants abounding in saline volatile principles, may be disposed to filtration merely by immersion in boiling water; and as they may be contained in closed bottles, while they are thus heated in a water-bath, their saline volatile part, in which their medicinal qualities chiefly consist, may thus be preserved. Fermentation is also an effectual method of clarifying juices which are susceptible of it; for all liquors which have fermented, clarify spontaneously after fermentation. But this method is not used to clarify juices, because many of them are susceptible of only an imperfect fermentation, and because the qualities of most of them are injured by that process. The method of clarification most generally used, and indispensably necessary for those juices which contain much mucilage, is boiling with the white of an egg. This matter, which has the property of coagulating in boiling water, and of uniting with mucilage, does accordingly, when added to the juice of plants, unite with, and coagulate their mucilage, and separates it from the juice in form of scum, together with the greatest part of the resinous and earthy matters which disturb its transparency. And as any of these resinous matters which may remain in the liquor, after this boiling with the whites of eggs, are no longer retained by the mucilage, they may easily be separated by filtration. See **FILTRATION**.

The juices, especially before they are clarified, contain almost all the same principles as the plant itself; because in the operation by which they are extracted,

juice. no decomposition happens, but every thing remains, as to its nature, in the same state as in the plant. The principles contained in the juice are only separated from the grosser oily, earthy, and resinous parts, which compose the solid matter that remains under the press. These juices, when well prepared, have therefore the same medicinal qualities as the plants from which they are obtained. They must evidently differ from each other as to the nature and proportions of the principles with which they are impregnated, as much as the plants from which they are extracted differ from each other in those respects.

Most vegetable juices coagulate when they are exposed to the air, whether they are drawn out of the plant by wounds, or naturally run out; though what is called *naturally running out*, is generally the effect of a wound in the plant, from a sort of canker, or some other internal cause. Different parts of the same plant yield different juices. The same veins in their course through the different parts of the plant yield juices of a different appearance. Thus the juice in the root of the cow parsnip is of a brimstone colour; but in the stalk it is white.

Among these juices of vegetables which are clammy and readily coagulate, there are some which readily break with a whey. The great wild lettuce, with the smell of opium, yields the greatest plenty of milky juice of any known British plant. When the stalk is wounded with a knife, the juice flows readily out like a thick cream, and is white and ropy; but if these wounds are made at the top of the stalks, the juice that flows out of them is dashed with a purple tinge, as if cream had been sprinkled over it with a few drops of red wine. Some little time after letting this out, it becomes much more purple, and thickens; and finally, the thicker part of it separates, and the thin whey swims at top. The whey or thin part of this separated matter is easily pressed out from the curd by squeezing between the fingers, and the curd will then remain white; and on washing with water, it becomes like rags. The purple whey (for in this is contained all the colour) soon dries into a purple cake, and may be crumbled between the fingers into a powder of the same colour. The white curd being dried and kept for some time, becomes hard and brittle. It breaks with a shining surface like resin, and is inflammable; taking fire at a candle, and burning all away with a strong flame. The same thick part being held over a gentle heat, will draw out into tough long threads, melting like wax. The purple cake made from the whey is quite different from this; and when held to a candle scarce flames at all, but burns to a black coal. The whole virtue of the plant seems also to consist in this thin part of its juice: for the coagulum or curd, though looking like wax or resin, has no taste at all; whereas the purple cake made from the serum is extremely bitter, and of a taste somewhat resembling that of opium.

Of the same kind with the wild lettuce are the throatwort, spurge, and many other plants. These are all replete with a milky juice which separates into curds and whey like that already described. But this, though a common law of nature, is not universal; for there are many plants which yield the like milky juices without any separation ensuing upon their extravasation. The white juice of the fenchus never se-

parates, but dries into an uniform cake: the common red wild poppy bleeds freely with a milky juice; and the heads or capsules of seed bleed not less freely than the rest of the plant, even after the flower is fallen. This juice, on being received into a shell or other small vessel, soon changes its white to a deep yellow colour, and dries it into a cake which seems resinous and oily, but no whey separates from it. The tragopogon, or goat's beard, when wounded, bleeds freely a milky juice; it is at first white, but becomes immediately yellow, and then more and more red, till at length it is wholly of a dusky red. It never separates, but dries together into one cake; and is oily and resinous, but of an insipid taste. The great bindweed also bleeds freely a white juice; the flowers, as well as the stalks and leaves, affording this liquor. It is of a sharp taste; and as many of the purging plants are of this class, it would be worth trying whether this milk is not purgative.

These juices, as well as the generality of others which bleed from plants, are white like milk; but there are some of other colours. The juice of the greatcelandine is of a fine yellow colour; it flows from the plant of the thickness of cream, and soon dries into a hard cake, without any whey separating from it. Another yellow juice is yielded by the seed-vessels of the yellow centaury in the month of July, when the seeds are full grown. This is very clammy; it soon hardens altogether into a cake without any whey separating from it. It sticks to the fingers like birdlime, is of the colour of pale amber, and will never become harder than soft wax if dried in the shade; but if laid in the sun, it immediately becomes hard like resin. These cakes burn like wax, and emit a very pleasant smell. The great angelica also yields a yellowish juice on being wounded; and this will not harden at all, but if kept several years will still be soft and clammy, drawing out into threads or half melted resin.

Another kind of juices very different from all these, are those of a gummy nature. Some of these remain liquid a long time, and are not to be dried without the assistance of heat; the others very quickly harden of themselves, and are not inflammable. The gum of the juice of rhubarb-leaves soon hardens; and is afterwards soluble in common water, and sparkles when put into the flame of a candle. The clusters of the common honeysuckle are full of a liquid gum. This they frequently throw out, and it falls upon the leaves, where it retains its own form. The red hairs of the *ros folis* are all terminated by large bladders of a thin watery fluid. This is also a liquid gum; it sticks to the fingers, draws out into long threads, and stands the force of the sun all day. In the centre of each of these dew drops there is a small red bladder, which stands immediately on the summit of the red hair, and contains a purple juice which may be squeezed out of it. The pinguicula, or butter-wort, has also a gummy matter on its leaves in much greater quantity than the *ros folis*.

Some plants yield juices which are manifestly of an oily nature. These, when rubbed, are not at all of a clammy nature, but make the fingers glib and slippery, and do not all harden on being exposed to the air. If the stalk of elecampane be wounded, there flows

Juice  
of  
Juliar.

out an oily juice swimming upon a watery one. The stalks of the hemlock also afford a similar oily liquor swimming upon the other; and in like manner the white mullein, the berries of ivy, the bay, juniper, dog berry tree, and the fruit of the olive, when wounded, show their oil floating on the watery juice. Some of these oily juices, however, harden into a kind of resin. Our ivy yields such a juice very abundantly; and the juice of the small purple berried juniper is of the same kind, being hard and fat, and not very gummy. If the bark of the common ivy is wounded in March, there will ooze out a tough and greasy matter of a yellowish colour, which, taken up between the fingers, feels not at all gummy or sticking, but melts in handling into a sort of oil, which in process of time hardens and crusts upon the wounds, and looks like brown sugar. It burns with a lasting flame, and smells very strong. The tops of the wild lettuce, and the leaves growing near the tops, if examined with a magnifying glass, show a great number of small bladders or drops of an oily juice of a brownish colour, hardening into a kind of resin; they are easily wiped off when of any size, and are truly an oily juice a little hardened. It is probable also, that the fine blue flour or powder, called the *bloom*, upon the surface of our common plums, is no other than such an oily juice exuding from their pores in small particles, and hardening into a sort of resin.

**JUJUBES**, in the materia medica, the name of a fruit of the pulpy kind, produced on a tree which Linnaeus makes a species of rhamnus. See RHAMNUS.

The jujubes have been made a general ingredient in pectoral decoctions; but they are now seldom used on these occasions, and are scarce at all heard of in prescription, or to be met with in our shops.

**JUL**, or **JOL**, a Gothic word signifying a "sumptuous treat;" and particularly applied to a religious festival first among the heathens and afterwards among Christians. By the latter it was given to CHRISTMAS; which is still known under the name of *Iul*, or *Yool*, in Denmark, Norway, Iceland, and Sweden; nay, even in the north of Britain, and whence the month of Januarius by the Saxons was styled *Giuli*, i. e. "the Festival." As this feast had originally been dedicated by our heathen ancestors to the sun, their supreme deity; so the Christians, for the purpose of engaging the minds of their Ethnic (gentile) brethren, ordered it should be celebrated in memory of the birth of Christ: and thus it has been through ages a feast of joy and entertainment. We are indebted to Procopius for the first account of this feast.

**JULEP**, in pharmacy, a medicine composed of some proper liquor and a syrup or sugar, of extemporaneous preparation, without decoction. See PHARMACY.

**JULIAN**, the famous Roman emperor, styled the *Apostate*, because he professed the Christian religion before he ascended the throne, but afterwards openly embraced Paganism, and endeavoured to abolish Christianity. He made no use of violence, however, for this purpose; for he knew that violent measures had always rendered it more flourishing: he therefore behaved with a politic mildness to the Christians; recalled all who had been banished on account of religion under the reign of Constantius; and undertook to per-

vert them by his caresses, and by temporal advantages and mortifications covered over by artful pretences: but he forbade Christians to plead before courts of justice, or to enjoy any public employments. He even prohibited their teaching polite literature; well knowing the great advantages they drew from profane authors in their attacks upon Paganism and irreligion. Though he on all occasions showed a sovereign contempt for the Christians, whom he always called *Galileans*, yet he was sensible of the advantage they obtained by their virtue and the purity of their manners; and therefore incessantly proposed their example to the Pagan priests. At last, however, when he found that all other methods failed, he gave public employments to the most cruel enemies of the Christians, when the cities in most of the provinces were filled with tumults and seditions, and many of them were put to death: Though it has been pleaded by Julian's apologists, that the behaviour of the Christians furnished sufficient pretence for most of his proceedings against them, and the animosities among themselves furnished him with the means; that they were continually prone to sedition, and made a merit of insulting the public worship; and, finally, that they made no scruple of declaring, that want of numbers alone prevented them from engaging in an open rebellion. Historians mention, that Julian attempted to prove the falsehood of our Lord's prediction with respect to the temple of Jerusalem; and resolved to have that edifice rebuilt by the Jews, about 300 years after its destruction by Titus: but all their endeavours served only the more perfectly to verify what had been foretold by Jesus Christ; for the Jews, who had assembled from all parts to Jerusalem, digging the foundations, flames of fire burst forth and consumed the workmen. However, the Jews, who were obstinately bent on accomplishing that work, made several attempts; but it is said, that all who endeavoured to lay the foundations perished by these flames, which at last obliged them entirely to abandon the work. Julian being mortally wounded in a battle with the Persians, it is said, that he then caught in his hand some of the blood which flowed from his wound; and throwing it towards heaven, cried, "Thou Galilean hast conquered." But notwithstanding this popular report, Theodoret relates, that Julian discovered a different disposition; and employed his last moments in conversing with Maximus the philosopher, on the dignity of the soul. He died the following night, aged 32. For a particular account of his reign and exploits, see (*History of*) CONSTANTINOPLE, n<sup>o</sup> 7. 33—66

No prince was ever more differently represented by different authors; on which account it is difficult to form a true judgment of his real character. It must, however, be acknowledged, that he was learned, liberal, temperate, brave, vigilant, and a lover of justice: but, on the other hand, he had apostatised to Paganism; was an enemy to the Christian religion; and was, in fact, a persecutor, though not of the most sanguinary class. We have several of his discourses or orations; some of his letters; a treatise intitled *Misopogon*, which is a satire on the inhabitants of Antioch; and some other pieces, all written in an elegant style. They were published in Greek and Latin by father Petau in 1630 in quarto; and of which

Span-

Spanheimius gave a fine edition in folio in 1696. His most famous work was that composed against the Christians, of which there are some fragments in Cyril's refutation of it.

*Julian Period*, in chronology, a period so called, as being adapted to the Julian year.

It is made to commence before the creation of the world. Its principal advantage lies here, that the same years of the cycles of the sun, moon, and indiction, of which three cycles it was made to consist by Joseph Scaliger in 1580, belonging to any year of this period, will never fall together again till after the expiration of 7980 years. There is taken for the first year of this period that which hath the first of the cycle of the sun, the first of the cycle of the moon, and the first of the indiction cycle, and so reckoning on.

The first year of the Christian era is always, in our systems of chronology, the 4714th of the Julian period.

To find what year of the Julian period any given year of Christ answers to: To the given year of Christ add 4713, because so many years of the Julian period were expired A. D. 1; and the sum gives the year of the Julian period sought.

On the contrary, having the year of the Julian period given, to find what year of Christ answers thereto: From the year of the Julian period given subtract 4713, and the remainder will be the year sought.

**JULIAN** (St), a harbour on the south of Patagonia, in South America, where ships usually touch that are bound to the south seas. S. Lat. 48. 15.

**JULIERS**, a duchy in the circle of Westphalia, in Germany, seated between the rivers Maese and Rhine, and bounded by Prussian Guelderland on the north, by the electorate of Triers on the south, by the electorate of Cologne on the east, and by the Netherlands on the west. It is about 60 miles long, and 30 broad; and is a very plentiful country, abounding in cattle, corn, and fine meadows, and is well supplied with wood; but it is most remarkable for a fine breed of horses, and woad for dying, which is gathered here in abundance. The chief towns are Juliers, Aix-la-Chapelle, Duren, Munster-Eifel, Bedbur, Wesinburg, and Laleren. It is subject to the elector Palatine, with the consent of the kings of Prussia and Poland.

**JULIERS**, a city, capital of the duchy of Juliers in Westphalia; some think this city was founded by Julius Cæsar or Julia Agrippina; but this is much questioned by others, because it is not mentioned before Antoninus's Itinerary and Theodosius's Tables. The town is small but well fortified, and neatly built; the houses are of brick, and the streets broad and regular. The citadel is large and very strong, containing a palace of the ancient dukes, and a spacious piazza. In the suburbs there is a monastery of Carthusians, nobly endowed by several dukes of Juliers. The town is but poorly inhabited, though they have a fine woollen manufactory in this country, and likewise another of linen. It was taken by prince Maurice of Nassau in 1610, and by the Spaniards in 1622. It is seated on the river Roer, in E. Long. 6. 35. N. Lat. 50. 55.

**JULIO ROMANO**. See **ROMANO**.

**JULIUS CÆSAR**. See **CÆSAR**.

**JULIUS II.** (Julian de la Rovere), pope, remarkable for his warlike disposition, and his political negotiations: by the latter, he engaged the principal powers of Europe to league with him against the republic of Venice, called *the league of Cambrai*, signified in 1508. The Venetians having purchased peace by the cession of part of Romania, Julius turned his arms against Louis XII. king of France, and appeared in person, armed cap a-pie, at the siege of Mirandola; which place he took by assault in 1511. But proceeding to excommunicate Louis, the king wisely turned his own weapons against him, by calling a general council at Pisa: at which the pope refusing to appear, was declared to be suspended from the holy see; and Louis, in his turn, excommunicated the pope, who died soon after in 1512. He built the famous church of St Peter at Rome, and was a patron of the polite arts.

*Julius Vicus* (anc. geog.), a town of the Nemetes in Gallia Belgica; situated between the Tres Tabernæ and Noviomagus. Now *Germoesheim*, a town of the Lower Palatinate, on the west side of the Rhine. E. Long. 8. 15. Lat. 49. 12.

*Julius Pollux*. See **POLLUX**.

**JULIUS**, a son of Afcianus, born in Lavinium. In the succession to the kingdom of Alba, Æneas Sylvius, the son of Æneas and Lavinia, was preferred to him. He was, however, made chief priest.

**JULUS**, in zoology; a genus of insects of the order aptera. The feet are very numerous, being on each side twice as many as the segments of the body; the antennæ are moniliform; there are two articulated palpi; and the body is of a semicylindrical form. 1. The terrestris is a small species, having on each side 100 very short closely set feet. The body is cylindrically round, consisting of fifty segments, each of which gives rise to two pair of feet; by which means the feet stand two and two by the side of each other, so that between every two there is a little more space. Its colour is blackish, and the animal is very smooth. It is met with under stones, and in the earth. 2. The fabulosus is of an ashen-colour, smooth, and sometimes has two longitudinal bands of a dun-colour upon its back. The body is composed of about sixty segments, which appear double: one part of the segment being quite smooth, the other charged with longitudinal striæ very close-set together, which causes the cylindric body of the insect to appear intersected alternately with smooth and striated segments. Each segment gives rise to two pair of feet, which makes 240, or 120 feet on each side. These feet are slender, short, and white. The antennæ are very short, and consist of five rings. The insect, when touched, rolls itself up into a spiral; so that its feet are inwards, but yet turned towards the ground. It is found together with the preceding one, to which it bears a resemblance, though it is much larger. There are 10 other species.

**JULY**, the seventh month of the year; during which the sun enters the sign Leo. The word is derived from the Latin *Julius*, the surname of C. Cæsar the dictator, who was born in it. Mark Antony first gave this month the name *July*, which before was called *Quintilius*, as being the fifth month of the year in

Julius  
July.

Plate

July  
||  
Juncus.

the old Roman kalendar established by Romulus, which began in the month of March. For the same reason, August was called *Sextilis*; and September, October, November, and December, still retain the name of their first rank.

*Quæ sequitur, numero turba notata suo.* Ovid. Fast.

On the 19th day of this month the dog-days are commonly supposed to begin; when, according to Hippocrates and Pliny, the sea boils, wine turns sour, dogs go mad, the bile is increased and irritated, and all animals decline and languish.

*Juni-Flowers.* See DIANTHUS.

JUMIEGE, a town of Normandy in France, and in the territory of Caux, with a celebrated Benedictine abbey. It is seated on the river Seine, in E. Long. 0 55. N. Lat. 49. 25.

JUNCI LAPIDEI, in natural history, the name given by authors to a species of sessile coral, of the tubular kind, and composed of a congeries of small tubules, which are usually round and striated within. See Plate CC.

JUNCTURE, any joint or closing of two bodies. See JOINT.

JUNCTURE, in oratory, is a part of composition, particularly recommended by Quintilian and denotes such an attention to the nature of the vowels, consonants, and syllables, in the connection of words, with regard to their sound, as will render the pronunciation most easy and pleasant, and best promote the harmony of the sentence. Thus the coalition of two vowels, occasioning an hollow and obscure sound, and likewise of some consonants, rendering it harsh and rough, should be avoided; nor should the same syllable be repeated at the beginning and end of words, because the sound becomes hereby harsh and unpleasant. The following verse in Virgil's *Æneid* is an example of juncture.

*Arma virumque cano, Troja qui primus ab oris.*

JUNCUS, the RUSH, in botany: A genus of the monogynia order belonging to the hexandria class of plants; and in the natural method ranking under the 5th order, *Tripelatoideæ*. The calyx is hexaphyllous; there is no corolla; the capsule is unilocular. There are many species which are universally known, being very troublesome weeds, and difficult to be eradicated. The pith of two kinds, called the *conglomeratus* and *effusus*, or round-headed and soft rushes, are used for wicks to lamps and rush-lights\*. The *conglomeratus*, and *aculus* or marine rush, are planted with great care on the banks of the sea in Holland, in order to prevent the water from washing away the earth; which would otherwise be removed every tide, if it were not for the roots of those rushes, which fasten very deep in the ground, and mat themselves near the surface in such a manner as to hold the earth closely together. Therefore, whenever the inhabitants perceive that the roots of these rushes are destroyed, they are very assiduous in repairing them. In the summer time when the rushes are fully grown, they are cut and tied up in bundles, which are dried, and afterwards carried into the larger towns and cities, where they are wrought into baskets, and several other useful things, which are frequently sent into England. These sorts do not grow so strong in this country as on

Nº 170.

the Maese, where they sometimes arrive at the height of four feet and upwards.

A species of rush termed *juncus odoratus*, "sweet rush, or camel's hay," is sometimes brought to us from Turkey and Arabia, tied up in bundles about a foot long. The stalk, in shape and colour, somewhat resembles a barley-straw; it is full of fungous pith like that of our common rushes: the leaves are like those of wheat, and surround the stalk with several coats, as in the reed. The flowers are of a carnation colour, striped with a lighter purple. The whole plant, when in perfection, has a hot, bitterish, not unpleasant, aromatic taste, and a very fragrant smell: by long keeping it loses greatly its aromatic flavour. Distilled with water, it yields a considerable quantity of an essential oil. It was formerly often used in medicine as an aromatic, and in obstructions of the viscera, &c. but is very little employed at present.

JUNE, the sixth month of the year, during which the sun enters the sign of Cancer. The word comes from the Latin *Junius*, which some derive à *Junone*. Ovid, in the 6th of his *Fasts*, makes the goddess say,

*Junius à nostro nomine nomen habet.*

Others rather derive it à *junioribus*, this being for young people as the month of May was for old ones.

*Junius est juvenum; qui fuit antè senum.*

In this month is the summer solstice.

JUNGERMANNIA, in botany: A genus of the natural order of algæ, belonging to the cryptogamia class of plants. The male flower is pedunculated, and naked; the anthera quadrivalved: the female flower is sessile, naked, with roundish seeds. There are 29 species, all natives of Britain, growing in woods, shady places, by the sides of ditches, &c. Many of them are beautiful objects for the microscope.

JUNGIA, in botany: A genus of the polygamia segregata order, belonging to the syngenesia class of plants; the common receptacle is claspy; the perianthium three flowered; the florets tubular, two-lipped; the exterior lip ligulate; the interior one bipartite.

JUNIPERUS, the JUNIPER TREE: A genus of the monodelphia order, belonging to the monœcia class of plants; and in the natural method ranking under the 51st order, *Coniferae*. The male amentum is a calyx of scales; there is no corolla; three stamina: the female calyx tripartite; there are three petals; and as many styles; the berry is trispermous, and equal by means of three tubercles of the indurated calyx adhering to it.

*Species.* 1. The *communis*, or common juniper, grows naturally in many parts of Britain upon dry barren commons, where it seldom rises above the height of a low shrub. Mr Evelyn assures us, that "the juniper, though naturally of the growth of England, is very little known in many parts of the country: for it grows naturally only in dry, chalky, or sandy land; and, where the soil is opposite to this, the plant is rarely found. Those who have been used to see it in its wild state, on sandy barren commons, &c. will have little inducement to plant it; as there they will see it procreant, seldom showing a tendency to aspire: but when planted in a good soil, it will rise to the height of 15 or 16 feet, and produce numerous branches from

the

\* See *Rush-lights*.

perus. the bottom to the top, forming a well-looking bushy plant. These branches are exceeding tough, and covered with a smooth bark of a reddish colour, having a tinge of purple. The leaves are narrow and sharp-pointed, growing by threes on the branches: their upper surface has a greyish streak down the middle; but their under surface is of a fine green colour, and they garnish the shrub in great plenty. The flowers are small, and of a yellowish colour. They are succeeded by the berries, which are of a bluish colour when ripe." Of this species there is a variety called *Swedish juniper*, which grows 10 or 12 feet high, very branchy the whole length, with the branches growing more erect, and leaves, flowers, and fruit, like the former. But Mr Miller affirms the Swedish juniper to be a distinct species. A prostrate and very dwarfish variety is mentioned by Mr Lightfoot, under the name of *dwarf Alpine juniper*. It is frequently found in the mountains in the Highlands of Scotland, and has broader and thicker leaves than the former; the berries are also larger, or more oval than spherical. 2. The *oxycedrus*, or Spanish juniper, rises from 10 to 15 feet high, closely branched from bottom to top; having short, awl-shaped, spreading leaves by threes, and small diœcious flowers, succeeded by large reddish-brown berries. 3. The *thurifera*, or blue-berried Spanish juniper, grows 20 feet high or more, branching in a conic form, with acute imbricated leaves growing by fours, and small diœcious flowers, succeeded by large blue flowers. 4. The *Virginiana*, or Virginia cedar, grows 30 or 40 feet high, branching from bottom to top in a conic manner, small leaves by threes adhering at their base; the younger ones imbricated, and the old ones spreading; with diœcious flowers, succeeded by small blue berries. 5. The *Lycia*, Lycian cedar, or olibanum tree, grows 20 feet high, branching erect; garnished with small obtuse oval leaves, every-where imbricated; having diœcious flowers, succeeded by large oval brown berries. It is a native of Spain and Italy. 6. The *Phœnicia*, or Phœnician cedar, grows about 20 feet high, branching pyramidally; adorned with ternate and imbricated obtuse leaves; and diœcious flowers, succeeded by small yellowish berries. It is a native of Portugal. 7. The *Bermudiana*, or Bermudian cedar, grows 20 or 30 feet high, has small acute leaves by threes below, the upper ones awl-shaped, acute, and decurrent, by pairs or fours, spreading outward, and diœcious flowers, succeeded by purple berries. It is a native of Bermudas. 8. The *Salina*, or favin tree; of which there are the following varieties, viz. spreading, upright, and variegated favin. The first grows three or four feet high, with horizontal and very spreading branches; with short, pointed, decurrent, erect, opposite leaves; and diœcious flowers, succeeded by bluish berries, but very rarely producing either flowers or fruit. The second grows eight or ten feet high, with upright branches, dark-green leaves like the former, and diœcious flowers, succeeded by plenty of berries. The third has the ends of many of the shoots and young branches variegated with white, and the leaves finely striped; so that it makes a beautiful appearance. There are two other species; the *Barbadensis*, with leaves all imbricated four-ways, the younger ones ovate, the elder acute; and the *Chimensis*, with leaves decurrent imbricate-expand-

ing crowded, the stem-leaves threefold, the branch-leaves fourfold. Juniperus.

*Culture.* The propagation of all the junipers is by seed, and of the favins by layers and cuttings; but these last may also be raised from the berries, if they can be procured. They may all be sowed in beds of common light earth; except the cedar of Bermudas, which must be sowed in pots, to have shelter in winter. When the hardy kinds have had two or three years growth in the seed-bed, they may be planted out in autumn or in spring, in nursery-rows two feet asunder, there to remain till of due size for final transplantation into the shrubbery. The Bermudas cedar must be sheltered under a frame for the first year or two; when they must be separated into small pots, to be sheltered also in winter for three or four years, till they have acquired some size and strength; then turned out into pots in the full ground, where they are to remain in a warm situation; though a shelter of mats for the first winter or two during hard frosts will be of great service. The season for transplanting all the sorts is either in autumn, October, or November, or in March, and early in April.

*Uses, &c.* Juniper-berries have a strong, not disagreeable smell; and a warm, pungent, sweet taste; which, if they are long chewed, or previously well bruised, is followed by a bitterish one. The pungency seems to reside in the bark; the sweet in the juice; the aromatic flavour in oily vesicles spread through the substance of the pulp, and distinguishable even by the eye; and the bitter in the seeds. The fresh berries yield, on expression, a rich, sweet, honey-like aromatic juice; if previously pounded so as to break the seeds, the juice proves tart and bitter.—These berries are useful carminatives and stomachics: for these purposes a spirituous water and essential oil are prepared from them, and they are also ingredients in various medicines. The liquor remaining after the distillation of the oil passed through a strainer, and gently exhaled to the consistence of a rob, proves likewise a medicine of great utility, and in many cases is perhaps preferable to the oil or the berry itself. Hoffman is expressly of this opinion, and recommends the rob of juniper in debility of the stomach and intestines; and says it is particularly serviceable to old people who are subject to these disorders, or labour under a difficulty with regard to the urinary secretion. This rob is of a dark brownish-yellow colour, a balsamic sweet taste, with a little of the bitter, more or less according as the seeds in the berry have been more or less bruised. But perhaps one of the best forms under which they can be used is that of a simple watery infusion. This, either by itself or with the addition of a small quantity of gin, is a very useful drink for hydropic patients. An infusion of the tops has also been advantageously employed in the same manner. The Swedes prepare an extract from the berries, probably of the nature of the rob above mentioned, which some eat for breakfast. In Germany the berries are bruised and put into the sauce made use of for a wild boar; and are frequently also eaten with other pork, to give it a wild-boar flavour. In Carniola, and some other districts, the inhabitants make a kind of wine of them steeped in water; but it is difficult to prevent this liquor from growing sour. The Laplanders, as we are told by Linnæus, drink

Juniper.

infusions of the juniper berries as we do tea and coffee. Thrushes and grouse feed on the berries, and disseminate the seed in their dung. It is remarkable that the berries of the juniper are two years in ripening. They sometimes appear in an uncommon form; the leaves of the cup grow double the usual size, approaching, but not closing; and the three petals fit exactly close, so as to keep the air from the *cupule juniperi* which inhabit them.—The whole plant has a strong aromatic smell. The wood when burnt emits a fragrant odour like incense. It is of a reddish colour, very hard and durable; and when large enough, is used in marquetry and veneering, and in making cups, cabinets, &c. Grass will not grow beneath juniper, but this tree itself is said to be destroyed by the meadow oat. The oil of juniper mixed with that of nuts makes an excellent varnish for pictures, wood work, and preserving iron from rusting. The resin powdered and rubbed into paper prevents the ink from sinking through it, for which it is frequently used under the name of *POUNCE*.—The charcoal made from this wood endures longer than any other, inasmuch that live embers are said to have been found in the ashes after being a year covered.—For the properties of some other species, see the articles SANDARACH (*Gum*), and OLIVANUM.

JUNIUS (Adrian), one of the most learned men of the age in which he lived, was born at Horn in Holland in 1511. He travelled into all parts of Europe, and practised physic with reputation in England; where, among other works, he composed a Greek and Latin Lexicon, to which he added above 6500 words; an Epithalamium on the marriage of queen Mary with king Philip of Spain; and *Annales veteris & de Coma Commentarius*, which is the most applauded of all his works. He died in 1575.

JUVENUS (Francis), professor of divinity at Leyden, was born at Bourges in 1545, of a noble family, and studied some time at Lyons. Bartholomew Aneau, who was principal of the college in that city, gave him excellent instructions with regard to the right method of studying. He was remarkable for being proof against all temptations to lewdness; but a libertine so far overpowered him by his sophistry, that he made him an atheist; however, he soon returned to his first faith; and, averse as he was to unlawful love, he had no aversion to matrimony, but was married no less than four times. He was employed in public affairs by Henry IV.; and at last was invited to Leyden to be professor of divinity, which employment he discharged with honour, till he was snatched away by the plague in 1602. Du Pin says, he was a learned and judicious critic. He wrote, in conjunction with Emmanuel Tremellius, a Latin version of the Hebrew text of the Bible. He also published Commentaries on a great part of the Holy Scriptures; and many other works, all in Latin.

JUNIUS (Francis), or *Francis du Jon*, the son of the preceding, was born at Heidelberg in 1589. He at first designed to devote himself to a military life; but after the truce concluded in 1609, he applied himself entirely to study. He came to England in 1620, and lived 30 years in the earl of Arundel's family. He was greatly esteemed not only for his profound erudition, but also for the purity of his manners; and was

so passionately fond of the study of the northern languages, that, being informed there were some villages in Friesland where the ancient language of the Saxons was preserved, he went and lived two years in that country. He returned to England in 1675; and after spending a year at Oxford, retired to Windsor, in order to visit Vossius, at whose house he died in 1677. The university of Oxford, to which he bequeathed his manuscripts, erected a very handsome monument to his memory. He wrote, 1. *De Pictura Veterum*, which is admired by all the learned; the best edition of it is that of Rotterdam in 1694. He published the same work at London in English. 2. An explication of the old Gothic manuscript, called the *Silver* one, because the four Gospels are there written in silver Gothic letters; this was published with notes by Thomas Mareschal, or Marshall. 3. A large Commentary on the Harmony of the four Gospels by Tatian, which is still in manuscript. 4. A Glossary in five languages, in which he explains the origin of the Northern languages; published at Oxford in 1745, in folio, by Mr Edward Lee.

JUNK, in sea-language, a name given to any remnants or pieces of old cable, which is usually cut into small portions, for the purpose of making points, matts, gaskets, semit, &c.

JUNO, in pagan worship, was the sister and wife of Jupiter, and the goddess of kingdoms and riches; and also stiled the *queen of heaven*: she presided over marriage and child birth, and was represented as the daughter of Saturn and Rhea. She married Jupiter; but was not the most complaisant wife: for, according to Homer, that god was sometimes obliged to make use of all his authority to keep her in due subjection; and the same author observes, that on her entering into a conspiracy against him, he punished her by suspending her in the air with two anvils fastened to her feet, and golden manacles on her hands, which all the other deities looked on without a possibility of helping her. However, her jealousy made her frequently find opportunities of interrupting her husband in the course of his amours; and prompted her to punish with unrelenting fury Europa, Semele, Io, Latona, and the rest of his mistresses. Jupiter himself having conceived without any commerce with a female, Juno, in revenge, conceived Vulcan by the wind, Mars by touching a flower pointed out to her by the goddess Flora, and Hebe by eating greedily of lettuces.

Juno, as the queen of heaven, preserved great state: her usual attendants were Terror and Boliaets, Castor, Pollux, and 14 nymphs; but her most faithful attendant was the beautiful Iris, or the rainbow. Homer describes her in a chariot adorned with precious stones, the wheels of which were of ebony, and which was drawn by horses with reins of gold. But she is more commonly painted drawn by peacocks. She was represented in her temple at Corinth, seated on a throne, with a crown on her head, a pomegranate in one hand, and in the other a sceptre with a cuckoo on its top. This statue was of gold and ivory.

Some mythologists suppose that Juno signifies the air; others, that she was the Egyptian Isis; who being represented under various figures, was by the Greeks and Romans represented as so many distinct deities.

**JUNONALIA**, a festival observed by the Romans in honour of Juno. It was instituted on account of certain prodigies that happened in Italy, and was celebrated by matrons. In the solemnity two white cows were led from the temple of Apollo into the city thro' the gate called *Carmentalis*, and two images of Juno, made of cypress, were born in procession. Then marched 27 girls, habited in long robes, singing an hymn to the goddess; then came the Decemviri, crowned with laurel, in vestments edged with purple. This pompous company, going through the *Vicus Jugarius*, had a dance in the great field of Rome; from thence they proceeded through the *Forum Boarium* to the temple of Juno, where the victims were sacrificed by the Decemviri, and the cypress images were left standing. This festival is not mentioned in the *fasti* of Ovid, but is fully described by Livy, lib. 7. dec. 3. The hymn used upon the occasion was composed by Livius the poet.

**JUNTO**, in matters of government, denotes a select council for taking cognizance of affairs of great consequence, which require secrecy.

In Spain and Portugal, it signifies much the same with convention, assembly, or board among us: thus we meet with the junto of the three estates, of commerce, of tobacco, &c. See **BOARD**, &c.

**IVORY**, in natural history, &c. a hard, solid, and firm substance, of a white colour, and capable of a very good polish. It is the tusk of the elephant \*; and is hollow from the base to a certain height, the cavity being filled up with a compact medullary substance, seeming to have a great number of glands in it. It is observed, that the Ceylon ivory, and that of the island of Achem, do not become yellow in the wearing, as all other ivory does; for this reason the teeth of these places bear a larger price than those of the coast of Guinea.

*Hardening, Softening, and Staining, of IVORY.* See **BONES and HORNS.**

**JUPITER**, the supreme god of the ancient pagans. The theologicks, according to Cicero, reckoned up three Jupiters; the first and second of whom were born in Arcadia; of these two, the one sprang from Æther, the other from Cœlus. The third Jupiter was the son of Saturn, and born in Crete, where they pretended to show his sepulchre. Cicero in other places speaks of several Jupiters who reigned in different countries. The Jupiter, by whom the poets and divines understand the supreme god, was the son of Saturn king of Crete. He would have been devoured by his father as soon as born, had not his mother Rhea substituted a stone instead of the child, which Saturn immediately swallowed. Saturn took this method to destroy all his male children, because it had been foretold by Cœlus and Terra, that one of his sons should deprive him of his kingdom. Jupiter, being thus saved from his father's jaws, was brought up by the Curetes in a den on mount Ida. Virgil tells us, that he was fed by the bees; out of gratitude for which, he changed them from an iron to a golden colour. Some say, that his nurses were Amalthæa and Melissa, who gave him goats milk and honey; and others, that Amalthæa was the name of the goat which nourished him, and which, as a reward for her great services, was changed into a constellation. According to others, he was fed by wild pigeons, who brought

him ambrosia from Oceanus; and by an eagle, who carried nectar in his beak from a steep rock: for which he rewarded the former, by making them the foretellers of winter and summer; and the last by giving him immortality, and making him his thunder-bearer. When grown up, he drove his father out of heaven, and divided the empire of the world with his brothers. For himself, he had heaven and earth. Neptune had the sea and waters; and Pluto hell. The Titans undertook to destroy Jupiter, as he had done his father. These Titans were giants, the sons of Titan and the Earth. They declared war against Jupiter, and heaped mountains upon mountains, in order to scale heaven: but their efforts were unsuccessful. Jupiter overthrew them with his thunder, and shut them up under the waters and mountains, from which they were not able to get out.

Jupiter had several wives: the first of whom, named *Metis*, he is said to have devoured when big with child, by which he himself became pregnant; and Minerva issued out of his head, completely armed and fully grown. His second was *Themis*; the name of his third is not known; his fourth was the celebrated Juno, whom he deceived under the form of a cuckoo, which to shun the violence of a storm fled for shelter to her lap. He was the father of the Muses and Graces; and had a prodigious number of children by his mistresses. He metamorphosed himself into a satyr to enjoy Antiope; into a bull, to carry off Europa; into a swan, to abuse Leda; into a shower of gold, to corrupt Danaë; and into several other forms to gratify his passions. He had Bacchus by Semele, Diana and Apollo by Latona, and was the father of Mercury and the other gods.

The heathens in general believed that there was but one supreme God: but when they considered this one great being as influencing the affairs of the world, they gave him as many different names; and hence proceeded their variety of nominal gods. When he thundered or lightned, they called him *Jupiter*; when he calmed the sea, *Neptune*; when he guided their councils, *Minerva*; and when he gave them strength in battle, *Mars*. In process of time they used different representations of this Jupiter, &c and considered them, vulgarly at least, as so many different persons. They afterward regarded each of them in different views: e. g. The Jupiter that showered down blessings, was called the *Kind Jupiter*; and when punishing, the *Terrible Jupiter*. There was also one Jupiter for Europe, and another for Africa; and in Europe, there was one great Jupiter who was the particular friend of the Athenians, and another who was the special protector of the Romans: nay, there was scarce a town or hamlet perhaps, in Italy, that had not a Jupiter of its own; and the Jupiter of Terracina or Jupiter Aoxur, represented in medals as young and beardless, with rays round his head, more resembled Apollo than the great Jupiter at the Capitol. In this way Jupiter at length had temples and different characters almost every where: at Carthage, he was called *Ammon*; in Egypt, *Scrapis*; at Athens, the great Jupiter was the Olympian Jupiter; and at Rome the greatest Jupiter was the Capitoline Jupiter, who was the guardian and benefactor of the Romans, and whom they called the "best and greatest Jupiter;" *Jupiter optimus maximus.*

Jupiter.

*maximus.* The figure of this Jupiter was represented in his chief temple on the Capitoline hill, as sitting on a curule chair, with the fulmen or thunder, or rather lightning, in one hand, and a sceptre in the other. This fulmen in the figures of the old artists was always adapted to the character under which they were to represent Jupiter. If his appearance was to be mild and calm, they gave him the conic fulmen or bundle of flames wreathed close together, held down in his hand: When punishing, he holds up the same figure, with two transverse darts of lightning, sometimes with wings added to each side of it, to denote its swiftness; this was called by the poets the three-forked bolt of Jove: and when he was going to do some exemplary execution, they put in his hand a handful of flames, all let loose in their utmost fury; and sometimes filled both his hands with flames. The superiority of Jupiter was principally manifested in that air of majesty which the ancient artists endeavoured to express in his countenance: particular attention was paid to the head of hair, the eye-brows, and the beard. There are several heads of the mild Jupiter on ancient seals; where his face has a mixture of dignity and ease in it, admirably described by Virgil, *Æn.* i. v. 256. The statues of the Terrible Jupiter were generally of black marble, as those of the former were of white: the one sitting with an air of tranquillity; the other standing, more or less disturbed. The face of the one is pacific and serene; of the other angry or clouded. On the heads of the one the hair is regular and composed: in the other it is so discomposed, that it falls half-way down the forehead. The face of the Jupiter Tonans resembles that of the Terrible Jupiter; he is represented on gems and medals as holding up the triple bolt in his right hand, and standing in a chariot, which seems to be whirled on impetuously by four horses. Thus he is also described by the poets. Ovid. *Deian.* Herc. v. 28. Horace lib. i. od. 4. v. 8. Jupiter, as the intelligence, presiding over a single planet, is represented only in a chariot and pair: on all other occasions, if represented in a chariot, he is always drawn by four horses. Jupiter is well known as the chief ruler of the air, whose particular province was to direct the rains, the thunders, and the lightnings. As the dispenser of rain, he was called *Jupiter Pluvius*: under which character he is exhibited seated in the clouds, holding up his right hand, or extending his arms almost in a straight line each way, and pouring a stream of hail and rain from his right hand upon the earth; whilst the fulmen is held down in his left. The wings that are given him relate to his character of presiding over the air: his hair and beard in the Antonine pillar are all spread down by the rain, which descends in a sheet from him, and falls for the refreshment of the Romans; whilst their enemies are represented as struck with the lightnings, and lying dead at their feet.

Some consider a great part of the fable of Jupiter to include the history of Noah and his three sons; and that Saturn is Noah, who saw all mankind perish in the waters of the deluge; and who, in some sort, swallowed them up, by not receiving them into the ark. Jupiter is Ham; Neptune Japheth; and Shem, Pluto.

The Titans, it is thought, represent the old giants, who built the tower of Babel, and whose pride an

presumption God had confounded, by changing their language, and pouring out the spirit of discord and division among them. The name of *Jupiter*, or *Jovis Pater*, is thought to be derived from Jehovah, pronounced with the Latin termination *Jovis* instead of *Jova*; and in medals we meet with *Jovis* in the nominative, as well as oblique cases: for example *Jovis custos*, *Jovis propugnator*, *Jovis stator*. To the name *Jovis* was added *pater*; and afterwards instead of "*Jovis pater*", *Jupiter* was used by abbreviation.

The name *Jupiter* was not known to the Hebrews till the reign of Alexander the Great, and the kings his successors. Antiochus Epiphanes commanded the idol of Jupiter Olympius to be placed in the temple at Jerusalem; and that of Jupiter the defender of strangers in the temple on mount Gerizim. 2 Macc. vi. 2. While St Paul and St Barnabas were at Lystra, they were taken for gods, because they cured one who had been lame from his birth, and that by an expression only: St Paul was taken for Mercury, by reason of his eloquence; and St Barnabas for Jupiter (*Acts* xiv. 11, 12.), on account probably of his good mein.

JUPITER, ♃, in astronomy, one of the superior planets, remarkable for its brightness; and which by its proper motion seems to revolve round the earth in about twelve years. See *ASTRONOMY-Index*.

JURA, one of the Hebrides, or Western Islands of Scotland, lying opposite to Knapdale in Argyleshire, is supposed to be about 34 miles long and 10 broad. It is the most rugged of all the Hebrides; and is composed chiefly of vast mountains, naked, and without a possibility of cultivation. Some of the south and western sides only are improveable, and in good seasons as much bear and oats are raised as will maintain the inhabitants; though by the distillation, as Mr Pennant supposes, of their grain, they sometimes want. Bear produces four or five fold, and oats three fold. Sloes are the only fruits of the island. An acid for punch is here made from the berries of the mountain-ash; and a kind of spirit is also distilled from them. Necessity hath instructed the inhabitants in the use of native dyes. Thus the juice of the tops of heath boiled supplies them with a yellow; the roots of the white water-lily with a dark-brown; those of the yellow water iris with a black; and the galium verum, *ru* of the islanders, with a very fine red, not inferior to madder. On the hills is some pasture for cattle; and the produce, when Mr Pennant visited the island, amounted to about 300 or 400 head of black cattle, sold annually at 3*l.* each to graziers who come for them; about 100 horses also sold annually; a few sheep with fleeces of a most excellent quality, and great numbers of goats. The other animals of Jura are about 100 stags; though these must formerly have been much more numerous, as the original name of the island was *Deir-ay*, or the *isle of deer*, so called by the Norwegians on account of the abundance of deer found in it. Here also Mr Pennant had some obscure account of a worm that, in a less pernicious degree, resembles the *FURIA infernalis* of Linnaeus. The *fillan*, a little worm of Jura, small as a thread, and not an inch in length, inuatuates itself under the skin, causes a redness and great pain, flies swiftly from place to place; but is cured by a poultice of cheefe and honey. Of the mountains of Jura, those

Jupit  
Jur

from

from their shape called the *paps*, are the most remarkable. There are only three very large ones; the biggest, called *Beinn-an-oir*, or the mountain of gold, lies farthest to the north; the second is called *Beinn-sheunta*, or the halloved mountain; and the third, *Beinn-a-chaolis*, or the mountain of the found, is the least of the three. Mr Pennant ascended the first with great labour and difficulty. It is composed of vast stones, covered with mosses near the base; but all above bare and unconnected with each other. The whole, he says, seems a *cairn*, the work of the sons of Saturn. The grandeur of the prospect from the top abundantly made amends for the fatigue of ascending the mountain. Jura itself afforded a stupendous scene of rock, varied with innumerable little lakes. From the west side of the hill ran a narrow stripe of rock terminating in the sea, and called the *slide of the old bag*. To the south appeared Ilay extended like a map beneath his feet; and beyond that the north of Ireland; to the east two other islands, Cantyre, Arran, and the frith of Clyde bounded by Ayrshire; an amazing tract of mountains to the north-east as far as *Ben-lomond*; *Skarba* finished the northern view; and over the western ocean were scattered Colonsay and Oransay, Mull, Iona, and its neighbouring isles; and still further, the long extents of Tirey and Col, just apparent. The other paps are seen very distinctly, but all of them inferior in height. Mr Banks and his friends mounted that to the south, and found the height to be 2359 feet; but this is far overtopped by *Beinn-an-oir*. The stones of this mountain are white, a few red, quartz, and composed of small grains; but some are *brecciated* or filled with crystalline kernels of an amethystine colour. The other stones of the island are, a cinerous slate, veined with red, and used here as a white-stone; a micaceous sand-stone; and between the small isles and Atfin, a micaceous quartz rock-stone. On the west side of the island there is an anchoring-place called *Whisfarlan*; towards the north end is a bay called *Da'l yaul*; and on the same coast is formed another riding-place for vessels among several small islands. Between the north end of Jura and the small isle of Skarba, there is a famous whirlpool, called *Cory-Vrekan*, from Breacan, son to a king of Denmark, who perished in this gulph. His body being cast ashore on the north side of Jura, was buried in a cave, and his grave is still distinguished by a tombstone and altar. In this vortex, which extends about a mile in breadth, the sea begins to boil and ferment with the tide of flood, increasing gradually to a number of whirlpools, which, in the form of pyramids, spout up the water with a great noise, as high as the mast of a small vessel, agitated into such a foam as makes the sea appear white even at the distance of two leagues. About half flood the violence begins to decrease, and continues to do so till about half an hour after high-water: then it boils as before, till within an hour of low-water, when the smallest fishing-boat may cross it without danger.

Jura is furnished with many rivulets and springs of excellent water, and the air is remarkably healthy; its salubrity being increased by the high situation, perpetually fanned by breezes. It is, however, but ill-peopled; and did not contain above 700 or 800 inhabitants at the time it was visited by Mr Pennant. The women are prolific, and very often bear twins. The

inhabitants live to a great age, and are liable to few distempers. Men of 90 can work; and there was then living a woman of 80, who could run down a sheep. The inhabitants are all Protestants, but addicted to some superstitions. The parish is supposed to be the largest in Great Britain, and the duty the most dangerous and troublesome: it consists of Jura, Oransay, Colonsay, Skarba, and several little isles divided by narrow and dangerous foulds; forming a length of not less than 60 miles; supplied by only one minister and an assistant.

The very old clans of Jura are the *Mac-ilvays* and the *Mac-raines*: but it seems to have changed masters more than once. In 1549, Donald of Cantyre, Mac-guillayne of Doward, Mac-guillayne of Kinloch-buy, and Mac-duffie of Colonsay, were the proprietors: Mac-lean of Mull had also a share in 1586. At present it belongs to the duke of Argyle, Mr Macneil of Colonsay, and Mr Campbell of Shawfield.

JURA is also the name of a chain of mountains in Switzerland, beginning in the canton of Zurich, extending from thence along the Rhine into the canton and bishopric of Basle, stretching into the canton of Soleura and the principality of Neuchatel, and branching out towards the Pays de Vaud; separating that county from Frenche Comte and Burgundy, and continued beyond the Genevan territories as far as the Rhone. Many elevated valleys are formed by different parts of this chain in the country of the Pays de Vaud; among which one of the most remarkable is the valley of the lake of Joux, on the top of that part of the chain named Mount Joux. It contains several populous villages, and is beautifully diversified with wood, arable land, and pasture. It is watered by two lakes; the largest of which is that of Joux already mentioned. This has one shore of a high rock covered with wood; the opposite banks forming a gentle ascent, fertile and well cultivated; behind which is a ridge covered with pines, beech, and oak wood. The smaller lake, named *Brenet*, is bordered with fine corn-fields and villages; and the stream which issues from it is lost in a gulf named *Entonnoir*, or the *Funnel*, where the people have placed several mills which are turned by the force of the falling current. The river Orbe issues from the other side of the mountain, about two miles from this place; and probably owes its origin to the subterraneous stream just mentioned. The largest lake is supplied by a rivulet which issues from the bottom of a rock, and loses itself in it. The valley contains about 3000 inhabitants, remarkable for their industry. Some are watch makers; but the greatest number employ themselves in polishing crystals, granites, and marcasites. The country is much infested with bears and wolves. In ascending to this place there is a very extensive prospect of great part of the Pays de Vaud, the lake of Geneva, and that of Neuchatel, which from that high point of view appear to be nearly on a level; though M. de Luc found the latter to be 159 feet above the level of the lake of Geneva.

JURATS, JURATI, magistrates in the nature of ALDERMEN, for the government of several corporations. Thus we meet with the mayor and jurats of Maidstone, Rye, Winchelsea, &c.—So also Jersey has a bailiff and twelve jurats, or sworn assistants, to govern the island.

Jura,  
Jurats.

IVREA  
||  
Juriscon-  
sultus.

IVREA, an ancient and strong town of Italy, in Piedmont, and capital of Canaveze, with a strong fort, a bishop's see, the title of a marquisate, and an ancient castle. It is subject to the king of Sardinia, and feated on the river Doria between two hills, in E. Long. 7. 48. N. Lat. 45. 12.

JURIEU (Peter), an eminent French Protestant divine, called ironically by the papists the *Goliath* of the Protestants, was born in 1637. He was educated in England under his maternal uncle Peter du Moulin, and took orders in the English church; but returning to succeed his father as pastor of a reformed congregation at Mer in the diocese of Blois, he was made professor of divinity and Hebrew at Sedan, where he acquired great reputation. This university being taken from the Protestants, a professorship of divinity was founded for him at Rotterdam; and he was also appointed minister of the Walloon church in the same town. Being now in a place of liberty, he gave full scope to an imagination naturally warm, and applied himself to study the book of Revelation, of which he fancied he had by a kind of inspiration discovered the true meaning; a notion that led him to many enthusiastic conjectures. He was moreover so unfortunate as to quarrel with his best friends for opposing his visionary opinions, which produced violent disputes between him and Messrs Bayle and de Beauval. He died in 1713; and left a great number of esteemed works behind him.

JURIN (Dr James), a distinguished person, who cultivated medicine and mathematics with equal success. He was secretary of the Royal Society in London, as well as president of the College of Physicians there. He had great disputes with Michellotti upon the moment of running-waters, with Robins upon distinct vision, and with the partizans of Leibnitz upon moving bodies. A treatise of his "upon Vision" is printed in Smith's "Optics." He died in 1750.

JURISCON-ULTUS (*Ictus*,) among the Romans, was a person learned in the law; a master of the Roman jurisprudence; who was consulted on the interpretation of the laws and customs, and on the difficult points in law-suits. The fifteen books of the Digests were compiled wholly from the answers or reports of the ancient jurisconsulti. Tribonianus, in destroying the 2000 volumes from whence the code and Digest were taken, has deprived the public of a world of things which would have given them light into the ancient office of the jurisconsulti. We should scarce have known any thing beyond their bare names, had not Pomponius, who lived in the second century, taken care to preserve some circumstances of their office.

The Roman jurisconsulti seem to have been the same with our chamber-counsellors, who arrived at the honour of being consulted through age and experience, but never pleaded at the bar. Their pleading advocates or lawyers never became jurisconsulti. See ADVOCATE.

In the times of the commonwealth, the advocati had by much the more honourable employment, as being in the ready way to attain the highest preferments. They then despised the jurisconsulti, calling them in derision *formularii* and *legulei*, as having invented certain forms and monosyllables, in order to give their

answers the greater appearance of gravity and mystery. Jurisconsulti But in process of time they became so much esteemed, that they were called *prudentes* and *sapientes*, and the emperors appointed the judges to follow their advice. Augustus advanced them to be public officers of the empire; so that they were no longer confined to the petty counsels of private persons.—Bern. Rutilius has written the lives of the most famous jurisconsulti who have lived within these 2000 years.

JURISDICTION, a power or authority, which a man has to do justice in cases of complaint made before him. There are two kinds of jurisdiction, the one *ecclesiastical*, the other *secular*.

*Secular JURISDICTION*, belongs to the king and his justices or delegates. The courts and judges at Westminster have jurisdiction all over England, and are not restrained to any county or place; but all other courts are confined to their particular jurisdictions, which if they exceed, whatever they do is erroneous. There are three sorts of inferior jurisdictions; the first is *teneré placita*, to hold pleas, and the plaintiff may sue either there or in the king's courts. Another is the consanguine of pleas, where a right is invested in the lord of the franchise to hold pleas; and he is the only person that can take advantage of it, by claiming his franchise. The third sort is an exempt jurisdiction, as where the king grants to some city, that the inhabitants shall be sued within their city and not elsewhere; though there is no jurisdiction that can withstand a *certiorari* to the superior courts.

*Ecclesiastical JURISDICTION* belongs to bishops and their deputies.

Bishops, &c. have two kinds of jurisdiction; the one *internal*, which is exercised over the conscience in things purely spiritual; and this they are supposed to hold immediately of God.

The other is *contentious*, which is a privilege some princes have given them in terminating disputes between ecclesiastics and laymen.

JURISPRUDENCE, the science of what is just or unjust; or the knowledge of laws, rights, customs, statutes, &c. necessary for the administration of justice. See LAW.

JUROR, JURATOR, in a legal sense, is one of those twenty-four or twelve men who are sworn to deliver truth upon such evidence as shall be given them touching any matter in question. The punishment of petty jurors attainted of giving a verdict contrary to evidence, willingly, is very severe.

JURY, a certain number of men sworn to enquire into and try a matter of fact, and to declare the truth upon such evidence as shall appear before them.

Juries are, in these kingdoms, the supreme judges in all courts and in all causes in which either the life, property, or reputation, of any man is concerned: this is the distinguishing privilege of every Briton, and one of the most glorious advantages of our constitution; for as every one is tried by his peers, the meanest subject is as safe and as free as the greatest. See the article TRIAL.

*Jury-Mast*, whatever is set up in room of a mast that has been lost in a storm or an engagement, and to which a lesser yard, ropes, and sails, are affixed.

JUS CORONÆ. See HEREDITARY Right, and SUCCESSION.

*Jus Deliberandi*, in Scots law, that right which an heir has by law of deliberating for a certain time whether he will represent his predecessor.

*Jus D. volatum*, in Scots law, the right of the church, of presenting a minister to a vacant parish in case the patron shall neglect to use that right within the time limited by law.

*Jus Mariti*, in Scots law, the right the husband acquires to his wife's moveable estate, in virtue of the marriage.

*Jus Reditus*, in Scots law, the right the wife has in the goods in communion, in case of the previous decease of the husband.

*Jus Precedentis*, in Scots law, the preferable right of jurisdiction acquired by a court, in any cause to which other courts are equally competent, by having exercised the first act of jurisdiction.

*Jus Civile*, amongst the Romans, signified no more than the interpretation given by the learned, of the laws of the twelve tables, though the plebs now extends to the whole system of the Roman laws.

*Jus Civitatis*, signifies freedom of the city of Rome, which intitled those persons who had obtained it to most of the privileges of Roman citizens,—yet it differs from *Jus Quiritium*, which extended to all the advantages which a free native of Rome was intitled to—the difference is much the same as betwixt *denization* and *naturalization* with us.

*Jus Honorarium*, was a name given to those Roman laws which were made up of edicts of the supreme magistrates, particularly the *prætors*.

*Jus Imaginis*, was the right of using pictures and statues amongst the Romans, and had some resemblance to the right of bearing a coat-of-arms amongst us. This honour was allowed to none but those whose ancestors or themselves had borne some *civile office*, that is, had been *Curule Aedile, Consul, Prætor, or Consul*.

The use of statues, &c. which the *Jus Imaginis* gave, was the exhibiting them in funeral processions, &c. See IMAGE.

*Jus Papirianum*, was the laws of Romulus, Numa, and other kings of Rome, collected into a body by Sextus Papirius, who lived in the time of Tarquin the Proud, which accounts for the name.

*Jus Trium Liberorum* was a privilege granted to such persons in the city of Rome as had three children, by which they were exempted from all troublesome offices. The same exemption was granted to any persons who lived in other parts of Italy, having four children: and those that lived in the provinces, provided they had five (or as some say seven) children, were intitled to the same immunities. This was good policy, and tended to the population of the empire. For a further account of these privileges, See CHILDREN.

JUSSICA, in botany: A genus of the monogynia order, belonging to the decandria class of plants; and in the natural method ranking under the 17th order, *Calycanthemæ*. The calyx is quadripartite or quinquepartite superior; there are four or five petals; the capsule quadrilocular or quinquelocular, oblong, opening at the angles; the seeds are numerous and small.

JUST, a sportive kind of combat on horseback, man against man, armed with lances. The word is by

some derived from the French *juste*, of the Latin *justus*, because the combatants fought near one another. Salmasius derives it from the modern Greek *zoutra*, or rather *zoutra*, which is used in this sense by Neophorus Gregorius. Others derive it from *justa*, which in the corrupt age of the Latin tongue was used for this exercise, by reason it was supposed a more just and equal combat than the tournament.

The difference between juts and tournaments consists in this, that the latter is the genus, of which the former is only a species. Tournaments included all kinds of military sports and engagements made out of gallantry and diversion: juts were those particular combats where the parties were near each other, and engaged with lance and sword. Add that the tournament was frequently performed by a number of cavaliers, who fought in a body: The jut was a single combat of one man against another.—Though the juts were usually made in tournaments after a general encounter of all the cavaliers, yet they were sometimes singly, and independent of any tournament. See TOURNAMENT.

He who appeared for the first time at a jut, forfeited his helm or casque unless he had forfeited before at a tournament.

JUSTEL (Christopher), a learned counsellor, and secretary to the French king, was born at Paris in 1580, and applied himself to the study of ecclesiastical history. He maintained a correspondence with the most learned men of his time, as archbishop Usher, Sir Henry Spelman, Blondel, &c. till his death, which happened in 1649. He wrote, 1. The code of the canons of the church universal, and the councils of Africa, with notes. 2. A genealogical history of the house of Auvergne. And, 3. Collections of Greek and Latin canons, from several manuscripts, which formed the *Bibliotheca juris canonici veteris*, published in 2 vols folio, by William Voet and our author's son.

JUSTEL (Henry), son of the foregoing, was born at Paris in 1620. He became secretary and counsellor to the king; and was as distinguished for his own learning as remarkable for encouraging it in others. He came to London in 1681, on the persecution of the Protestants; and was made keeper of the royal library at St James's: which office he held till his death in 1693, when he was succeeded by the famous Dr Bentley. He wrote several books, the titles of which may be seen in the catalogue of the Bodleian library.

JUSTICE, in a moral sense, is one of the four cardinal virtues, which gives every person his due.

Civilians distinguish justice into two kinds; *communicative* and *distributive*. The former establishes fair dealing in the natural commerce between man and man; and includes sincerity in our discourse, and integrity in our dealings. The effect of sincerity is mutual confidence: necessary among the members of the same community; and this mutual confidence is sustained and preserved by the integrity of our conduct.

*Distributive* justice is that by which the differences of mankind are decided, according to the rules of equity. The former is the justice of private individuals; the latter of princes and magistrates.

Fidelity and truth are the foundation of justice. As

Justel,  
Justice.

Justice. to be perfectly just is an attribute of the Divine Nature, to be so to the utmost of our ability is the glory of man.

The following examples of this virtue are extracted from various authors.

1. Among the several virtues of Aristides, that for which he was most renowned was justice; because this virtue is of most general use, its benefits extending to a greater number of persons, as it is the foundation, and in a manner the soul, of every public office and employment. Hence it was that Aristides, though in low circumstances, and of mean extraction, obtained the glorious surname of the *Just*; a title, says Plutarch, truly royal, or rather truly divine: but of which princes are seldom ambitious, because generally ignorant of its beauty and excellency. They choose rather to be called the conquerors of cities and the thunderbolts of war, preferring the vain honour of pompous titles, which convey no other idea than violence and slaughter, to the solid glory of those expressive of goodness and virtue. How much Aristides deserved the title given him, will appear in the following instances; though it ought to be observed, that he acquired it not by one or two particular actions, but by the whole tenor of his conduct.

Themistocles having conceived the design of supplanting the Lacedemonians, and of taking the government of Greece out of their hands, in order to put it into those of the Athenians, kept his eye and his thoughts continually fixed upon that great project; and as he was not very nice or scrupulous in the choice of his measures, whatever tended towards the accomplishing of the end he had in view he looked upon as just and lawful.

On a certain day then he declared in a full assembly of the people, that he had a very important design to propose; but that he could not communicate it to the people, because its success required it should be carried on with the greatest secrecy: he therefore desired they would appoint a person to whom he might explain himself upon the matter in question. Aristides was unanimously fixed upon by the whole assembly, who referred themselves entirely to his opinion of the affair; so great a confidence had they both in his probity and prudence. Themistocles, therefore, having taken him aside, told him that the design he had conceived was to burn the fleet belonging to the rest of the Grecian states, which then lay in a neighbouring port; and by this means Athens would certainly become mistress of all Greece. Aristides hereupon returned to the assembly, and only declared to them that indeed nothing could be more advantageous to the commonwealth than Themistocles's project, but that at the same time nothing in the world could be more unjust. All the people unanimously ordained that Themistocles should entirely desist from his project.

There is not perhaps in all history a fact more worthy of admiration than this. It is not a company of philosophers (to whom it costs nothing to establish fine maxims and sublime notions of morality in the school) who determine on this occasion that the consideration of profit and advantage ought never to prevail in preference to what is honest and just; but the whole people who are highly interested in the proposal made to

them, that are convinced it is of the greatest importance to the welfare of the state, and who, however, reject it with unanimous consent, and without a moment's hesitation; and for this only reason, that it is contrary to justice. How black and perfidious, on the other hand, was the design which Themistocles proposed to them, of burning the fleet of their Grecian confederates at a time of entire peace, solely to aggrandize the power of the Athenians! Had he an hundred times the merit ascribed to him, this single action would be sufficient to fully all his glory; for it is the heart, that is to say, integrity and probity, which constitutes and distinguishes true merit.

2. The government of Greece having passed from Sparta to the Athenians, it was thought proper under this new government to lodge in the island of Delos the common treasure of Greece; to fix new regulations with regard to the public money; and to lay such a tax as might be regulated according to the revenue of each city and state, in order that the expences being equally borne by the several individuals who composed the body of the allies, no one might have reason to murmur. The difficulty, was to find a person of so honest and incorrupt a mind, as to discharge faithfully an employment of so delicate and dangerous a kind, the due administration of which so nearly concerned the public welfare. All the allies cast their eyes on Aristides; accordingly they invested him with full powers, and appointed him to levy a tax on each of them, relying entirely on his wisdom and justice. The citizens had no cause to repent their choice. He presided over the treasury with the fidelity and disinterestedness of a man who looks upon it as a capital crime to embezzle the smallest portion of another's possessions, with the care and activity of a father of a family in the management of his own estate, and with the caution and integrity of a person who considers the public moneys as sacred. In fine, he succeeded in what is equally difficult and extraordinary, viz. to acquire the love of all in an office in which he who escapes the public odium gains a great point. Such is the glorious character which Seneca gives of a person charged with an employment of almost the same kind, and the noblest eulogium that can be given to such as administer public revenues. It is the exact picture of Aristides. He discovered so much probity and wisdom in the exercise of this office, that no man complained; and those times were considered ever after as the golden age; that is, the period in which Greece had attained its highest pitch of virtue and happiness.

While he was treasurer-general of the republic, he made it appear that his predecessors in that office had cheated the state of vast sums of money, and among the rest Themistocles in particular; for this great man, with all his merit, was not irreproachable on that head; for which reason, when Aristides came to pass his account, Themistocles raised a mighty faction against him, accused him of having embezzled the public treasure, and prevailed so far as to have him condemned and fined. But the principal inhabitants, and the most virtuous part of the citizens, rising up against so unjust a sentence, not only the judgment was reversed and the fine remitted, but he was elected treasurer a-

gain for the year ensuing. He then seemed to repent of his former administration; and by showing himself more tractable and indulgent towards others, he found out the secret of pleasing all that plundered the commonwealth: for as he neither reproved them nor narrowly inspected their accounts, all these plunderers, grown fat with spoil and rapine, now extolled Aristides to the skies. It would have been easy for him, as we perceive, to have enriched himself in a post of that nature, which seems, as it were, to invite a man to it by the many favourable opportunities it lays in his way; especially as he had to do with officers, who for their part were intent upon nothing but robbing the public, and would have been ready to conceal the frauds of the treasurer their master upon condition he did them the same favour. These very officers now made interest with the people to have him continued a third year in the same employment: but when the time of election was come, just as they were on the point of electing Aristides unanimously, he rose up, and warmly reproved the Athenian people: "What (says he), when I managed your treasure with all the fidelity and diligence an honest man is capable of, I met with the most cruel treatment, and the most mortifying returns; and now that I have abandoned it to the mercy of these robbers of the republic, I am an admirable man and the best of citizens! I cannot help declaring to you, that I am more ashamed of the honour you do me this day, than I was of the condemnation you passed against me this time twelvemonth; and with grief I find that it is more glorious with us to be complaisant to knaves than to save the treasures of the republic." By this declaration he silenced the public plunderers and gained the esteem of all good men.

3. In the Universal History we meet with the following remarkable instance of a scrupulous regard to justice in a Persian king named Nouchirvan. Having been out a-hunting, and desirous of eating some of the venison in the field, several of his attendants went to a neighbouring village and took away a quantity of salt to season it. The king suspecting how they had acted, ordered that they should immediately go and pay for it. Then turning to his attendants, he said, "This is a small matter in itself, but a great one as it regards me: for a king ought ever to be just, because he is an example to his subjects; and if he swerves in trifles, they will become dissolute. If I cannot make all my people just in the smallest things, I can at least show them it is possible to be so."

These examples, to which many more might be added, are highly pleasing to a sagacious and virtuous mind; but the sensual and brutal part of mankind, who regard only the present moment, who see no objects but those which fall under the cognizance of the corporeal eye, and estimate the merit of every action by the gain which it produces, have always considered justice and utility as independent of each other. They put utility in the balance against honesty every day; and never fail to incline the beam in favour of the former, if the supposed advantage is thought to be considerable. They have no regard to justice but as they reckon to gain by it, or at least not to lose; and are always ready to desert it when it exposes them to any danger or threatens them with any loss. From this

disposition of mind proceeds that avidity of wealth and that habitual fraud which perpetually embroil civil society: from this fatal source arises that deluge of iniquity which has overflowed the world; from this preference of interest to honesty proceed every unjust litigation and every act of violence. And yet nothing is more certain than that "Whatever is unjust must, upon the whole, be disadvantageous;" which might be proved thus:

Nothing is advantageous or useful but that which has a tendency to render us happy: the highest advantage, or absolute utility, is complete happiness; and to this happiness, whatever is advantageous or useful is relative as to an ultimate end; and nothing that is not thus relative to happiness can properly be said to be advantageous or useful. But whatever is unjust, so far from tending to promote, that it destroys our happiness; for whatever is unjust is contrary to the Divine will: but it is not possible that we should become happy by resisting that will; because of this will our happiness is the immediate object. God is not a tyrant, proud of incontrollable power, who imposes capricious laws only as tests of our obedience, and to make us feel the weight of his yoke; all his precepts are lessons which teach us how to be happy. But it is the will of God that we should be just; from whence it follows, that no true happiness can be acquired by those who are unjust. An action, therefore, which is contrary to the will of God, must be inconsistent with our true interest; and consequently, so far from being useful or expedient, it must inevitably produce ruin and misery. Injustice sometimes meets with the punishment it deserves in this world; but if it should escape here, it does not follow that it will for ever escape. It proves, on the contrary, that there is another world in which the fates of mankind will be impartially decided.

But to prevent the dreadful confusion which the mistaken notion of interest had introduced among mankind, it became necessary to have recourse to the innate principles of justice; to suspend the balance and display the sword, for the determination of differences and the punishment of guilt. This is the reason and origin of distributive justice, which became the necessary appendage of sovereignty. Accordingly in ancient times, princes administered justice in person and without delay; but at length being embarrassed and oppressed by the multiplicity of business which increased with their dominions, or diverted from their attention to civil government by the command of armies, certain laws were established with great solemnity to adjust and determine the differences which might arise among the members of the same community, and to repress the insolence of those who dared to violate the public peace, by possessing them with the dread either of corporeal punishment or infamy. The execution of these laws was put into the hands of subordinate judges. These delegates of the sovereign power were called magistrates; and these are the persons by whom justice is at this time administered, except in particular cases, in which the sovereign himself interferes. But by whomsoever this kind of justice is administered, it ought to be done speedily, impartially, and without expence to the parties.

4. Aristides being judge between two private persons,

Justice.

sons, one of them declared, that his adversary had greatly injured Aristides. "Relate rather, good friend (said he, interrupting him), what wrong he hath done thee; for it is thy cause, not mine, that I now sit judge of."—Again: Being desired by Simonides, a poet of Chios, who had a cause to try before him, to stretch a point in his favour, he replied, "As you would not be a good poet if your lines ran contrary to the just measures and rules of your art; so I should neither be a good judge nor an honest man if I decided aught in opposition to law and justice."

5. Artabazanes, an officer of Artaxerxes king of Persia, begged his majesty to confer a favour upon him; which if complied with would be an act of injustice. The king being informed that the promise of a considerable sum of money was the only motive that induced the officer to make so unreasonable a request, ordered his treasurer to give him thirty thousand daries, being a present of equal value with that which he was to have received. Giving him the order for the money, "Here, take (says the king) this token of my friendship for you: a gift of this nature cannot make me poor; but complying with your request would make me poor indeed, for it would make me unjust."

6. Cambyfes king of Persia was remarkable for the severity of his government and his inexorable regard to justice. This prince had a particular favourite whom he made a judge; and this judge reckoned himself so secure in the credit he had with his master, that without any more ado causes were bought and sold in the courts of judicature as openly as provisions in the market. But when Cambyfes was informed of these proceedings, enraged to find his friendship so ungratefully abused, the honour of his government prostituted, and the liberty and property of his subjects sacrificed to the avarice of his wretched minion, he ordered him to be seized and publicly degraded; after which he commanded his skin to be stripped over his ears, and the seat of judgment to be covered with it as a warning to others. At the same time, to convince the world that this severity proceeded only from the love of justice, he permitted the son to succeed his father in the honours and office of prime minister.

7. When Charles duke of Burgundy, surnamed the *Bold*, reigned over spacious dominions, now swallowed up by the power of France, he heaped many favours and honours upon Claudius Rynfault, a German, who had served him in his wars against the insults of his neighbours. The prince himself was a person of singular humanity and justice; and being prepossessed in favour of Rynfault, upon the decease of the governor of the chief town of Zealand gave him that command. He was not long seated on that government before he cast his eyes upon Sapphira, a woman of exquisite beauty, the wife of Paul Danvelt, a wealthy merchant of the city, under his protection and government. Rynfault was a man of a warm constitution, and violent inclination to women. He knew what it was to enjoy the satisfactions which are reaped from the possession of beauty; but was an utter stranger to the decencies, honours, and delicacies, that attend the passion toward them in elegant minds. He could with his tongue utter a passion with which his heart was wholly untouched. In short, he was

one of those brutal minds which can be gratified with the violation of innocence and beauty, without the least pity, passion, or love for that with which they are so much delighted.

Rynfault being resolved to accomplish his will on the wife of Danvelt, left no arts untried to get into a familiarity at her house; but she knew his character and disposition too well not to shun all occasions that might ensnare her into his conversation. The governor, despairing of success by ordinary means, apprehended and imprisoned her husband, under pretence of an information that he was guilty of a correspondence with the enemies of the duke to betray the town into their possession. This design had its desired effect; and the wife of the unfortunate Danvelt, the day before that which was appointed for his execution, presented herself in the hall of the governor's house, and as he passed through the apartment threw herself at his feet, and holding his knees, beseeched his mercy. Rynfault beheld her with a dissembled satisfaction; and assuming an air of thought and authority, he bid her rise, and told her she must follow him to his closet; and asking her whether she knew the hand of the letter he pulled out of his pocket? went from her, leaving this admonition aloud: "If you would save your husband, you must give me an account of all you know, without prevarication; for every body is satisfied that he is too fond of you to be able to hide from you the names of the rest of the conspirators, or any other particulars whatsoever." He went to his closet, and soon after the lady was sent for to an audience. The servant knew his distance when matters of state were to be debated; and the governor, laying aside the air with which he had appeared in public, began to be the supplicant, and to rally an affliction which it was in her power easily to remove. She easily perceived his intention; and, bathed in tears, began to deprecate so wicked a design. Lust, like ambition, takes all the faculties of the mind and body into its service and subjection. Her becoming tears her honest anguish, the wringing of her hands, and the many changes of her posture and figure in the vehemence of speaking, were but so many attitudes in which he beheld her beauty, and farther incentives of his desire. All humanity was lost in that one appetite; and he signified to her in so many plain terms, that he was unhappy till he possessed her, and nothing less should be the price of her husband's life; and she must, before the following noon, pronounce the death or enlargement of Danvelt. After this notification, when he saw Sapphira enough distracted to make the subject of their discourse to common eyes appear different from what it was, he called his servants to conduct her to the gate. Loaded with insupportable affliction, she immediately repairs to her husband, and having signified to the gaolers that she had a proposal to make to her husband from the governor, she was left alone with him, revealed to him all that had passed, and represented the endless conflict she was in between love to his person and fidelity to his bed. It is easy to imagine the sharp affliction this honest pair was in upon such an incident, in lives not used to any but ordinary occurrences. The man was bridled by shame from speaking what his fear prompted upon so near an approach of death; but let

fall

fall words that signified to her, he should not think her polluted, though she had not confessed to him that the governor had violated her person, since he knew her will had no part in the action. She parted from him with this oblique permission, to save a life he had not resolution enough to resign for the safety of his honour.

The next morning the unhappy Sapphira attended the governor, and being led into a remote apartment, submitted to his desires. Rynfault commended her charms; claimed a familiarity after what had passed between them; and with an air of gaiety, in the language of a gallant, bid her return and take her husband out of prison: but, continued he, my fair one must not be offended that I have taken care he should not be an interruption to our future assignations. These last words foreboded what she found when she came to the gaol, her husband executed by the order of Rynfault.

It was remarkable, that the woman, who was full of tears and lamentations during the whole course of her affliction, uttered neither sigh nor complaint, but stood fixed with grief at this consummation of her misfortunes. She betook herself to her abode; and, after having in solitude paid her devotions to Him who is the avenger of innocence, the repaired privately to court. Her person, and a certain grandeur of sorrow negligent of forms, gained her passage into the presence of the duke her sovereign. As soon as she came into the presence, she broke forth into the following words: "Behold, O mighty Charles, a wretch weary of life, though it has always been spent with innocence and virtue. It is not in your power to redress my injuries, but it is to avenge them; and if the protection of the distressed, and the punishment of oppressors, is a task worthy of a prince, I bring the duke of Burgundy ample matter for doing honour to his own great name, and of wiping infamy off mine." When she had spoken this, she delivered to the duke a paper reciting her story. He read it with all the emotion that indignation and pity could raise in a prince jealous of his honour in the behaviour of his officers and the prosperity of his subjects.

Upon an appointed day Rynfault was sent for to court, and in the presence of a few of the council confronted by Sapphira. The prince asking, "Do you know that lady?" Rynfault, as soon as he could recover his surprise, told the duke he would marry her, if his highness would please to think that a reparation. The duke seemed contented with this answer, and stood by during the immediate solemnization of the ceremony. At the conclusion of it he told Rynfault, "Thus far you have done as constrained by my authority: I shall not be satisfied of your kind usage of her, without you sign a gift of your whole estate to her after your decease." To the performance of this also the duke was a witness. When these two acts were executed, the duke turning to the lady, told her, "It now remains for me to put you in quiet possession of what your husband has so bountifully bestowed on you;" and ordered the immediate execution of Rynfault.

8. One of the greatest of the Turkish princes was Mamood, or Mahmud, the Gaznevide. His name is still venerable in the east; and of the noble parts of his

character, a regard to justice was not the least. Of this the following example is related by Mr Gibbon in his *Decline and Fall of the Roman Empire*.—As he sat in the divan, an unhappy subject bowed before the throne to accuse the insolence of a Turkish soldier who had driven him from his house and bed. "Suspend your clamours (said Mahmud); inform me of his next visit, and ourself in person will judge and punish the offender." The sultan followed his guide; invested the house with his guards; and extinguishing the torches, pronounced the death of the criminal, who had been seized in the act of rapine and adultery. After the execution of his sentence, the lights were rekindled, and Mahmud fell prostrate in prayer; then rising from the ground, he demanded some homely fare, which he devoured with the voraciousness of hunger. The poor man, whose injury he had avenged, was unable to suppress his astonishment and curiosity; and the courteous monarch condescended to explain the motives of this singular behaviour. "I had reason to suspect that none except one of my sons could dare to perpetrate such an outrage; and I extinguished the lights, that my justice might be blind and inexorable. My prayer was a thanksgiving on the discovery of the offender; and so painful was my anxiety, that I had passed three days without food since the first moment of your complaint."

9. In Bourgoane's *Travels in Spain*, vol. iii. the following anecdote is given of Peter III. of Castile. A canon of the cathedral of Seville, affected in his dress, and particularly in his shoes, could not find a workman to his liking. An unfortunate shoemaker, to whom he applied after quitting many others, having brought him a pair of shoes not made to please his taste, the canon became furious, and seizing one of the tools of the shoemaker, gave him with it so many blows upon the head as laid him dead upon the floor. The unhappy man left a widow, four daughters, and a son 14 years of age, the eldest of the indigent family. They made their complaints to the chapter: the canon was profecuted and condemned not to appear in the choir for a year. The young shoemaker having attained to man's estate, was scarcely able to get a livelihood; and overwhelmed with wretchedness, sat down on the day of a procession at the door of the cathedral of Seville in the moment the procession passed by. Amongst the other canons he perceived the murderer of his father. At the sight of this man, filial affection, rage, and despair, got so far the better of his reason, that he fell furiously upon the priest, and stabbed him to the heart. The young man was seized, convicted of the crime, and immediately condemned to be quartered alive. Peter, whom we call the *Cruel*, and whom the Spaniards, with more reason, call the *lover of justice*, was then at Seville. The affair came to his knowledge; and after learning the particulars, he determined to be himself the judge of the young shoemaker. When he proceeded to give judgment, he first annulled the sentence just pronounced by the clergy; and after asking the young man what profession he was, "I forbid you (said he) to make shoes for a year to come."

10. In Gladwin's *History of Indostan*, a singular fact is related of the emperor Jehangir, under whose father Akber the Mogul empire in Hindostan first obtained

Justice.

tained any regular form. Jehangir succeeded him at Agra on the 22d of October 1605; and the first order which he issued on his accession to the throne was for the construction of the golden chain of *justice*. It was made of pure gold, and measured 30 yards, consisting of 60 links, weighing four mounds of Hindostan (about 400 pounds avoirdupois). One end of the chain was suspended from the royal bastion of the fortrefs of Agra, and the other fastened in the ground near the side of the river. The intention of this extraordinary invention was, that if the officers of the courts of law were partial in their decisions, or dilatory in the administration of justice, the injured parties might come themselves to this chain; and making a noise by shaking the links of it, give notice that they were waiting to represent their grievances to his majesty."

Justice is also an appellation given to a person deputed by the king to administer justice to his subjects, whose authority arises from his deputation, and not by right of magistracy.

Of these justices there are various kinds in England; viz.

*Chief Justice of the King's Bench*, is the capital justice of Great Britain, and is a lord by his office. His business is chiefly to hear and determine all pleas of the crown; that is, such as concern offences against the crown, dignity, and peace of the king; as treasons, felonies, &c. This officer was formerly not only chief justice, but also chief baron for the exchequer, and master of the court of wards. He usually sat in the king's palace, and there executed that office, formerly performed *per comitem palatii*; he determined in that place all the differences happening between the barons and other great men. He had the prerogative of being viceregent of the kingdom whenever the king went beyond sea, and was usually chosen to that office out of the prime nobility; but his power was reduced by king Richard I. and king Edward I. His office is now divided, and his title changed from *capitalis Angliæ justitarius*, to *capitalis justitarius ad placita, coram rege tenenda*, or *capitalis justitarius banci regii*.

*Chief Justice of the Common Pleas*, he who with his assistants hears and determines all causes at the common law; that is to say, all civil causes between common persons, as well personal as real; and he is also a lord by his office.

*Justice of the Forest*, is a lord by his office, who has power and authority to determine offences committed in the king's forests, &c. which are not to be determined by any other court of justice. Of these there are two; whereof one has jurisdiction over all the forests on this side Trent, and the other beyond it.

By many ancient records, it appears to be a place of great honour and authority, and is never bestowed but on some person of great distinction. The court where this justice sits is called the *justice seat of the forest*, held once every three years, for hearing and determining all trespasses within the forest, and all claims of franchises, liberties, and privileges, and all pleas and causes whatsoever therein arising. This court may fine and imprison for offences within the forest, it being a court of record; and therefore a writ of error lies from hence to the court of king's bench. The last court of justice seat of any note was that held in the reign

of Charles I. before the earl of Holland. After the restoration another was held for form sake before the earl of Oxford; but since the revolution in 1688, the forest laws have fallen into total disuse, to the great advantage of the subject.

This is the only justice who may appoint a deputy: he is also called *justice in eyre of the forest*.

*Justices of Assize*, were such as were wont by special commission to be sent into this or that county to take assizes, for the ease of the subjects. For, whereas these actions pass always by jury, so many men might not without great damage and charge be brought up to London; and therefore justices, for this purpose, by commissions particularly authorized, were sent down to them. These continue to pass the circuit by two and two twice every year through all England, except the four northern counties, where they go only once, dispatching their several businesses by several commissions; for they have one commission to take assizes, another to deliver gaols, and another of oyer and terminer. In London and Middlesex a court of general gaol-delivery is held eight times in the year.

All the justices of peace of any county wherein the assizes are held, are bound by law to attend them, or else are liable to a fine; in order to return recognizances, &c. and to assist the judges in such matters as lie within their knowledge and jurisdiction, and in which some of them have been probably concerned, by way of previous examination. See *ASSIZES* and *JURY*.

*Justices in Eyre* (*justitiarum itinerantes, or errantes*), were those who were anciently sent with commission into divers counties to hear such causes especially as were termed *pleas of the crown*; and that for the ease of the subject, who must else have been hurried to the courts of Westminster, if the cause were too high for the county-courts.

According to some, these justices were sent once in seven years; but others will have them to have been sent oftener. Camden says, they were instituted in the reign of king Henry II. A. D. 1184; but they appear to be of an older date.

They were somewhat like our justices of assize at this day; though for authority and manner of proceeding very different.

*Justices of Gaol-Delivery*, those commissioned to hear and determine causes appertaining to such as for any offence are cast into prison. Justices of gaol-delivery are empowered by the common law to proceed upon indictments of felony, trespass, &c. and to order execution or reprieve; and they have power to discharge such prisoners as upon their trials shall be acquitted; also all such against whom, on proclamation made, no evidence appears to indict; which justices of oyer and terminer, &c. may not do. 2. Hawk. 24, 25. But these justices have nothing to do with any person not in the custody of the prison except in some special cases; as if some of the accomplices to a felony may be in such prison and some of them out of it, the justices may receive an appeal against those who are out of the prison as well as those who are in it; which appeal, after the trial of such prisoners, shall be removed into B. R. and process issue from them against the rest. But if those out of prison be omitted in the appeal, they can never be put into any other; because, there.

Justice

there can be but one appeal for one felony. In this way the gaols are cleared, and all offenders tried, punished, or delivered, in every year.—Their commission is now turned over to the justices of assize.

*Justices of Nisi Prius* are now the same with *justices of assize*. It is a common adjournment of a cause in the common pleas to put it on to such a day. *Nisi prius justitiarum venerint ad eas partes ad capiendas assisas*: from which clause of adjournment they are called *justices of nisi prius*, as well as *justices of assize*, on account of the writ and actions they have to deal in.

*Justices of Oyer and Terminer*, were justices deputed on some special occasions to hear and determine particular causes.—The commission of oyer and terminer is directed to certain persons upon any insurrection, heinous demeanour, or trespass committed, who must first enquire, by means of the grand jury or inquest, before they are empowered to hear and determine by the help of the petit jury. It was formerly held, that no judge or other lawyer could act in the commission of oyer and terminer, or in that of gaol-delivery, within the county where he was born or inhabited; but it was thought proper by 12 Geo. II. cap. 27. to allow any man to be a justice of oyer and terminer and general gaol-delivery within any county of England.

*Justices of the Peace* are persons of interest and credit, appointed by the king's commission to keep the peace of the county where they live.

Of these some for special respect are made of the quorum, so as no business of importance may be dispatched without the presence or assent of them or one of them. However, every justice of peace hath a separate power, and his office is to call before him, examine, issue warrants for apprehending, and commit to prison, all thieves, murderers, wandering rogues; those that hold conspiracies, riots, and almost all delinquents which may occasion the breach of the peace and quiet of the subject; to commit to prison such as cannot find bail, and to see them brought forth in due time to trial; and bind over the prosecutors to the assizes. And if they neglect to certify examinations and informations to the next gaol-delivery, or do not bind over prosecutors, they shall be fined. A justice may commit a person that doth a felony in his own view, without warrant; but if on the information of another, he must make a warrant under hand and seal for that purpose. If complaint and oath be made before a justice of goods stolen, and the informer, suspecting that they are in a particular house, shows the cause of his suspicion, the justice may grant a warrant to the constable, &c. to search in the place suspected, to seize the goods and person in whose custody they are found, and bring them before him or some other justice. The search on these warrants ought to be in the day-time, and doors may be broke open by constables to take the goods. Justices of peace may make and persuade an agreement in petty quarrels and breaches of the peace, where the king is not intitled to a fine, though they may not compound offences or take money for making agreements. A justice hath a discretionary power of binding to the good behaviour; and may require a recognizance, with a great penalty of one, for his keeping of the peace, where the party bound is a dangerous person, and likely to break the peace, and do much mischief; and for default of sureties he may be committed to gaol. But a man giving secu-

rity for keeping the peace in the king's bench or chancery, may have a *superseas* to the justices in the county not to take security; and also by giving surety of the peace to any other justice. If one make an assault upon a justice of peace, he may apprehend the offender, and commit him to gaol till he finds sureties for the peace; and a justice may record a forcible entry on his own possession: in other cases he cannot judge in his own cause. Contempts against justices are punishable by indictment and fine at the king's suit. Justices shall not be regularly punished for any thing done by them in sessions as judges; and if a justice be tried for any thing done in his office, he may plead the general issue, and give the special matter in evidence; and if a verdict is given for him, or the plaintiff be nonsuit, he shall have double costs; and such action shall only be laid in the county where the offence was committed. 7 Jac. cap. 5. 21 Jac. cap. 12. But if they are guilty of any misdemeanour in office, information lies against them in the king's bench, where they shall be punished by fine and imprisonment; and all persons who recover a verdict against a justice for any wilful or malicious injury, are intitled to double costs. By 24 Geo. II. cap. 44. no writ shall be sued out against any justice of peace, for any thing done by him in the execution of his office, until notice in writing shall be delivered to him one month before the suing out of the same, containing the cause of action, &c. within which month he may tender amends; and if the tender be found sufficient, he shall have a verdict, &c. Nor shall any action be brought against a justice for any thing done in the execution of his office, unless commenced within six months after the act committed.

A justice is to exercise his authority only within the county where he is appointed by his commission, not in any city which is a county of itself or town corporate, having their proper justices, &c. but in other towns and liberties he may. The power and office of justices terminate in six months after the demise of the crown, by an express writ of discharge under the great seal, by writ of *superseas*, by a new commission, and by accession of the office of sheriff or coroner.

The original of justices of the peace is referred to the fourth year of Edward III. They were first called *conservators*, or *wardens of the peace*, elected by the county, upon a writ directed to the sheriff; but the power of appointing them was transferred by statutes from the people to the king; and under this appellation appointed by 1 Edw. III. cap. 16. Afterwards the statute 34 Edw. III. cap. 1. gave them the power of trying felonies, and then they acquired the appellation of *justices*. They are appointed by the king's special commission under the great seal, the form of which was settled by all the judges, A. D. 1500; and the king may appoint as many as he shall think fit in every county in England and Wales, though they are generally made at the discretion of the lord chancellor, by the king's leave. At first the number of justices was not above two or three in a county. 18 Edw. III. cap. 2. Then it was provided by 34 Edw. III. cap. 1. that one lord, and three or four of the most worthy men in the county, with some learned in the law, should be made justices in every county. The number was afterwards restrained first to six, and then to eight, in every county, by 12 Ric. II. cap. 10. and 14 Ric. II.

Justice.

cap. 11. But their number has greatly increased since their first institution. As to their qualifications, the statutes just cited direct them to be of the best reputation and most worthy men in the county; and the statute 13 Ric. II. cap. 7. orders them to be of the most sufficient knights, esquires, and gentlemen of the law; and by 2 Hen. V. stat. 1. cap. 4. and stat. 2. cap. 1. they must be resident in their several counties. And by 18 Hen. VI. cap. 11. no justice was to be put in commission, if he had not lands to the value of 20*l.* *per annum*. It is now enacted by 5 Geo. II. cap. 11. that every justice shall have 100*l.* *per annum*, clear of all deductions; of which he must make oath by 18 Geo. II. cap. 20. And if he acts without such qualification, he shall forfeit 100*l.* It is also provided by 5 Geo. II. that no practising attorney, solicitor, or proctor, shall be capable of acting as a justice of the peace.

*Justices of Peace within Liberties*, are justices of the peace who have the same authority in cities or other corporate towns as the others have in counties; and their power is the same; only that these have the assize of ale and beer, wood and victuals, &c. Justices of cities and corporations are not within the qualification act, 5 Geo. II. cap. 18.

*Fountain of Justice*, one of the characters or attributes of the king. See PREROGATIVE.

By the fountain of justice the law does not mean the author or original, but only the distributor. Justice is not derived from the king, as from his *free gift*; but he is the steward of the public, to dispense it to whom it is *due*. He is not the spring, but the reservoir; from whence right and equity are conducted, by a thousand channels, to every individual. The original power of judicature, by the fundamental principles of society, is lodged in the society at large: but as it would be impracticable to render complete justice to every individual, by the people in their collective capacity, therefore every nation has committed that power to certain select magistrates, who with more ease and expedition can hear and determine complaints; and in England this authority has immemorially been exercised by the king or his substitutes. He therefore has alone the right of erecting courts of judicature: for though the constitution of the kingdom hath entrusted him with the whole executive power of the laws, it is impossible, as well as improper, that he should personally carry into execution this great and extensive trust: it is consequently necessary that courts should be erected, to assist him in executing this power; and equally necessary, that, if erected, they should be erected by his authority. And hence it is, that all jurisdictions of courts are either mediately or immediately derived from the crown, their proceedings run generally in the king's name, they pass under his seal, and are executed by his officers.

It is probable, and almost certain, that in very early times, before our constitution arrived at its full perfection, our kings in person often heard and determined causes between party and party. But at present, by the long and uniform usage of many ages, our kings have delegated their whole judicial power to the judges of their several courts; which are the grand depository of the fundamental laws of the kingdom, and have gained a known and stated jurisdiction, regulated by certain and established rules, which the

Justice.

crown itself cannot now alter but by act of parliament. And in order to maintain both the dignity and independence of the judges in the superior courts it is enacted by the statute 13 W. III. c. 2. that their commissions shall be made (not, as formerly, *durante beneplacito*, but) *quamdiu bene se gesserint*, and their salaries ascertained and established; but that it may be lawful to remove them on the address of both houses of parliament. And now, by the noble improvements of that law in the statute of 1 Geo. III. c. 23. enacted at the earnest recommendation of the king himself from the throne, the judges are continued in their offices during their good behaviour, notwithstanding any demise of the crown (which was formerly held immediately to vacate their seats), and their full salaries are absolutely secured to them during the continuance of their commissions; his majesty having been pleased to declare, that "he looked upon the independence and uprightness of the judges, as essential to the impartial administration of justice; as one of the best securities of the rights and liberties of his subjects; and as most conducive to the honour of the crown."

In criminal proceedings or prosecutions for offences, it would still be a higher absurdity, if the king personally sat in judgment; because in regard to these he appears in another capacity, that of *prosecutor*. All offences are either against the king's peace or his crown and dignity; and are so laid in every indictment. For though in their consequences they generally seem (except in the case of treason and a very few others) to be rather offences against the kingdom than the king; yet, as the public, which is an invisible body, has delegated all its power and rights, with regard to the execution of the laws, to one visible magistrate, all affronts to that power, and breaches of those rights, are immediately offences against him, to whom they are so delegated by the public. He is therefore the proper person to prosecute for all public offences and breaches of the peace, being the person injured in the eye of the law. And this notion was carried so far in the old Gothic constitution (wherein the king was bound by his coronation oath to conserve the peace), that in case of any forcible injury offered to the person of a fellow-subject, the offender was accused of a kind of perjury, in having violated the king's coronation oath; *dicebatur fregisse juramentum regis juratum*. And hence also arises another branch of the prerogative, that of *pardonning* offences; for it is reasonable, that he only who is injured should have the power of forgiving. See PARDON.

In this distinct and separate existence of the judicial power, in a peculiar body of men, nominated indeed, but not removeable at pleasure, by the crown, consists one main preservative of the public liberty; which cannot subsist long in any state, unless the administration of common justice be in some degree separated both from the legislative and also from the executive power. Were it joined with the legislative, the life, liberty, and property, of the subject would be in the hands of arbitrary judges, whose decisions would be then regulated only by their own opinions, and not by any fundamental principles of law; which, though legislators may depart from, yet judges are bound to observe. Were it joined with the executive, this union might soon be an over-balance for the legislative. For which reason, by the statute of 16 Car. I. c. 10. which

abolished the court of star-chamber, effectual care is taken to remove all judicial power out of the hands of the king's privy-council; who, as then was evident from recent instances, might soon be inclined to pronounce that for law which was most agreeable to the prince or his officers. Nothing therefore is more to be avoided in a free constitution, than uniting the provinces of a judge and a minister of state. And indeed, that the absolute power, claimed and exercised in a neighbouring nation, is more tolerable than that of the eastern empires, is in a great measure owing to their having vested the judicial power in their parliaments; a body separate and distinct from both the legislative and executive: and if ever that nation recovers its former liberty, it will owe it to the efforts of those assemblies. In Turkey, where every thing is centered in the sultan or his ministers, despotic power is in its meridian, and wears a more dreadful aspect.

A consequence of this prerogative is the legal ubiquity of the king. His majesty, in the eye of the law, is always present in all his courts, though he cannot personally distribute justice. His judges are the mirror by which the king's image is reflected. It is the regal office, and not the royal person, that is always present in court, always ready to undertake prosecutions or pronounce judgment, for the benefit and protection of the subject. And from this ubiquity it follows, that the king can never be nonsuit; for a nonsuit is the desertion of the suit or action by the non-appearance of the plaintive in court. For the same reason also, in the forms of legal proceedings, the king is not said to appear by his attorney, as other men do; for he always appears, in contemplation of law, in his own proper person.

From the same original, of the king's being the fountain of justice, we may also deduce the prerogative of issuing proclamations, which is vested in the king alone. See PROCLAMATION.

*Justice-Seat.* See FOREST COURTS.

**JUSTICIA, MALABAR-NUT:** A genus of the monogynia order, belonging to the diandria class of plants; and in the natural method ranking under the 40th order, *Personata*. The corolla is ringent; the capsule bilocular, paring with an elastic spring at the beel; the stamina have only one anthera. There are 19 species, all of them natives of the East Indies, growing many feet high; some adorned with fine large leaves, others with small narrow ones, and all of them with monopetalous ringent flowers. Only two species are cultivated in our gardens, viz. the *adhatoda* or common Malabar-nut, and the *hyssopifolia* or snap-tree. The first grows ten or twelve feet high, with a strong woody stem, branching out widely all around; having large, lanceolate, oval leaves, placed opposite; and from the ends of the branches short spikes of white flowers, with dark spots, having the helmet of the corolla concave. The second hath a shrubby stem branching from the bottom pyramidally three or four feet high; spear-shaped, narrow, entire leaves, growing opposite; and white flowers, commonly by threes, from the sides of the branches; succeeded by capsules, which burst open with elastic force for the discharge of the seeds; whence the name of *snap-tree*. Both species flower here in summer, but never produce any fruit. They are propagated by

layers and cuttings, and require the same treatment with other tender exotics.

**JUSTICIAR**, in the old English laws, an officer instituted by William the Conqueror, as the chief officer of state, who principally determined in all cases civil and criminal. He was called in Latin *Capitulis* *Justiciarus totius Angliæ*. For JUSTICIAR in Scotland, See LAW, n<sup>o</sup> clvi. 10—12.

**JUSTICIARY, or Court of JUSTICIARY**, in Scotland. See LAW, n<sup>o</sup> clvi. 10—12.

**JUSTIFICATION**, in law, signifies a maintaining or showing a sufficient reason in court why the defendant did what he is called to answer. Pleas in justification must set forth some special matter: thus, on being sued for a trespass, a person may justify it by proving, that the land is his own freehold; that he entered a house in order to apprehend a felon; or by virtue of a warrant, to levy a forfeiture, or in order to take a distress; and in an assault, that he did it out of necessity.

**JUSTIFICATION**, in theology, that act of grace which renders a man just in the sight of God, and worthy of eternal happiness. See THEOLOGY.

The Romanists and Reformed are extremely divided about the doctrine of justification; the latter contending for justification by faith alone, and the former by good works.

**JUSTIN**, a celebrated historian, lived, according to the most probable opinion, in the second century, under the reign of Antoninus Pius. He wrote, in elegant Latin, an abridgment of the history of Trogus Pompeius; comprehending the actions of almost all nations, from Ninus the founder of the Assyrian empire to the emperor Augustus. The original work, to the regret of the learned, is lost: this abridgment, being written in a polite and elegant style, was probably the reason why that age neglected the original. The best editions of Justin are, *ad usum Delphini*, in 4to; and *cum notis variorum et Gronovii* in 8vo.

**JUSTIN (St)**, commonly called *Justin Martyr*, one of the earliest and most learned writers of the eastern church, was born at Neapolis, the ancient Sechem of Palestine. His father Priscus, a Gentile Greek, brought him up in his own religion, and had him educated in all the Grecian learning. To complete his studies he travelled to Egypt; and followed the sect of Plato, with whose intellectual notions he was much pleased. But one day walking by the sea-side, wrapt in contemplation, he was met by a grave ancient person of a venerable aspect; who, falling into discourse with him, turned the conversation by degrees from the excellence of Platonism to the superior perfection of Christianity; and reasoned so well, as to raise in him an ardent curiosity to inquire into the merits of that religion; in consequence of which inquiry, he was converted about the year 132. On his embracing that religion, he quitted neither the profession nor the habit of a philosopher: but a persecution breaking out under Antoninus, he composed *An Apology for the Christians*; and afterwards presented another to the emperor Marcus Aurelius, in which he vindicated the innocence and holiness of the Christian religion against Creteas a Cynic philosopher, and other calumniators. He did honour to Christianity by his learning and

Justinian,  
Justiniani.

and the purity of his manners; and suffered martyrdom in 167. Besides his two Apologies, there are still extant his *Dialogue with Trypho*, a Jew; two treatises addressed to the Gentiles, and another on the unity of God. Other works are also ascribed to him. The best editions of St Justin are those of Robert Stephens, in 1551 and 1571, in Greek and Latin: that of Morel, in Greek and Latin, in 1656; and that of Don Prudentius Marandus, a learned Benedictine, in 1742 in folio. His style is plain, and void of all ornament.

JUSTINIAN I. son of Justin the elder, was made Cæsar and Augustus in 527, and soon after emperor. He conquered the Persians by Belisarius his general, and exterminated the Vandals; regained Africa; subdued the Goths in Italy; defeated the Moors; and restored the Roman empire to its primitive glory. See (History of) CONSTANTINOPLE, n<sup>o</sup> 93—97. and ITALY, n<sup>o</sup> 17, &c.

The empire being now in the full enjoyment of a profound peace and tranquillity, Justinian made the best use of it, by collecting the immense variety and number of the Roman laws into one body. To this end, he selected ten of the most able lawyers in the empire; who, revising the Gregorian, Theodosian, and Hermogenian codes, compiled one body, called *Codex Justinianus*. This may be called the *statute law*, as consisting of the rescripts of the emperors. But the reduction of the other part was a much more difficult task: it was made up of the decisions of the judges and other magistrates, together with the authoritative opinions of the most eminent lawyers; all which lay scattered, without any order, in no less than 2000 volumes and upwards. These were reduced to the number of 50; but ten years were spent in the reduction. However, the design was completed in the year 529, and the name of *Digests* or *Pandects* given to it. Besides these, for the use chiefly of young students in the law to facilitate that study, Justinian ordered four books of institutes to be drawn up, containing an abstract or abridgement of the text of all the laws: and, lastly, the laws of modern date, posterior to that of the former, were thrown into one volume in the year 529, called the *Novella*, or New Code.

This emperor died in the year 565, aged 83, in the 39th of his reign, after having built a great number of churches; particularly the famous Sancta Sophia at Constantinople, which is esteemed a masterpiece of architecture.

JUSTINIANI (St Laurence), the first patriarch of Venice, was born there of a noble family in 1381. He was a very pious prelate, and died in 1485; he left several pieces of piety, which were printed together at Lyons in 1568, in one volume folio, with his life prefixed by his nephew. Clement VII. beatified him in 1574, and he was canonized by Alexander VIII. in 1690.

JUSTINIANI (Bernard), was born at Venice in 1408. He obtained the senator's robe at the age of 19, served the republic in several embassies, and was elected procurator of St Mark in 1474. He was a learned man, and wrote the *History of Venice*, with some other works of considerable merit; and died in 1498.

N<sup>o</sup> 171.

JUSTINIANI (Augustin), bishop of Nebo, one of the most learned men of his time, was descended from a branch of the same noble family with the two foregoing; and was born at Genoa in 1480. He assisted at the fifth council of Lateran, where he opposed some articles of the concordat between France and the court of Rome. Francis I. of France made him his almoner; and he was for five years regius professor of Hebrew at Paris. He returned to Genoa in 1522, where he discharged all the duties of a good prelate; and learning and piety flourished in his diocese. He perished at sea in his passage from Genoa to Nebbio, in 1536. He composed several pieces; the most considerable of which is, *Psalterium Hebræum, Græcum, Arabicum, et Chaldeum, cum tribus Latinis interpretationibus et glossis*. This was the first psalter of the kind printed; and there is also ascribed to the same prelate a translation of Maimonides's *Moore Nevochim*.

JUSTNESS, the exactness or regularity of any thing.

Justness is chiefly used in speaking of thought, language, and sentiments. The justness of a thought consists in a certain precision or accuracy, by which every part of it is perfectly true, and pertinent to the subject. Justness of language consists in using proper and well chosen terms; in not saying either too much or too little. M. de Mere, who has written on justness of mind, distinguishes two kinds of justness; the one arising from taste and genius, the other from good sense or right reason. There are no certain rules to be laid down for the former, viz. to show the beauty and exactness in the turn or choice of a thought; the latter consists in the just relation which things have to one another.

JUTES, the ancient inhabitants of Jutland in Denmark.

JUTLAND, a large peninsula, which makes the principal part of the kingdom of Denmark. It is bounded on the south-east by the duchy of Holstein, and is surrounded on the other sides by the German ocean and the Baltic sea. It is about 180 miles in length from north to south, and 50 in breadth from east to west. The air is very cold but wholesome; and the soil is fertile in corn and pastures, which feed a great number of bees, that are sent to Germany, Holland, and elsewhere. This was anciently called the *Cimbrian Chersonesus*, and is supposed to be the country from whence the Saxons came into England. It is divided into two parts, called *North* and *South Jutland*: the latter is the duchy of Sleswick, and lies between North Jutland and the duchy of Holstein; and the duke of that name is in possession of part of it, whose capital town is Gottorp, for which reason the sovereign is called the *duke of Holstein Gottorp*.

JUVENAL (Decius Junius), the celebrated Roman satyrist, was born about the beginning of the emperor Claudian's reign, at Aquinum in Campania. His father was probably a freed-man, who, being rich, gave him a liberal education, and, agreeably to the taste of the times, bred him up to eloquence; in which he made a great progress, first under Fronto the grammarian, and afterwards, as is generally conjectured, under Quintilian; after which he attended the bar, and made a distinguished figure there for many years by his eloquence. In the practice of this profession he

Justin  
Juven

he

he had improved his fortune and interest at Rome before he turned his thoughts to poetry, the very style of which, in his satires, speaks a long habit of declamation: *subactum redolent declamatorem*, say the critics. It is said he was above 40 years of age when he recited his first essay to a small audience of his friends; but being encouraged by their applause, he ventured a greater publication: which reaching the ears of Paris, Domitian's favourite at that time, though but a pantomime player, whom our satyrist had severely insulted, that minion made his complaint to the emperor; who sent him thereupon into banishment, under pretence of giving him the command of a cohort in the army, which was quartered at Pentapolis, a city upon the frontiers of Egypt and Libya.

After Domitian's death, our satyrist returned to Rome, sufficiently cautioned not only against attacking the characters of those in power, under arbitrary princes, but against all personal reflections upon the great men then living; and therefore he thus wisely concludes the debate he is supposed to have maintained for a while with a friend on this head, in the first satire, which seems to be the first that he wrote after his banishment:

*Experiar quid concedatur in illos  
Quorum Flaminia tegitur cinis atque Latina.*

"I will try what liberties I may be allowed with those whose ashes lie under the Flaminian and Latin ways," along each side of which the Romans of the first quality used to be buried.—It is believed that he lived till the reign of Adrian in 128. There are still extant 16 of his satires, in which he discovers great wit, strength, and keenness, in his language: but his style is not perfectly natural; and the obscenities with which these satires were filled render the reading of them dangerous to youth.

JUVENCUS (Caius Vecticus Aquilinus), one of the first of the Christian poets, was born of an illustrious family in Spain. About the year 320 he put the life of Jesus Christ into Latin verse, of which he composed four books. In this work he followed almost word for word the text of the four evangelists: but his verses are written in a bad taste, and his Latin is not pure.

JUVENTAS, in mythology, the goddess who presided over youth among the Romans. This goddess was long honoured in the Capitol, where Servius Tullius erected her statue. Near the chapel of Minerva there was the altar of Juventas, and upon this altar a picture of Proserpine. The Greeks called the goddess of youth *Hebe*; but it has been generally supposed that this was not the same with the Roman *Juventas*.

JUXON (Dr William), born at Chichester in 1682, was bred at Merchant-Taylor's school, and from thence elected into St John's college Oxford, of which he became president. King Charles I. made him bishop of London; and in 1635 promoted him to the post of lord high treasurer of England. The whole nation, and especially the nobility, were greatly offended at this high office being given to a clergyman; but he behaved so well in the administration, as soon put a stop to all the clamour raised against him. This place he held no longer than the 17th of May 1641, when

he prudently resigned the staff, to avoid the storm which then threatened the court and the clergy. In the following February, an act passed depriving the bishops of their votes in parliament, and incapacitating them from any temporal jurisdiction. In these leading steps, as well as the total abolition of the episcopal order which followed, he was involved with his brethren; but neither as bishop nor as treasurer was a single accusation brought against him in the long parliament. During the civil wars, he resided at his palace at Fulham, where his meek, inoffensive, and genteel behaviour, notwithstanding his remaining steady in his loyalty to the king, procured him the visits of the principal persons of the opposite party, and respect from all. In 1648, he attended on his majesty at the treaty in the isle of Wight; and by his particular desire, waited upon him at Cotton-house, Westminster, the day after the commencement of his trial; during which he frequently visited him in the office of a spiritual father; and his majesty declared he was the greatest comfort to him in that afflictive situation. He likewise attended his majesty on the scaffold, where the king taking off his cloak and George, gave him the latter: after the execution, our pious bishop took care of the body, which he accompanied to the royal chapel at Windsor, and stood ready with the common-prayer book in his hands to perform the last ceremony for the king; but was prevented by Colonel Whichcot, governor of the castle.—He continued in the quiet possession of Fulham-palace till the ensuing year 1649, when he was deprived, having been spared longer than any of his brethren. He then retired to his own estate in Gloucestershire, where he lived in privacy till the restoration, when he was presented to the see of Canterbury; and in the little time he enjoyed it, expended in buildings and reparations at Lambeth-palace and Croyden-house near 15,000l. He died in 1663; having bequeathed 7000l. to St John's college, and to other charitable uses near 5000l. He published a Sermon on Luke xviii. 31. and Some Considerations upon the Act of Uniformity.

JUXTAPOSITION, is used by philosophers to denote that species of growth which is performed by the apposition of new matter to the surface or outside of old. In which sense it stands opposed to *intus-fusception*; where the growth of a body is performed by the reception of a juice within it diffused through its canals.

IVY, in botany. See *HEDERA*.

IXIA, in botany: A genus of the monogynia order, belonging to the triandria class of plants; and in the natural method ranking under the 6th order, *Enzifera*. The corolla is hexapetalous, patent, and equal; there are three stigmata a little upright and petalous. There are several species, consisting of herbaceous, tuberous, and bulbous-rooted flowery perennials, from one to two feet high, terminated by hexapetalous flowers of different colours. They are propagated by offsets, which should be taken off in summer at the decay of the leaves: but as all the plants of this genus are natives of warm climates, few of them can bear the open air of this country in winter.

IXION, in fabulous history, king of the Lapithæ, married Dia the daughter of Deionius, to whom he

Ixora,  
Jynx.

refused to give the customary nuptial presents. Deionius in revenge took from him his horses: when Ixion, dissembling his repentment, invited his father-in-law to a feast, and made him fall through a trap-door into a burning furnace, in which he was immediately consumed. Ixion being afterwards stung with remorse for his cruelty, ran mad; on which Jupiter, in compassion, not only forgave him, but took him up into heaven, where he had the impiety to endeavour to corrupt Juno. Jupiter, to be the better assured of his guilt, formed a cloud in the resemblance of the goddess, upon which Ixion begat the centaurs: but boasting of his happiness, Jove hurled him down to Tartarus, where he lies fixed on a wheel encompassed with serpents, which turns without ceasing.

IXORA, in botany: A genus of the monogynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 47th order, *Stellate*. The corolla is monopetalous, funnel-shaped, and long, superior; the stamina above the throat; the berry tetraspermous.

Plate.  
CCLIX.

JYNX, in ornithology, a genus of birds belonging to the order of picæ; the characters of which are, that the bill is slender, round, and pointed; the nostrils are concave and naked; the tongue is very long, very slender, cylindric, and terminated by a hard point; and the feet are formed for climbing. There is only one species, *viz.* the *torquilla*. The colours of this bird are elegantly pencilled, though its plumage is marked with the plainest kinds: a list of black and ferruginous strokes divides the top of the head and back; the sides of the head and neck are ash coloured, beautifully traversed with fine lines of black and reddish-brown; the quill-feathers are dusky, but each web

is marked with rust-coloured spots; the chin and breast are of a light yellowish-brown, adorned with sharp-pointed bars of black; the tail consists of ten feathers, broad at their ends and weak, of a pale ash-colour, powdered with black and red, and marked with four equidistant bars of black: the irides are of a yellowish colour.—The wry-neck, Mr Pennant apprehends, is a bird of passage, appearing with us in the spring before the cuckoo. Its note is like that of the kestrel, a quick-repeated squeak; its eggs are white, with a very thin shell; it builds in the hollows of trees, making its nest of dry grass. It has a very whimsical way of turning and twirling its neck about, and bringing its head over its shoulders, whence it had its Latin name *torquilla*, and its English one of *wry neck*: it has also the faculty of erecting the feathers of the head like those of the jay. It feeds on ants, which it very dexterously transfixes with the bony and sharp end of its tongue, and then draws them into its mouth; and while the female is sitting, the male has been observed to carry these insects to her.—We find this bird mentioned as an inhabitant throughout Europe, and of many parts of the old Continent. It is in Russia, Sweden, Lapland, Greece, Italy, Babylon, and Bengal; authorities for which Buffon mentions, and says, that at the end of summer this bird grows very fat, when it becomes excellent eating; for which reason some have named it the *Ortolan*. The young ones, while in the nest, will hiss like to many snakes; inso-much that many have been prevented plundering the old ones of their offspring, on supposition that they were advancing their hands on the brood of this loathsome reptile.

## K.

**K** the tenth letter, and seventh consonant, of our alphabet; being formed by the voice, by a guttural expression of the breath through the mouth, together with a depression of the lower jaw and opening of the teeth.

Its sound is much the same with that of the hard *c*, or *qu*: and it is used, for the most part, only before *e*, *i*, and *n*, in the beginning of words; as *ken*, *kill*, *know*, &c. It used formerly to be always joined with *c* at the end of words, but is at present very properly omitted, at least in words derived from the Latin: thus, for *publick*, *musick*, &c. we say, *public*, *music*, &c. However, in monosyllables, it is still retained, as *jack*, *black*, *mack*, &c.

*K* is borrowed from the Greek *kappa*; and was but little used among the Latins: Priscian looked on it as a superfluous letter; and says, it was never to be used except in words borrowed from the Greek. Daufiquius, after Sallust, observes, that it was unknown to the ancient Romans.—Indeed we seldom find it in any Latin authors, excepting in the word *kalendar*, where it sometimes stands in lieu of a *c*.—Carthage, however, is frequently spelt on medals with a *K*: SALVIS AUG. ET CAES FEL. KART. and sometimes the letter *K* alone stood for *Caribage*.—M. Berger has observed, that a capital *K*, on the reverse of the medals of the

emperors of Constantinople, signified *Konstantinus*; and on the Greek medals he will have it to signify ΚΟΙΛΗ ΣΤΡΙΑ, “Coelesyria.”

Quintilian tells us, that in his time some people had a mistaken notion, that wherever the letter *c* and *a* occurred at the beginning of a word, *k* ought to be used instead of the *c*. See *C*.

Lipius observes, that *K* was a stigma anciently marked on the foreheads of criminals with a red-hot iron.

The letter *K* has various significations in old charters and diplomas; for instance, *KR*. stood for *chorus*, *KR. C.* for *cara civitas*, *KRM.* for *carmen*, *KR. AM. N. carus amicus noster*, *K S.* *chaos*, *K T.* *capite tonsus*, &c.

The French never use the letter *k* excepting in a few terms of art and proper names borrowed from other countries. Ablancourt, in his dialogue of the letters, brings in *k* complaining, that he has been often in a fair way to be banished out of the French alphabet, and confined to the countries of the north.

*K* is also a numeral letter, signifying 250, according to the verse;

*K quoque ducentos & quinquaginta tenebit.*

When it had a stroke at top, *K̄*, it stood for 250,000.

*K* on the French coinage denotes money coined at Bourdeaux.

**KABA.** See **MECCA.**

**KADESH, KADESH-BARNEA, OR EN-MISHPAT** (anc. geog.), a city celebrated for several events. At Kadesh, Miriam the sister of Moses died (Numb. xx. 1.). Here it was that Moses and Aaron, showing a distrust in God's power when they smote the rock at the waters of strife, were condemned to die, without the consolation of entering the promised land (Numb. xxvii. 14.). The king of Kadesh was one of the princes killed by Joshua (xii. 22.). This city was given to the tribe of Judah, and was situated about eight leagues from Hebron to the south.

Mr Wells is of opinion, that this Kadesh, which was situated in the wilderness of Zin, was a different place from Kadesh-barnea in the wilderness of Paran.

**KADMONÆI, OR CADMONÆI** (anc. geog.), a people of Palestine, said to dwell at the foot of mount Hermon; which lies east, and is the reason of the appellation, with respect to Libanus, Phœnicia, and the north parts of Palestine. Called also *Hevai* (Moses).

**KÆMPERIA, ZEDOARY,** in botany: A genus of the monogynia order, belonging to the monandria class of plants; and in the natural method ranking under the 8th order, *Scitamineæ*. The corolla is sexpartite, with three of the segments larger than the rest, patulous; and one only bipartite.

*Species.* 1. The galanga, common galangal, or long zedoary, has tuberos, thick, oblong, fleshy roots; crowned with oval, close-fitting leaves, by pairs, four or five inches long, without footstalks; and between them close-fitting white flowers, with purple bottoms, growing singly. 2. The rotunda, or round zedoary, has thick, fleshy, swelling, roundish, clustering roots, sending up spear-shaped leaves, six or eight inches long, near half as broad, on upright footstalks; and between them, immediately from the roots, rise whitish flowers, tinged with green, red, yellow, and purple, centres. Both these are perennial in root; but the leaves rise annually in spring, and decay in winter. They flower in summer: each flower is of one petal, tubulous below, but plain above, and divided into six parts; they continue three or four weeks in beauty, but are never succeeded by seeds in this country.

*Culture.* Both these plants must be potted in light rich mould, and always kept in the hot-house, giving in plenty of water in summer, but more sparingly in winter. They are propagated by parting the roots in the spring, just before they begin to push forth new leaves.

*Uses.* This plant is cultivated with great care by the inhabitants of Siam for the sake of its root; the use of which, says Kempfer, is to remove obstructions of the hypochondria, to warm the stomach, discuss flatulencies, and to strengthen the bowels and the whole nervous system. The root was formerly used in this country in bitter infusions; but is now laid aside, on account of its flavour being disagreeable.

**KALENDAR,** a distribution of time, accommodated to the uses of life; or a table or almanac, containing the order of days, weeks, months, seasons, &c. happening throughout the year. See **TIME, MONTH, YEAR, &c.**

It is called *kalendar*, from the word *kalendar*, anciently wrote in large characters at the head of each month. See **KALENDS.**

The days in kalendars were originally divided into *octoades*, or eights; but afterwards, in imitation of the Jews, into *hebdomades*, or sevens; which custom, Scaliger observes, was not introduced among the Romans till after the time of Theodosius.

There are divers kalendars, according to the different forms of the year and distributions of time established in different countries. Hence the Roman, the Jewish, the Persian, the Julian, the Gregorian, &c. kalendars.

The ancient Roman kalendar is given by Ricciolus, Struvius, Danet, and others; by which we see the order and number of the Roman holidays and work-days.

The three Christian kalendars are given by Wolfius in his Elements of Chronology.

The Jewish kalendar was fixed by rabbi Hillel about the year 360, from which time the days of their year may be reduced to those of the Julian kalendar.

The Roman **KALENDAR** owed its origin to Romulus; but it has undergone various reformations since his time. That legislator distributed time into several periods, for the use of the people under his command: but as he was much better versed in matters of war than of astronomy, he only divided the year into ten months, making it begin in the spring, on the first of March; imagining the sun made his course through all the seasons in 304 days.

Romulus's kalendar was reformed by Numa, who added two months more, January and February; placing them before March: so that his year consisted of 355 days, and began on the first of January. He chose, however, in imitation of the Greeks, to make an intercalation of 45 days, which he divided into two parts; intercalating a month of 22 days at the end of each two years; and at the end of each two years more another of 23 days; which month, thus interposed, he called *Marcedonius*, or the intercalary February.

But these intercalations being ill observed by the pontiffs, to whom Numa committed the care of them, occasioned great disorders in the constitution of the year; which Cæsar, as sovereign pontiff, endeavoured to remedy. To this end, he made choice of Sosigenes, a celebrated astronomer of those times; who found, that the dispensation of time in the kalendar could never be settled on any sure footing without having regard to the annual course of the sun. Accordingly, as the sun's yearly course is performed in 365 days six hours, he reduced the year to the same number of days: the year of this correction of the kalendar was a year of confusion; they being obliged, in order to swallow up the 65 days that had been imprudently added, and which occasioned the confusion, to add two months besides the Marcedonius, which chanced to fall out that year; so that this year consisted of 15 months, or 445 days. This reformation was made in the year of Rome 708, 42 or 43 years before Christ.

The Roman kalendar, called also *Julian kalendar*, from its reformer Julius, is disposed into quadriennial periods; whereof the first three years, which he called *communis*, consist of 365 days; and the fourth, *bissextile*, of 366;

**Kalendar.** by reason of the six hours, which in four years make a day or somewhat less, for in 134 years an intercalary day is to be retrenched. On this account it was, that pope Gregory XIII. with the advice of Clavius and Cicconius, appointed, that the hundredth year of each century should have no bissextile, excepting in each fourth century: that is, a subtraction is made of three bissextile days in the space of four centuries; by reason of the 11 minutes wanting in the six hours whereof the bissextile consists.

The reformation of the kalendar, or the *new style*, as we call it, commenced on the 4th of October 1582, when ten days were thrown out at once, so many having been introduced into the computation since the time of the council of Nice in 325, by the defect of 11 minutes.

*Julian Christian KALENDAR*, is that wherein the days of the week are determined by the letters A, B, C, D, E, F, G, by means of the solar cycle; and the new and full moons, especially the paschal full moon, with the feast of Easter, and the other moveable feasts depending thereon, by means of golden numbers, rightly disposed through the Julian year. See *CYCLE*, and *GOLDEN Number*.

In this kalendar, the vernal equinox is supposed to be fixed to the 21st day of March; and the cycle of 19 years, or the golden numbers, constantly to indicate the places of the new and full moons; yet both are erroneous. And hence arose a very great irregularity in the time of Easter. To show this error the more apparently, let us apply it to the year 1715. In this year, then, the vernal equinox falls on the 10th of March; and therefore comes too early by 11 days. The paschal full moon falls on the 7th of April; and therefore too late, with regard to the cycle, by three days. Easter, therefore, which should have been on the 10th of April, was that year on the 17th. The error here lies only in the metempsychosis, or postponition of the moon, through the defect of the lunar cycle. If the full moon had fallen on the 11th of March, Easter would have fallen on the 13th of March; and therefore the error arising from the anticipation of the equinox would have exceedingly augmented that arising from the postponition. These errors, in course of time, were so multiplied, that the kalendar no longer exhibited any regular Easter. Pope Gregory XIII. therefore, by the advice of Aloysius Lilius, in 1582, threw 10 days out of the month of October, to restore the equinox to its place, viz. the 21st of March; and thus introduced the form of the Gregorian year, with such a provision, as that the equinox should be constantly kept to the 21st of March. The new moons and full moons, by advice of the same Lilius, were not to be indicated by golden numbers, but by epacts. The kalendar, however, was still retained in Britain without this correction: whence there was a difference of 11 days between our time and that of our neighbours. But by 24 Geo. II. c. 23. the Gregorian computation is established here, and accordingly took place in 1752.

*Gregorian KALENDAR*, is that which, by means of epacts, rightly disposed through the several months, determines the new and full moons, and the time of Easter, with the moveable feasts depending thereon, in the Gregorian year.

The Gregorian kalendar, therefore, differs from the Julian, both in the form of the year, and in that epacts

are substituted in lieu of golden numbers: for the use and disposition whereof, see *EPACT*.

Though the Gregorian kalendar be preferable to the Julian, yet it is not without its defects (perhaps, as Tycho Brahe and Cassini imagine, it is impossible ever to bring the thing to a perfect justness). For, first, the Gregorian intercalation does not hinder, but that the equinox sometimes succeeds the 21st of March as far as the 23d; and sometimes anticipates it, falling on the 19th; and the full moon, which falls on the 20th of March, is sometimes the paschal; yet not so accounted by the Gregorians. On the other hand, the Gregorians account the full moon of the 22d of March the paschal; which yet, falling before the equinox, is not paschal. In the first case, therefore, Easter is celebrated in an irregular month; in the latter, there are two Easters in the same ecclesiastical year. In like manner, the cyclical computation being founded on mean full-moons, which yet may precede or follow the true ones by some hours, the paschal full-moon may fall on Saturday, which is yet referred by the cycle to Sunday: whence, in the first case, Easter is celebrated eight days later than it should be; in the other, it is celebrated on the very day of the full-moon, with the Jews and Quartodeciman heretics; contrary to the decree of the council of Nice. Scaliger and Calvisius show other faults in the Gregorian kalendar, arising from the negligence and inadvertency of the authors; yet is this kalendar adhered to by the Romanists throughout Europe, &c. and used wherever the Roman breviary is used.

*Reformed, or Corrected KALENDAR*, is that which, setting aside all apparatus of golden numbers, epacts, and dominical letters, determines the equinox, with the paschal full-moon, and the moveable feasts depending thereon, by astronomical computation, according to the Rudolphine Tables.

This kalendar was introduced among the Protestant states of Germany in the year 1700, when 11 days were at once thrown out of the month of February; so that in 1700 February had but 18 days: by this means, the corrected style agrees with the Gregorian. This alteration in the form of the year they admitted for a time; in expectation that, the real quantity of the tropical year being at length more accurately determined by observation, the Romanists would agree with them on some more convenient intercalation.

*Construction of a KALENDAR, or Almanac.* 1. Compute the sun's and moon's place for each day of the year; or take them from ephemerides. 2. Find the dominical letter, and by means thereof distribute the kalendar into weeks. 3. Compute the time of Easter, and thence fix the other moveable feasts. 4. Add the immovable feasts, with the names of the martyrs. 5. For every day add the sun's and moon's place, with the rising and setting of each luminary; the length of day and night; the crepuscula, and the aspects of the planets. 6. Add in the proper places the chief phases of the moon, and the sun's entrance into the cardinal-points; i. e. the solstices and equinoxes; together with the rising and the setting, especially heliacal, of the planets and chief fixed stars. See *ASTRONOMY*.

The duration of the crepuscula, or the end of the evening and beginning of the morning twilight, together with the sun's rising and setting, and the length of days, may be transferred from the kalendars of one year into those of another; the differences in the fe-

veral years being too small to be of any consideration in civil life.

Hence it appears, that the construction of a kalendar has nothing in it of myllery or difficulty, if tables of the heavenly motions be at hand.

Some divide kalendars or almanacs into public and private, perfect and imperfect; others into Heathen and Christian.

Public almanacs are those of a larger size, usually hung up for common or family use; private are those of a smaller kind, to be carried about either in the hand, inscribed on a staff, or in the pocket; perfect, those which have the dominical letters as well as primes and feasts inscribed on them; imperfect, those which have only the primes and immoveable feasts. Till about the fourth century, they all carry the marks of heathenism; from that age to the seventh, they are generally divided between heathenism and Christianity.

Almanacs are of somewhat different composition, some containing more points, others fewer. The essential part is the kalendar of months and days, with the rising and setting of the sun, age of the moon, &c. To these are added various parerga, astronomical, astrological, meteorological, chronological, and even political, rural, medical, &c. as calculations, and accounts of eclipses, solar ingresses, aspects, and configurations of the heavenly bodies, lunations, heliocentric and geocentric motions of the planets, prognostics of the weather, and predictions of other events, tables of the planetary motions, the tides, terms, interest, twilight, equation, kings, &c.

*Gelalean*, or *Jellalean* *KALENDAR*, is a correction of the Persian kalendar, made by order of sultan *Gelaleddan*, in the 467th year of the Hegira; of Christ 1089.

*KALENDAR*, is also applied to divers other compositions respecting the 12 months of the year.

In this sense, *Spencer* has given the shepherd's kalendar; *Evelyn* and *Miller* the gardener's kalendar, &c.

*KALENDAR*, is used for the catalogue or fasti anciently kept in each church of the saints both universal and those particularly honoured in each church; with their bishops, martyrs, &c. Kalendars are not to be confounded with martyrologies; for each church had its peculiar kalendar, whereas the martyrologies regarded the whole church in general, containing the martyrs and confessors of all the churches. From all the several kalendars were formed one martyrology: so that martyrologies are posterior to kalendars.

*KALENDAR*, is also extended to an orderly table or enumeration of persons or things.

*Lord Bacon* wishes for a kalendar of doubts. A late writer has given a kalendar of the persons who may inherit estates in fee-simple.

*KALENDAR*, *Kalendarium*, originally denoted, among the Romans, a book containing an account of moneys at interest, which become due on the kalends of January, the usual time when the Roman usurers let out their money.

*KALENDAR Months*, the solar months, as they stand in the kalendar, viz. January 31 days, &c.

*Astronomical KALENDAR*, an instrument engraved upon copper-plates, printed on paper, and pasted on board, with a brass slider which carries a hair, and shows by inspection the sun's meridian altitude, right ascension,

declination, rising, setting, amplitude, &c. to a greater exactness than our common globes will show.

*KALENDAR of Prisoners*. See *CALENDAR*.

*KALENDAR Brothers*, a sort of devout fraternities, composed of ecclesiastics as well as laymen; whose chief business was to procure masses to be said, and alms distributed, for the souls of such members as were deceased. They were also denominated *kalendar brothers*, because they usually met on the kalends of each month, though in some places only once a quarter.

*KALENDARIVM FESTVM*. The Christians retained much of the ceremony and wantonness of the kalends of January, which for many ages was held a feast, and celebrated by the clergy with great indecencies, under the names *festum kalendarum*, or *hypodiaconorum*, or *stultorum*, that is, "the feast of fools;" sometimes also *liberius decembricia*. The people met masked in the church; and in a ludicrous way proceeded to the election of a mock pope, or bishop, who exercised a jurisdiction over them suitable to the festivity of the occasion. Fathers, councils, and popes, long laboured to restrain this licence to little purpose. We find the feast of the kalends in use as low as the close of the 15th century.

*KALENDERS*. See *CALENDERS*.

*KALENDS*, or *CALENDS*, in the Roman chronology, the first day of every month.—The word is formed from *κάλω* *I call* or *proclaim*; because, before the publication of the Roman fasti, it was one of the offices of the pontifices to watch the appearance of the new moon, and give notice thereof to the *rex sacrificulus*; upon which a sacrifice being offered, the pontiff summoned the people together in the Capitol, and there with a loud voice proclaimed the number of kalends, or the day whereon the nones would be; which he did by repeating this formula as often as there were days of kalends, *Calo Juno Novella*. Whence the name *calende* was given thereto, from *calo*, *calare*. This is the account given by *Varro*. Others derive the appellation hence, That the people being convened on this day, the pontifex called or proclaimed the several feasts or holidays in the month; a custom which continued no longer than the year of Rome 450, when *C. Flavius*, the curule ædile, ordered the fasti or kalendar to be set up in public places, that every body might know the difference of times, and the return of the festivals.

The kalends were reckoned backwards, or in a retrograde order. Thus, v. g. the first of May being the kalends of May; the last or the 30th of April was the *pridie kalendarum*, or second of the kalends of May; the 29th of April, the third of the kalends, or before the kalends: and so back to the 13th, where the ides commence; which are likewise, numbered invertedly to the fifth, where the nones begin; which are numbered after the same manner to the first day of the month, which is the kalends of April. See *IDES*, and *NONES*.

The rules of computation by kalends are included in the following verses:

*Prima dies mensis cujusque est dicta kalendæ:*  
*Sex Maius nonas, October, Julius, & Mars;*  
*Quatuor at reliqui: habet idus quilibet octo.*  
*Inde dies reliquos omnes die esse kalendas;*  
*Quas retro numerans dices a mense sequente.*

Kalendar  
||  
K. lends.

Kalends  
Kalmia.

To find the day of the kalends answering to any day of the month we are in; see how many days there are yet remaining of the month, and to that number add two: for example, suppose it the 22d day of April; it is then the 10th of the kalends of May. For April contains 30 days: and 22 taken from 30, there remains 8; to which two being added, the sum is 10. The reason of adding two is, because the last day of the month is called *secundo kalendas*, the last but one *tertio kalendas*, &c.

The Roman writers themselves are at a loss for the reason of this absurd and whimsical manner of computing the days of the month: yet it is still kept up in the Roman chancery; and by some authors, out of a vain affectation of learning, preferred to the common, more natural, and easy manner.

KALENDS, are also used in church-history to denote conferences anciently held by the clergy of each deanery, on the first day of every month, concerning their duty and conduct, especially in what related to the imposition of penance.

KALENDS of January, in Roman antiquity, was a solemn festival consecrated to Juno and Janus; wherein the Romans offered vows and sacrifices to those deities, and exchanged presents among themselves as a token of friendship.

It was only a melancholy day to debtors, who were then obliged to pay their interests, &c. Hence Horace calls it *tristes kalendas*; Lib. i. Serm. Sat. 3.

KALI, in botany. See SALSOLA.

KALISH, a province of Lower Poland, with the title of a palatinate. It is bounded on the west by the palatinate of Bosnia, on the east by that of Syrad, on the north by Regal Prussia, and on the south by Silesia. Kalish is the capital town.

KALISH, a town of Lower Poland, and capital of a palatinate of the same name, where the Jesuits have a magnificent college. It is seated on the river Prozna, in a morass, which renders it difficult of access. E. Long. 18. 0. N. Lat. 52. 20.

KALMIA, in botany: A genus of the monogynia order, belonging to the decandria class of plants; and in the natural method ranking under the 18th order, *Bicornes*. The calyx is quinquepartite; the corolla salver-shaped, formed with five nectariferous horns on the under or outer side; the capsule quinquelocular. Of this genus there are two species, viz.

1. The *latifolia*, a most beautiful shrub, which rises usually to the height of five or six feet, and sometimes twice that height in its native places. The stems of some are as big as the small of a man's leg, though generally they are smaller, and covered with a brown rough bark. The wood is very close grained, heavy, and hard like box. The limbs in general are crooked and grow irregular; but are thick-clothed with stiff smooth leaves of a shining bright green. The flowers grow in bunches on the tops of the branches to foot-stalks of three inches long: they are white, stained with purplish red, consisting of one leaf in form of a cup divided at the verge into five sections: in the middle is a stylus and 12 stamina; which, when the flower first opens, appear lying close to the sides of the cup at equal distances, their apices being lodged in ten little hollow cells, which being prominent on the outside, appear as so many little tubercles. The flowers are succeeded by small round capsules; which when ripe open in five

parts, and discharge their small dust like seeds. This plant is a native of Carolina, Virginia, and other parts of the northern continent of America; yet are not common, but are found only in particular places: they grow on rocks hanging over rivulets and running streams, and on the sides of barren hills. They blossom in May, and continue in flower the greatest part of the summer. The noxious qualities of this elegant plant lessen that esteem which its beauty claims: for although deer feed on its green leaves with impunity, yet when cattle and sheep, by severe winters deprived of better food, feed on the leaves of these plants, a great many of them die annually.

2. The *angustifolia*, rises to the height of about 16 feet, producing ever-green leaves in shape like the lauro-cerains, but small, and of a shining dark green. The flowers grow in clusters, the buds of which appear in autumn wrapped up in a conic scaly perianthium, on which is lodged a viscous matter, which protects them from the severe cold in winter. These buds dilating in the following spring, break forth into twenty or more monopetalous flowers divided into five segments, and set singly on pedicles half an inch long. These flowers, when blown, appear white; but on a near view are of a faint bluish-colour, which as the flower decays grow paler. One of the five petals is longer and more concave than the rest, and is blended with purple, green, and yellow specks, being a viscous matter on the extremities of very fine hairs. The convex side of the same petal is also speckled with yellowish green. The point rises from the centre of the flower, and has its head adorned with scarlet, and surrounded by 10 stamina, whereof three are long and seven short, whose farina issues out at a small round hole at its top. This elegant tree adorns the western and remote parts of Pennsylvania, always growing in the moist sterile soil, or on the rocky declivities of hills and river banks, in shady moist places.

KALMUCS, a tribe of Tartars, called also *Eluths*, inhabiting the larger half of what the Europeans call *Western Tartary*. Their territory extends from the Caspian sea, and the river *Yaik* or *Ural*, in 72 degrees of longitude from Ferro, to mount Altay, in 110 degrees, and from the 40th to the 52d degree of north latitude; whence it may be computed about 1930 miles in length from west to east, and in breadth from north to south about 650 miles where broadest. It is bounded on the north by Russia and Siberia, from which it is separated by a chain of mountains; on the east by mount Altay; on the south by the countries of Karazm and the two Bukharias, from which it is also separated partly by a chain of mountains and partly by some rivers. See TARTARY.

Of the Kalmuc Tartars the following curious account is given by professor Pallas. They are in general, says he, of a middle size, and it is even rare to see among them a person that is tall; the women especially are of low stature, and have very agreeable features. Their limbs are neatly turned, and very few have any defects contracted in infancy. Their education being left solely to nature, procures for them a well formed body and sound constitution. The only defect which is common among them is their having the thighs and legs somewhat bent. A fat person is hardly ever to be met with; the richest and most distinguished, though they lead a life sufficiently indolent, and enjoy abundance

dance of every thing they desire, are never excessively corpulent. Their skin is pretty fair, especially when young; but it is the custom of the lower sort to allow their male children to go quite naked both in the heat of the sun and in the smoky atmosphere of their felt huts; the men too sleep naked, covered only with their drawers; and from these circumstances they acquire that yellowish brown colour which characterises them. The women, on the contrary, have a very delicate complexion; among those of a certain rank are found some with the most beautiful faces, the whiteness of which is set off by the fine black of their hair; and in this as well as in their features they perfectly resemble the figures in Chinese paintings.

The physiognomy which distinguishes the Kalmucs is pretty generally known. Strangers are made to believe that it is frightfully deformed; and though indeed there are very ugly men to be found, yet in general their countenance has an openness in it that speaks a mild, a frank, and social disposition. In many it is of a roundish shape, and exceedingly agreeable; among the women some would be thought beauties even in those European cities where the taste is most scrupulous. The characteristic features of a Kalmuc or Mongul countenance are the following: The interior angle of the eye is placed obliquely downwards towards the nose, and is acute and fleshy; the eye-brows are black, narrow, and much arched; the nose is of a structure quite singular, being generally flat and broken towards the forehead; the cheek bone is high, the head and face very round; the eye is dark, the lips thick and fleshy, the chin short, and the teeth exceeding white, continuing so to old age; the ears are of an enormous size, standing out from the head. These characters are more or less visible in each individual; but the person that possesses them all in the highest degree is considered as the most beautifully formed.

Among all the Mongul nations, the men have much less beard than in our European countries, and among the Tartars it appears much later. The Kalmucs have most of it; and yet even with them the beard is very scanty and thin, and few have much hair on any other part of the body.

People that lead a pastoral life enjoy the bodily senses in the greatest perfection. The Kalmucs find the subtilty of their sense of smell very useful in their military expeditions, for by it they perceive at a distance the smoke of a fire or the smell of a camp. There are many of them who can tell by applying the nose to the hole of a fox or any other quadruped if the animal be within or not. They hear at a great distance the trampling of horses, the noise of an enemy, of a flock of sheep, or even of strayed cattle; they have only to stretch themselves on the ground, and to apply their ear close to the turf. But nothing is more astonishing than the acuteness of sight in most of the Kalmucs, and the extraordinary distance at which they often perceive very minute objects, such as the dust raised by cattle or horses, and this from places very little elevated; in immense level deserts, though the particular inequalities of the surface and the vapours which in fine weather are seen to undulate over the soil in great heats, considerably increase the difficulty. They are also accustomed to trace the print of a foot in these deserts by the sight alone.

These people possess many good qualities, which

give them a great superiority over the wandering Tartars. A certain natural sagacity, a social disposition, hospitality, eagerness to oblige, fidelity to their chiefs, much curiosity, and a certain vivacity accompanied with good humour, which hardly ever forsakes even the most wretched among them, form the fair side of their character. On the other hand, they are careless, superficial, and want true courage; besides, they are remarkable for credulity, distrust, and a natural inclination authorized by custom for drunkenness and debauchery, but especially for a great degree of cunning, which they too often practise. The disposition to indolence is common and natural, especially among the men, to all Asiatic nations, who lead a kind of life exempt from subjection and devoid of activity; but this is less to be perceived among the Kalmucs, on account of their natural vivacity, and does not prevent their endeavours to oblige. Those among them who exercise any little trade, or who are reduced by poverty to hire themselves to the Russians either for labour or for fishing, are very assiduous and indefatigable. They sleep but little, going to rest late and rising with the sun. To sleep through the day, unless a person is drunk, is considered by them as dishonourable. But their extreme dirtiness can neither be disguised nor justified, and proceeds much more from their education, from the slovenliness attached to the profession of a herdsman, and from levity, than from laziness; for the Kalmuc women are indefatigable in whatever concerns domestic matters: and it is for this reason, as well as on the score of sensuality, that the Kirgisians are eager to seize and carry them off whenever an opportunity presents itself.

With regard to the intellectual faculties of the Kalmucs, notwithstanding their want of instruction and information, they possess good natural parts, an excellent memory, and a strong desire to learn. They acquire the Russian language with great facility, and pronounce it well; in which last article they very much surpass the Chinese. It would be very easy to civilize them, if their petulance and manner of life did not render it impracticable.

Although the Kalmucs are generally of a sanguine and choleric temperament, they live more amicably together than one could expect in a people that lead so independent a life. They seldom come to blows even over their cups, and their quarrels are hardly ever bloody. A murder very rarely happens, though their anger has something in it exceedingly fierce. It would seem that the morality of their religion, though extremely idolatrous, has been able to moderate their natural disposition in this respect; for in consequence of their dogmas, with regard to the transmigration of souls, every wanton murder either of men or beasts is thought a deadly sin.

The Kalmucs are exceedingly affable; and of so social a disposition, that it is rare for a traveller to perceive another even at the distance of several miles without going to salute him, and to inquire into the object of his journey. When a troop of Kalmucs perceive any person at a distance, it is customary for them to detach one of their number to the next eminence, from whence he makes a signal with his cap for the person to draw near. If this signal is not obeyed, the person is considered as an enemy or a robber, and is often pursued as such. They enter willingly into friendships;

ships;

Kalmucs. ships; but these connections are not quite disinterested; for to give and to receive presents are with them essential articles. A mere trifle, however, is sufficient to induce them to do you all manner of service; and they are never ungrateful as far as they are able. Adversity cannot deprive them of courage nor alter their good humour. A Kalmuc will never beg if he were in the extremest misery, but rather endeavour to acquire a subsistence by cheating; and when no other way remains, he will hire himself to some rich individual of his nation, or to some Russian, either as a herdsman, a fisherman, or for any other sort of labour. Very few of the rich value themselves much upon their wealth: but those who do, show no contempt for the poor of their own nation; though the meaner sort pay their court very obsequiously to the rich, who are always surrounded with a swarm of idle dependants.

Nothing can be more prudent than that exercise of hospitality practised by wandering nations: it is of the greatest advantage to those among them who travel across their deserts; and each individual who practises it, may rely on reaping the benefit of it wherever he goes. A Kalmuc provided with a horse, with arms and equipage, may ramble from one place to another for three months together, without taking with him either money or provisions. Wherever he comes he finds either distant relations or friends, to whom he is attached by the ties of hospitality, from whom he meets with the kindest reception, and is entertained in the best manner their circumstances afford. Perhaps he lodges in the first unknown cottage he finds upon his road; and scarcely has he entered it, but his wants are supplied with the most affectionate cordiality. Every stranger, of whatsoever nation, never fails to be well received by a Kalmuc; and he may depend upon having his effects in the greatest security the moment he has put himself under the protection of his host: for to rob a guest is considered by the Kalmucs as the most abominable of all crimes.

When the master of the house sits down to meat in company with others of inferior rank, he begins indeed by serving himself and his family, but whatever remains is distributed among the assistants. When they smoke tobacco, the pipe circulates incessantly from one to another. When any one receives a present either of meat or drink, he divides it faithfully with his companions, even though of inferior rank. But they are much more niggardly of their other effects, and especially of their cattle, and do not willingly give these away except when they hope to receive a suitable return: or if any relation has accidentally suffered the loss of his flocks, he is sure to be most willingly assisted. Perhaps too it may be related as an article of their hospitality, that they abandon their wives to their friends with the greatest facility, and in general they are very little inclined to jealousy.

Their robberies are never committed upon their equals, and even the greater part of the rapine exercised on other tribes is founded on hatred or national quarrels; neither do they willingly attempt this by open force, but prefer the machinations of cunning, which are so natural to them. It must also be confessed, that it is only those that live with princes, and in camps where these hold their courts, or their priests,

that are most addicted to these practices; while the common people, satisfied with the pleasures of the pastoral life, spend their days in innocent simplicity, and never attack the property of another till forced by necessity, or led by their superiors who show them the example.

The Kalmucs are very faithful to their lawful prince; they endure every sort of oppression, and yet are with difficulty induced to revolt; but if they belong to a prince who has not become so by right of succession, they very easily rebel. They honour old age. When young men travel with such as are older than themselves, they take upon them the whole care of the cattle as well as of the feast. They are exceedingly prudent in matters that relate to their sovereign or their nation, or which are recommended to their direction by the priests, to whom they yield an unreserved obedience.

The moveable habitations of the Kalmucs are those felt huts with a conical roof in use among all the roaming Asiatics. The truly ingenious invention of these tents was undoubtedly conceived in the eastern parts of Asia, and most probably by the Mongul nations. As they can be entirely taken to pieces and folded in a small compass, they are very useful, and perfectly agree with the migratory life of these people, who are still ignorant of the use of carriages. The frame of these huts, and the felt they are covered with, though made as light as possible, yet are a sufficient load for a camel or two oxen. But the capacity of these huts, their warmth in winter, their strength in resisting tempests and excluding rain, abundantly compensate for this inconvenience. The wood endures many years; and though the felt begins to break into holes in the second year, the common people, who do not consider it as disgraceful to have them mended and patched, make them serve a good deal longer. The huts are in general use from the prince down to the meanest Kalmuc, differing only in size and in the embellishments within. In winter, they are warm even when heated with the dried excrements of their cattle, to which they are often obliged to have recourse for want of other combustibles in many places of the deserts which are destitute of wood. In summer they remove the felt to enjoy the fresh air.

The master of the tent has his bed placed opposite to the door behind the fire-place. The bedsteads are low and made of wood. The rich adorn their beds with curtains, and spread carpets of felt upon the ground. When a Kalmuc possesses an idol, he places it near the head of his bed, and sets before it several small consecrated cups full of water, milk, or other food. Before this sort of altar he fixes in the ground the trunk of a tree, on which he places a large iron basin destined to receive the libations of all the drink he makes use of in a day. On festivals the idol is decorated, the lamps are lighted, and perfumes burnt before it.

The riches of the Kalmucs, and their whole means of subsistence, depend on their flocks, which many of them reckon by hundreds and even by thousands. A man is thought capable of living on his possessions when he is master of ten cows with a bull, eight mares with a stallion. The animals they have in greatest abundance are horses, horned cattle, and sheep. Camels, which

require time and pains to rear, cannot multiply much with them: they are besides too delicate; and it is only the rich or the priests who possess any of them. Their horses are but small, too weak for the draught, and too wild; but they do not yield to any in swiftness, and support with ease the weight of a man. They may be made to gallop for several hours successively without injury; and when necessity requires it, they can pass twice 24 hours without drinking. They have a little hoof, but very hard; and they may be used at all times without being shod. In this country the horses live and perpetuate themselves without any assistance from man. The Kalmucs castrate the greater part of their male foals, and at the same time slit their nostrils, that they may breathe more freely when they run. The stallions are never separated from the mares, that there may always be plenty of milk. The stallions are leaders of the herd, and often wander at a distance into the deserts at the head of their females, defending them from the wolves with the greatest intrepidity. The Kalmucs have the art of breaking a young horse without using a bridle. They seize him before he is two years old by means of a noose fixed to the end of a long pole; an instrument they use in taking their riding horses which feed in the middle of the herd. They put no saddle at first on the colt they mean to break, but tie a strait girth round his body; by the help of which the horseman can keep himself firm. When he is mounted, the horse is abandoned to his fury; they allow him to run and agitate himself as much as he pleases on the open plain till he is fatigued. The horseman is solicitous only to keep himself fast; and when the horse begins to abate of his impetuosity, he urges him again with the whip till his strength is almost gone: he is then saddled and bridled, and made to go for some time at a moderate pace; after which he is entirely tamed.

The horned cattle of the Kalmucs are of a beautiful shape. They keep more bulls than are necessary for the cows, and employ a great number of them as beasts of burden for carrying their houses and their other furniture from place to place. They think a bull equal to 50 cows. These and the mares give milk only while they suckle their calves or their foals, which are accordingly kept close to the tents during the day, and only suffered to suck freely during the night; a practice which the Kalmucs pretend makes their cattle stronger and more durable. They generally milk their mares three or four times a day, and sometimes every two hours when the herbage is abundant. The cows are milked but twice a day.

The Kalmuc sheep are of the same species with those found in all Great Tartary, having large tails like a bag, exceedingly fat, and which furnish a suet as soft as butter. They have also large pendant ears, and their head is much arched. Their wool is coarse, and the ewes seldom have horns. One ram is sufficient for an hundred ewes. Little use is made of the milk. The wool is fit for nothing but to make felt for the tents. A great many sheep die during winter, and a greater number still of the early lambs; the skins of which are wrought into those fine furs so much esteemed in Russia and foreign parts.

Camels belong only to the rich; for they are very dear, multiply very slowly, and are subject to many

diseases. The deserts of the Wolga, and almost all those of the southern parts of Great Tartary, furnish excellent pasture for these animals; but they require not only much attention in winter, but they must be continually under the eye of the herdsmen; for notwithstanding the advantage of their stature, they are of all animals least able to defend themselves against the wolf. They are guarded with much care against the violence of the cold and the winds of winter; nevertheless many of them die of a consumption accompanied with a diarrhoea, occasioned most probably by the moisture of their pasture and of the season. This disease, for which no remedy has been found, makes them languish for six months or more. They are in general so delicate, that a slight wound or blow often prove fatal to them. Besides, no animal is so much tormented with insects; and they often die in summer of those they swallow in eating the leaves of the oak and of the birch. The *mela prascearabeus*, which covers all the plains in many of those places where they feed, is generally fatal to them. In spring, when they cast their hair, and which falls at once from every part of their body, they are exposed to the bite of the spider-scorpion, an animal very common in southern countries. The wound inflicted by this insect on the skin thus naked is so venomous, that the camel dies of it in less than eight days, sometimes in three. In winter, and especially after rutting time, which happens at the end of March, the camels become lean and weak; the bunch upon their back grows flabby, and hangs down upon the side, nor does it recover its plumpness till summer.

Camels milk is thick, unctuous, and of a saltish taste, especially when the animals frequent pastures abounding with saline plants; and this last property makes the Kalmucs fond of it to tea. They make use of the hair for stuffing cushions, and for making ropes, packthread, and felt. It may be wrought into the most beautiful camlets, or into the finest and softest cloths. The camels with two bunches are a very uneasy seat to the person who mounts them; their trot is so heavy, and even their walk so rude, that he receives the most violent shocks at every step.

When a Kalmuc Horde intends to remove in search of fresh pasture, which in summer necessarily happens every four, six, or eight days, people are in the first place dispatched to reconnoitre the best place for the khan or prince, for the lama, and for the huts containing the idols. These begin the march, and are followed by the whole troop, each choosing for himself the place he thinks most convenient. The camel that is loaded with the most precious furniture is decorated with little bells, the rest march in a string one behind another, and the bulls with burdens are driven on before. On these days the women and girls dress themselves in their best clothes, and lay on abundance of paint. They have the charge, together with the boys, of leading the flocks and the beasts of burden; and on the road they beguile the tediousness of the journey with their songs.

The Kalmucs are supplied by their flocks with milk, cheese, butter, and flesh, which are the principal articles of their food. With regard to the last, they are so little squeamish, that they not only eat the flesh of their own diseased cattle, but that of almost every sort

Kalmucs.

**Kalmucs.** of wild beast, and the poor will even feed upon carion. They eat, however, the roots and stalks of many plants; such as the bulbous-rooted chervil and dandelion, &c. which they use both boiled and raw.

Their ordinary drink is the milk of mares or cows; but the former is for several reasons preferred. This, when fresh, has indeed a very disagreeable taste of garlic: but besides that it is much thinner than cow-milk, it takes as it grows four a very agreeable vinous flavour; it yields neither cream nor curd, but furnishes a very wholesome refreshing beverage, which sensibly inebriates when taken to excess. They never make use of new milk, and still less of milk or of water that have not been boiled. Their milk is boiled as soon as it is taken from the animal; when it is cold it is poured into a large leathern bag, in which there remains as much of the old milk as is sufficient to turn the new quantity sour, for they never think of cleansing those bags; and as the inside is lined with a crust deposited by the caseous part of the milk and other impurities, it is easy to imagine that a nauseous smell must exhale from them. But this is precisely the circumstance in which the secret consists of communicating to the milk a vinous fermentation.

In summer, and as often as the Kalmucs procure much milk from their flocks, they never fail to intoxicate themselves continually with the spirituous liquor which they know how to distil from it. Mares milk is the most spirituous; and the quantity meant to be distilled remains twenty-four hours in summer, and three or four days in winter, in those corrupted bags we mentioned, to prepare it for the operation. The cream is left, but the butter which forms at top is taken off and reserved for other purposes. Cows milk yields one-thirtieth part, and mares milk one-fifteenth part, of spirit. This liquor is limpid and very watery, and consequently does not take fire, but is capable of being long kept in glass-bottles. The rich Kalmucs increase its strength by a second distillation.

These people are exceedingly fond of tea and tobacco. The former is so dear, as it comes to them from China by the way of Russia, that the poor people supply its place with various wild plants; such as a species of liquorice, the seed of the sharp-leaved dock, the roots of wild angelica, and the seed of the Tartarian maple.

The Kalmucs are excellent horsemen. Their arms are lances, bows, and arrows, poignards, and crooked sabres, though the rich have fire-arms. They wear, when at war, coats of mail, which cost 50 horses, and their helmets are gilded at top. They are fond of falconry, and hunting of all sorts is their principal amusement. Their passion for play, especially with those who play cards, is carried to as great excess among them as in any other nation.

The greater part of their time is spent in diversions; and however miserable their manner of life may seem to us, they are perfectly happy with it. They cannot endure for any time the air of a close room; and think our custom of living in houses insupportable. The greatest part of them, notwithstanding of the apparent unhealthiness of their way of life, arrive at a vigorous old age; their diseases are neither frequent nor dangerous. Men of 80 or 100 years old are not uncommon; and at that age they can still very well endure the exer-

cise of riding. Simple food, the free air which they constantly breathe, a hardy vigorous constitution, continual exercise without severe labour, and a mind free from care, are the natural causes of their health and longevity.

It is very remarkable, that a migratory people, whose manner of life seems so congruous to the natural liberty of mankind, should have been subjected from time immemorial to the unlimited authority of an absolute sovereign. The Monguls of Asia afford the only instance of it; for neither written records nor ancient tradition have preserved the smallest trace of their ever having enjoyed a state of independence. On the contrary, they acknowledge that they have at all times been subject to khans and princes, whose authority has been transmitted to them by succession, and is considered as a right perfectly established, sacred, and divine.

**KAMAKURA**, a famous island of Japan, about three miles in circumference, lying on the south coast of Nippon. It is here they confine their great men when they have committed any fault. The coast of this island is so steep, that they are forced to be lifted up by cranes.

**KAMEEL**, **KAMEL**, or *Camel*, a machine for lifting ships. See **CAMEL**.

**KAMINIECK**, a very strong town of Poland, and capital of Podolia, with two castles and a bishop's see. It was taken by the Turks in 1672, who gave it back in 1690, after the treaty of Carlowitz. It is seated on a craggy rock, in E. Long. 27. 30. N. Lat. 48. 58.

**KAMSIN**, the name of a hot southerly wind common in Egypt, of which we find the following description in Mr Volney's Travels.—These winds, says he, are known in Egypt by the general name of *winds of 50 days*; not that they last 50 days without intermission, but because they prevail more frequently in the 50 days preceding and following the equinox. Travellers have mentioned them under the denomination of *poisonous winds*, or, more correctly, *hot winds of the desert*. Such in fact is their quality; and their heat is sometimes so excessive, that it is difficult to form any idea of its violence without having experienced it; but it may be compared to the heat of a large oven at the moment of drawing out the bread. When these winds begin to blow, the atmosphere assumes an alarming aspect. The sky, at other times so clear in this climate, becomes dark and heavy; the sun loses his splendor, and appears of a violet colour; the air is not cloudy, but grey and thick, and is in fact filled with an extremely subtle dust, which penetrates every where. This wind, always light and rapid, is not at first remarkably hot, but it increases in heat in proportion as it continues. All animated bodies soon discover it by the change it produces in them. The lungs, which a too rarefied air no longer expands, are contracted, and become painful. Respiration is short and difficult; the skin parched and dry, and the body consumed by an internal heat. In vain is recourse had to large draughts of water; nothing can restore perspiration. In vain is coolness sought for; all bodies in which it is usual to find it deceive the hand that touches them. Marble, iron, water, notwithstanding the sun no longer appears, are hot. The streets are deserted, and the dead silence of night reigns every where.

The inhabitants of towns and villages shut themselves up in their houses, and those of the desert in their tents or in wells dug in the earth, where they wait the termination of this destructive heat. It usually lasts three days, but if it exceeds that time it becomes insupportable. Wo to the traveller whom this wind surprises remote from shelter; he must suffer all its horrible effects, which sometimes are mortal. The danger is most imminent when it blows in squalls; for then the rapidity of the wind increases the heat to such a degree as to cause sudden death. This death is a real suffocation; the lungs being empty are convulsed, the circulation is disordered, and the whole mass of blood driven by the heart towards the head and breast; whence the hæmorrhage at the nose and mouth which happens after death. This wind is especially destructive to persons of a plethoric habit, and those in whom fatigue has destroyed the tone of the muscles and the vessels. The corpse remains a long time warm, swells, turns blue, and soon becomes putrid. These accidents are to be avoided by stopping the nose and mouth with handkerchiefs; an efficacious method likewise is that practised by the camels. On this occasion these animals bury their noses in the sand, and keep them there till the squall is over. Another quality of this wind is its extreme aridity; which is such, that water sprinkled on the floor evaporates in a few minutes. By this extreme dryness it withers and strips all the plants; and by exhaling too suddenly the emanations from animal bodies, crisps the skin, closes the pores, and causes that feverish heat which is the constant effect of suppressed perspiration.

KAMTCHATKA, KAMSCHATKA, or *Kamchatka*; a large peninsula on the north-eastern part of Asia, lying between 51° and 62° of north latitude, and between 173° and 182° of east longitude from the isle of Ferro. It is bounded on the east and south by the sea of Kamtchatka, on the west by the seas of Ochotik and Penhinsk, and on the north by the country of the Koriace.

This peninsula was not discovered by the Russians before the end of the last century. It is probable, however, that some of that nation had visited Kamtchatka before the time above mentioned. For when Volodimir Atlassoff entered upon the conquest of this peninsula in 1697, he found that the inhabitants had already some knowledge of the Russians. A common tradition as yet prevails among them, that, long before the expedition of Atlassoff, one Feodotoff and his companions had resided among them, and had intermarried with the natives; and they still show the place where the Russian habitations stood. None of the Russians remained when Atlassoff first visited Kamtchatka. They are said to have been held in great veneration, and almost deified by the natives; who at first imagined that no human power could hurt them, until they quarrelled among themselves, and the blood was seen to flow from the wounds which they gave each other; and soon after, upon a separation taking place, they were all killed by the natives. These Russians were thought to be the remains of a ship's crew who had sailed quite round the north-eastern promontory of Asia called *Tschukuskoï-Nofs*. The account we have of this voyage is as follows.—In 1648, seven ketches or vessels sailed from the mouth

of the river Koyyma or Kolyma, lying in the frozen ocean in about 72° north latitude, and 173° or 174° east longitude from Ferro, in order to penetrate into the eastern ocean. Four of these were never more heard of; the remaining three were commanded by Simon Deshneff, Gerasim Ankudinoff, two chiefs of the Cossacs, and Feodotoff Alexeeff, head of the Promyshlennics or wandering Russians, who occasionally visited Siberia. Each vessel was probably manned with about 30 persons. They met with no obstructions from the ice; but Ankudinoff's vessel was wrecked on the promontory above mentioned, and the crew were distributed on board the two remaining vessels. These two soon after lost sight of each other, and never afterwards rejoined. Deshneff was driven about by tempestuous winds till October, when he was shipwrecked on the northern part of Kamtchatka. Here he was informed by a woman of Yakutsk, that Feodotoff and Gerasim had died of the scurvy; that part of the crew had been slain; and that a few had escaped in small vessels, who had never afterwards been heard of; and these were probably the people who, as we have already mentioned, settled among the Kamtchatkans.

As the inhabitants of this country were neither numerous nor warlike, it required no great force to subdue them; and in 1711 the whole peninsula was finally reduced under the dominion of the Russians.—

For some years this acquisition was of very little consequence to the crown, excepting the small tribute of furs exacted from the inhabitants. The Russians indeed occasionally hunted, in this peninsula, foxes, wolves, ermines, sables, and other animals, whose skins form an extensive article of commerce among the eastern nations. But the fur-trade carried on from thence was very inconsiderable, until the series of islands mentioned in the next article were discovered; since which time the quantities of furs brought from these islands have greatly increased the trade of Kamtchatka, and rendered it an important part of the Russian commerce.

The face of the country throughout the peninsula is chiefly mountainous. It produces in some parts birch, poplars, elders, willows, underwood, and berries of different sorts. Greens and other vegetables are raised with great facility; such as white cabbage, turnips, radishes, beet-root, carrots, and some cucumbers. Agriculture is in a very low state, owing chiefly to the nature of the soil and the severe hoar-frosts; for though some trials have been made with respect to the cultivation of grain, and oats, barley, and rye, have been sown, yet no crop has ever been procured sufficient in quantity or quality to answer the trouble of raising it. Hemp, however, has of late years been cultivated with great success.—Every year a vessel belonging to the crown sails from Ochotik to Kamtchatka laden with salt, provisions, corn, and Russian manufactures; and returns in June or July of the following year with skins and furs.

Many traces of volcanoes have been observed in this peninsula; and there are some mountains which are in a burning state at present. The most considerable of these is situated near the middle of the peninsula. In 1762, a great noise was heard issuing from the inside of that mountain, and flames of fire were seen to

Kamtschatka.

burst from different parts. These flames were immediately succeeded by a large stream of melted snow-water, which flowed into the neighbouring valley, and drowned two natives who were there on a hunting party. The ashes and burning matters thrown from the mountain were spread over a surface of 300 verds. In 1767 was another discharge, but less considerable. Every night flames of fire were observed streaming from the mountain; and considerable damage was done by the eruption which attended them. Since that year no flames have been seen; but the mountain emits a constant smoke.

5  
Population,  
&c.

Kamtschatka is divided by the Russians into four districts; and the government of the whole is dependent upon, and subject to, the inspection of the chancery of Ochotsk. The whole Russian force stationed in this peninsula amounts to no more than 300 men. The present population of Kamtschatka is very small, amounting to scarce 4000 souls. Formerly the inhabitants were more numerous; but in 1768, the small-pox carried off 5368 persons. There are now only about 700 males in the whole peninsula who are tributary, and few more than 100 in the neighbouring islands, called the *Kuril Isles*, who are subject to Russia. The fixed annual tribute consists in 279 sables, 454 red foxes, 50 sea-otters with a dam, and 38 cub-otters. All furs exported from Kamtschatka pay a duty of 10 per cent. to the crown; the tenth part of the cargoes bought from the neighbouring islands is also delivered into the customs.

6  
Manners,  
&c. of the  
natives.

The natives of Kamtschatka are as wild as the country itself. Some of them have no fixed habitations, but wander from place to place with their herds of rein-deer; others have settled habitations, and reside upon the banks of the rivers and the shore of the Penschinska sea, living upon fish and sea-animals, and such herbs as grow upon the shore: the former dwell in huts covered with deer-skins; the latter in places dug out of the earth; both in a very barbarous manner. Their dispositions and tempers are rough; and they are entirely ignorant of letters or religion. The natives are divided into three different people, namely, the Kamtschatkans, Koreki, and Kuriles. The Kamtschatkans live upon the south side of the promontory of Kamtschatka: the Koreki inhabit the northern parts on the coast of the Penschinska sea, and round the eastern ocean almost to the river Anadir, whose mouth lies in that ocean almost in 68° N. Lat.: the Kuriles inhabit the islands in that sea, reaching as far as those of Japan. The Kamtschatkans have this particular custom, that they endeavour to give every thing a name in their language which may express the property of it; but if they do not understand the thing quite well themselves, then they take a name from some foreign language, which perhaps has no relation to the thing itself; as, for example, they call a priest *bogbog*, because probably they hear him use the word *bogbog*, "God;" bread they call *brightain augsh*, that is, Russian root; and thus of several other words to which their language is a stranger.

It appears probable, that the Kamtschatkans lived formerly in Mungalia beyond the river Amur, and made one people with the Mungals; which is farther confirmed by the following observations, such as the Kamtschatkan having several words common to the Mun-

gal Chinese language, as their terminations in ong, Kamtschatka, iug, oang, chin, cha, ching, kfi, kfung; it would be still a greater proof, if we could show several words and sentences the same in both languages. The Kamtschatkans and Mungals also are both of a middling stature, are swarthy, have black hair, a broad face, a sharp nose, with the eyes falling in, eye-brows small and thin, a hanging belly, slender legs and arms; they are both remarkable for cowardice, boasting, and slavishness, to people who use them hard, and for their obstinacy and contempt of those who treat them with gentleness.

Although in outward appearance they resemble the other inhabitants of Siberia, yet the Kamtschatkans differ in this, that their faces are not so long as the other Siberians; their cheeks stand more out, their teeth are thick, their mouth large, their stature middling, and their shoulders broad, particularly those people who inhabit the sea-coast.

Before the Russian conquest, they lived in perfect freedom, having no chief, being subject to no law, nor paying any taxes; the old men, or those who were remarkable for their bravery, bearing the principal authority in their villages, though none had any right to command or inflict punishment.

Their manner of living is slovenly to the last degree: they never wash their hands nor face, nor cut their nails; they eat out of the same dish with the dogs, which they never wash; they never comb their heads, but both men and women plait their hair in two locks, binding the ends with small ropes. When any hair starts out, they sew it with threads to make it lie close; by this means they have such a quantity of lice, that they can scrape them off by handfuls, and they are nasty enough even to eat them. Those that have not natural hair sufficient, wear false locks, sometimes as much as weigh to pounds, which makes their heads look like a haycock.

They place their chief happiness in idleness, and satisfying their natural lust and appetites; which incline them to singing, dancing, and relating of love-stories; and they think it more eligible to die than to lead a disagreeable life; which opinion often leads them to self murder. This was so common after the conquest, that the Russians had great difficulty to put a stop to it. They have no notion of riches, fame, or honour; therefore covetousness, ambition, and pride, are unknown among them. On the other hand, they are careless, lustful, and cruel: these vices occasion frequent quarrels and wars among them, sometimes with their neighbours, not from a desire of increasing their power, but from some other causes; such as the carrying off their provisions, or rather their girls, which is frequently practised as the most summary method of procuring a wife. Their trade is almost entirely confined to procuring the immediate necessaries and conveniences of life. They sell the Koreki fables, fox and white dog-skins, dried mushrooms, and the like, in exchange for cloaths made of deer-skins and other hides. Their domestic trade consists in dogs, boats, dishes, troughs, nets, hemp, yarn, and provisions: and this kind of barter is carried on under a great show of friendship; for when one wants any thing that another has, he goes freely to visit him, and without any ceremony makes known his wants, although

though perhaps he never had any acquaintance with him before: the host is obliged to behave according to the custom of the country, and give his guest what he has occasion for; but he may afterwards return the visit, and must be received in the same manner. They fill almost every place in heaven and earth with different spirits, and offer them sacrifices upon every occasion. Some carry little idols about them, or have them placed in their dwellings; but with regard to God, they not only neglect to worship him, but in case of troubles and misfortunes they curse and blaspheme him.

It is very diverting to see them attempt to reckon above ten: for having reckoned the fingers of both hands, they clasp them together, which signifies ten; then they begin with their toes, and count to twenty; after which they are quite confounded, and cry, Metcha? that is, Where shall I take more? They reckon ten months in the year, some of which are longer and some shorter; for they do not divide them by the changes of the moon, but by the order of particular occurrences that happen in those regions. They commonly divide our year into two, so that winter is one year and summer another: the summer year begins in May, and the winter in November. They do not distinguish the days by any particular appellation, nor form them into weeks or months, nor yet know how many days are in the month or year. They mark their epochs by some remarkable thing or other; such as the arrival of the Russians, or the first expedition to Kamtchatka.

If any one kills another, he is to be killed by the relations of the person slain. They burn the hands of people who have been frequently caught in theft; but for the first offence the thief must restore what he hath stolen, and live alone in solitude, without expecting the assistance of others. They never have any disputes about their land or their huts, every one having land and water more than sufficient for his wants. They think themselves the happiest people in the world, and look upon the Russians who are settled among them with contempt. However, this notion begins to change: for the old people who are confirmed in their customs drop off; and the young ones being converted to the Christian religion, adopt the customs of the Russians, and despise the barbarity and superstition of their ancestors.

In every village or large village, by order of her imperial majesty, is appointed a chief, who is sole judge in all causes except those of life and death; and not only those chiefs, but even the common people, have their chapels for worship. Schools are also erected in almost every village, to which the Kamtchatkans send their children with great pleasure: by this means it is to be hoped that barbarity will be in a short time rooted out from amongst them.

Under the name of *offrog*, is understood every habitation consisting of one or more huts, all surrounded by an earthen wall or palisado.—The huts are built in the following manner: they dig a hole in the earth about five feet deep, the breadth and length proportioned to the number of people designed to live in it. In the middle of this hole they plant four thick wooden pillars; over these they lay balks, upon which

they form the roof or ceiling, leaving in the middle a square opening which serves them for a window and chimney; this they cover with grass and earth, so that the outward appearance is like a round hillock; but within they are an oblong square, with the fire in one of the long sides of the square: between the pillars round the walls of their huts they make benches, upon which each family lies separately; but on that side opposite to the fire there are no benches, it being designed for their kitchen furniture, in which they dress their victuals for themselves and dogs. In those huts where there are no benches, there are barks laid upon the floor, and covered with mats. They adorn the walls of their huts with mats made of grass. They enter their huts by ladders, commonly placed near the fire-hearth; so that, when they are heating their huts, the steps of the ladder become so hot, and the smoke so thick, that it is almost impossible for a stranger to go up or down without being burnt, and even stifled to death; but the natives find no difficulty in it; and though they can only fix their toes on the steps of the ladder, they mount like squirrels; nor do the women hesitate to go through this smoke with their children upon their shoulders, though there is another opening through which the women are allowed to pass; but if any man pretend to do the same, he would be laughed at. The Kamtchatkans live in these huts all the winter, after which they go into others called *balagans*: these serve them not only to live in during the summer, but also for magazines. They are made in the following manner: nine pillars, about two fathoms long, or more, are fixed in the ground, and bound together with barks laid over them, which they cover with rods, and over all lay grass, fastening spars, and a round sharp roof at top, which they cover with bramble, and thatch with grass. They fasten the lower ends of the spars to the barks with ropes and thongs, and have a door on each side, one directly opposite to the other. They make use of the same kind of huts to keep their fish, &c. till winter comes on, when they can more easily remove it; and this without any guard, only taking away the ladders. If these buildings were not so high, the wild beasts would undoubtedly plunder them; for notwithstanding all their precaution, the bears sometimes climb up and force their way into their magazines, especially in the harvest, when the fish and berries begin to grow scarce.

The southern Kamtchatkans commonly build their villages in thick woods and other places which are naturally strong, not less than 20 versts from the sea; and their summer habitations are near the mouths of the rivers; but those who live upon the Penschincka sea and the eastern ocean build their villages very near the shore. They look upon that river near which their village is situated as the inheritance of their tribe.

In order to kindle fire, they use a board of dry wood with round holes in the sides of it, and a small round stick; this they rub in a hole till it takes fire; and instead of tinder they use dry grass beat soft. These instruments are held in such esteem by the Kamtchatkans, that they are never without them, and they value them more than our steel and flints; but they

are.

Kamtschatka.

are excessively fond of iron instruments, such as hatchets, knives, or needles: nay, at the first arrival of the Russians, a piece of broken iron was looked upon as a great present; and even now they receive it with thankfulness, finding use for the least fragment, either to point their arrows or make darts, which they do by hammering it out cold between two stones. As some of them delight in war, the Russian merchants are forbid to sell them any warlike instruments: but they are ingenious enough to make spears and arrows out of the iron pots and kettles which they buy; and they are so dexterous, when the eye of a needle breaks, as to make a new eye, which they will repeat until nothing remains but the point.

12  
Construction of their boats.

The Kamtschatkans make their boats of poplar-wood; but the Kuriles not having any wood of their own, make use of what is thrown on shore by the sea, and is supposed to come from the coasts of Japan, China, or America. The northern inhabitants of Kamtschatka, the settled Koreki and Tschukotkoi, for want of proper timber and plank, make their boats of the skins of sea-animals. They sew the pieces together with whales beards, and caulk them with moss or nettles beat small. These boats hold two persons; one of which sits in the prow, and the other in the stern. They push them against the stream with poles, which is attended with great trouble: when the current is strong, they can scarcely advance two feet in ten minutes; notwithstanding which, they will carry these boats, fully loaded sometimes 20 versts, and when the stream is not very strong, even 30 or 40 versts. The larger boats carry 30 or 40 pood; when the goods are not very heavy, they lay them upon a float or bridge resting upon two boats joined together. They use this method in transporting their provisions down the stream, and also to and from the islands.

13  
Of their clothes.

Their cloaths for the most part are made of the skins of deer, dogs, several sea and land animals, and even of the skins of birds, those of different animals being frequently joined in the same garment. They make the upper garment after two fashions; sometimes cutting the skirts all of an equal length, and sometimes leaving them long behind in form of a train, with wide sleeves of a length to come down below the knee, and a hood or caul behind, which in bad weather they put over their heads below their caps; the opening above is only large enough to let their heads pass: they sew the skins of dogs feet round this opening, with which they cover their faces in cold stormy weather; and round their skirts and sleeves they put a border of white dog-skin; upon their backs they sew the small shreds of skins of different colours. They commonly wear two coats; the under coat with the hair-side inwards, the other side being dyed with alder; and the upper with the hair outwards. For the upper garment they choose black, white, or speckled skins, the hair of which is most esteemed for the beauty of its colour.

Men and women without distinction use the above-mentioned garments, their dress only differing in their under-cloathing and in the covering of their feet and legs. The women have an under-garment, which they commonly wear at home in the house, consisting of a breeches and waistcoat sewed together. The breeches

are wide like those of the Dutch skippers, and tie below the knee; the waistcoat is wide above, and drawn round with a string. The summer habits are made of dressed skins without hair: their winter-garment is made of deer or stone-ram skins with the hair on. The undress or household habit of the men is a girdle of leather with a bag before, and likewise a leathern apron to cover them behind; these girdles are sewed with hair of different colours. The Kamtschatkans used formerly to go a hunting and fishing during the summer in this dress; but now this fashion is changed, and they wear linen shirts, which they buy from the Russians.

The covering of their feet and legs is made of skins of different sorts: in the summer-time, during the rains they wear the skins of seal with the hair outwards; but their most common covering is the skin of the legs of the rein-deer, and sometimes of the legs of other beasts, the shaggiest they can find, to preserve them against the cold. But the buskins which both the Cossacs and Kamtschatkans use in their finest dress, are made in the following manner: the sole is of white seal skin, the upper part of white fine leather, the hind quarters of white dog skin; what comes round the legs is of dressed leather or dyed seal-skin; the upper parts are embroidered. These buskins are so extraordinary, that if a bachelor is observed to wear them, he is immediately concluded to be upon a scheme of courtship.

They wear the same sort of caps as the people of Yakutski. In summer they have a sort of hats of birch bark tied about their head. The Kuriles use in the summer-time caps made of plaited grass. The womens head-dress is the perukes that we formerly mentioned; and these were so dear to them, that when they came to be Christians they were with difficulty prevailed upon to quit this dress for one more decent: however, at present, round the Russ settlements, all is entirely changed, the women wearing shirts, ruffles, waistcoats, caps, and ribbands; which change nobody now complains of except the very old people. The women do all their work in mittens; they formerly never washed their faces, but now they use both white and red paint: for white paint they make use of a rotten wood; and for red a sea plant, which they boil in seal's fat, and rubbing their cheeks with it, make them very red. They dress most in the winter time, especially when they either receive or pay visits.

The common cloaths for a Kamtschatkan and his family will not cost him less than 100 rubbles; for the coarsest worsted stockings, which cost in Russia 20 kopeeks, cannot be bought here for less than a ruble; and all other things are sold in the same proportion. The Kuriles are more able to buy good cloaths than the Kamtschatkans; for they can purchase for one sea-beaver as much as the Kamtschatkans can for twenty foxes; and one beaver coats the Kuriles no more trouble than five foxes do the Kamtschatkans; for he must be a good hunter who catches more than ten foxes in the winter; and a Kurile thinks himself unlucky if he doth not catch three beavers in the season; besides which, great numbers are thrown upon the shore by storms.

The Kamtschatkans divide their fish into six parts: Their sides and tail are hung up to dry; the back and thinner

thinner part of the bully are prepared apart, and generally dried over the fire; the head is laid to four in pits, and then they eat it like salt fish, and esteem it much, though the stink is such that a stranger cannot bear it; the ribs and the flesh which remain upon them they hang up and dry, and afterwards pound for use; the larger bones they likewise dry for food for their dogs: in this manner all these different people prepare the yokola, which is the principal food, or, one may say, household bread; and they eat it for the most part dry.

Their second favourite food is caviar, or the roes of fish, which they prepare three different ways. They dry the roe whole in the air; or take it out of the skin which envelops it, and spreading it upon a bed of grass, dry it before the fire; or, lastly, make rolls of it with the leaves of grass, which they also dry. They never take a journey or go to hunting without dry caviar; and if a Kamtchatkan has a pound of this, he can subsist without any other provision a great while: for every birch and alder tree furnishes him with bark, which with his dried caviar makes him an agreeable meal; but they cannot eat either separately, for the caviar sticks like glue to the teeth; and it is almost impossible to swallow the bark, chewed ever so long by itself. There is still a fourth method, which both Kamtchatkans and Koreki use in preparing their caviar: the first having covered the bottom of a pit with grass, they throw the fresh caviar into it, and leave it there to grow four: the Koreki tie theirs in bags, and leave it to four; this is esteemed their most delicate dish.

There is a third sort of diet, called by the Kamtchatkans *chuprili*, which is prepared in this manner: in their huts, over the fire-place, they make a bridge of stakes, upon which they lay a heap of fish, which remains there until the hut becomes as warm as a bagnio. If there is no great thickness of fish, one fire serves to dress it; but sometimes they are obliged to make two, three, or more fires. Fish dressed in this manner is half roasted, half smothered, but has a very agreeable taste, and may be reckoned the best of all the Kamtchatkan cookery: for the whole juice and fat is prepared with a gradual heat, and kept in by the skin, from which they may when done enough be easily separated; and as soon as it is thus dressed, they take out the guts, and spread the body upon a mat to dry: this they afterwards break small, and putting it into bags, carry it along with them for provision, eating it like the yokola.

The Kamtchatkans have a dish which they esteem very much, called *huizul*: it is fish laid to grow four in pits; and though the smell of it is intolerable, yet the Kamtchatkans esteem it a perfume. This fish sometimes rots so much in the pits, that they cannot take it out without ladders; in which case indeed they use it for feeding their dogs.

As for the flesh of land and the larger sea animals, they boil it in their troughs with several different herbs and roots; the broth they drink out of ladles and bowls, and the meat they take out upon boards, and eat in their hands. The whale and sea-horse fat they also boil with roots.

There is a principal dish at all their feasts and en-

tertainments, called *selaga*, which they make by pound. Kamtchatka. ing all sorts of different roots and berries, with the addition of caviar, and whale and seal's fat.

Before the conquest, they seldom used any thing for drink but plain water, unless when they made merry; then they drank water which had stood some time upon mushrooms. At present they drink spirits as fast as the Russians. After dinner they drink water: and when they go to bed at night, set a vessel of water by them, with the addition of snow or ice to keep it cold, and always drink it up before morning. In the winter-time, they amuse themselves frequently by throwing handfuls of snow into their mouths: and the bridegrooms, who work with the fathers of their future brides, find it their hardest task to provide snow for the family in summer-time; for they must bring it from the highest hills be the weather what it will, otherwise they would never be forgiven.

The Kamtchatkans commonly travel in sledges drawn by dogs. The animals used for this purpose differ very little from the common house-dogs; they are of a middling size, of various colours, though these seem to be more white, black, and grey, than of any other. In travelling, they make use of those that are castrated, and generally yoke four to a sledge. They drive and direct their dogs with a crooked stick about four feet long, which they sometimes adorn with different coloured thongs; this is looked upon as a great piece of finery. They drive their sledge sitting upon their right side, with their feet hanging down; for it would be looked upon as a disgrace for a man to sit down at the bottom of the sledge, or to make use of any person to drive him, nobody doing this but the women. It is very difficult to travel in these sledges; for unless a man keeps the exactest balance, he is liable every moment from the height and narrowness of them to be overturned: in a rugged road this would be very dangerous, as the dogs never stop till they come to some house, or are entangled by something upon the road; especially in going down steep hills, when they run with all their force, and are scarcely to be kept in; for which reason, in descending any great declivity, they unyoke all the dogs except one, and lead them softly down. They likewise walk up hills; for it is as much as the dogs can do to drag up the sledge empty. After a deep snow, before it has been hardened by a frost, there is no travelling with dogs till a road be made, which is effected by a man going before upon snow-shoes, whom they call *brodovshika*. The snow-shoes are made of two thin boards, separated in the middle, bound together at the ends, and with the fore part bent a little upwards. The *brodovshika*, having one of these shoes upon each foot, leaves the dogs and sledge, and going on clears the road for some way; then returning, leads forward the dogs and sledge so far as the road is made; a method which he must continue till he comes to some dwelling-house. This is very laborious; and it happens so often, that no driver ever sets out without his snow-shoes. When a storm of driven snow surprises them, they are obliged with all haste to seek the shelter of some wood, and stay there as long as the tempest lasts, which sometimes is a whole week. If they are a large company, they dig a place for themselves.

Kamchatka.

themselves under the snow, and cover the entry with wood or brambles. Sometimes they hide themselves in caves or holes of the earth, wrapping themselves up in their furs; and when thus covered, they move or turn themselves with the greatest caution lest they should throw off the snow, for under that they lie as warm as in their common huts: they only require a breathing-place; but their cloaths must not be tight or hard girt about them, for then the cold is insufferable. Another danger attending travellers is, that in the severest frost several rivers are not quite frozen over; and as the roads for the most part lie close upon the rivers, the banks being very steep, scarce a year passes without many being drowned. A disagreeable circumstance also to those who travel in these parts, is their sometimes being obliged to pass through copse, where they run the risk of having their eyes scratched out or their limbs broken; for the dogs always run most violently in the worst roads, and, to free themselves, very often overturn their driver. The best travelling is in the month of March or April, when the snow is turned hard or frozen a little at top; however, there is still this inconvenience attending it, that sometimes travellers are obliged to lodge two or three nights in desert places; and it is difficult to prevail upon the Kamchatkans to make a fire either for warming themselves or dressing victuals, as they and their dogs eat dried fish, and find themselves so warm wrapped in their furs, that they want no other heat; nay, all the people of this climate bear cold so well, that they sleep in the open air as found as others in a warm bed, and awake next morning perfectly refreshed and alert. This seems to be so natural to all here, that some of them have been seen to lie down with their backs uncovered against a fire, and notwithstanding the fire has been burnt out long before morning, they continued to sleep on very comfortably, and without any inconvenience.

*Islands in the Sea of Kamchatka.* So many of these have been discovered by the Russians, that the existence of almost a continued chain of islands between the continents of Asia and America is now rendered extremely probable. Many further discoveries of great importance to science, however, remain yet to be made. The principal islands already known are the Kuril isles, which stretch south-west towards the coasts of China or Japan, and are almost uninhabited; those called *Beer- ing's*, and *Copper islands*, the Aleutian isles, and *Fox islands*, or *Lysie Ostrova*, lie almost directly east, stretching nearly to 230° of longitude east from Ferro. The first project of making discoveries in that tempestuous sea which lies between Kamchatka and America was set on foot by Peter the Great of Russia. Captains Beering and Tchirikoff were employed in the undertaking; the former of whom was shipwrecked and died on the island which is still called by his name. As this lies at no great distance from Kamchatka, the inhabitants of the latter soon ventured over to it, as the sea-otters and other animals of that kind were accustomed to resort thither in great numbers.

Mednoi Ostroff, or Copper-island, which lies in full sight of Beering's island, was next visited. This island has its name from the great quantity of copper with which the north-east coast of it abounds, the only side

N<sup>o</sup> 171.

which is known to the Russians. It is washed up by the Kamchatka sea, and covers the shores in such abundance that many ships might be loaded with it. Perhaps an India trader might make a profitable voyage from thence to China, where this metal is in high demand. This copper is mostly in a metallic or malleable state, and many pieces seem as if they had formerly been in fusion. The island is not high; but has many hillocks, each of which has the appearance of having formerly been a volcano. With this kind of hillocks all the islands in the sea of Kamchatka abound, inasmuch that not a single island, though ever so small, was found without one; and many of them consisted of nothing else. In short, all the chain of islands above mentioned may without any stretch of imagination be considered as thrown up by some late volcanoes. The apparent novelty of every thing seems to justify this conjecture: nor can any objection be derived from the vegetable productions with which these islands abound; for the summer after the lower district of Zutphen in Holland was gained from the sea, it was covered over with wild mustard.—All these islands are subject to frequent and violent earthquakes, and abound in sulphur. We are not informed whether any lava is found upon them; but a party-coloured stone as heavy as iron, probably a lava, is mentioned as being found there. From this account it is by no means improbable that the copper above mentioned has been melted in some eruption.

Beering's island is situated due east from Kamchatka, in the 185th degree of longitude; and Copper-island about one degree more to the eastward, and in the latitude of 54° north. The former is from 70 to 80 versts long, and stretches from north-west to south-east in the same direction as Copper-island. The latter is about 50 versts in length. About 300 versts east-by-south of Copper-island lie the Aleutian isles; of which Attak is the nearest: it is rather larger than Beering's island, and stretches from west to south-east. From thence about 20 versts eastwards is situated Semitshi, extending from west to east; and near its extremity is another small island. To the south of the strait which separates the two latter islands, and at the distance of 40 versts from both of them, lies Shimiyi in a similar position, and not above 25 versts in length. All these islands lie between 54 and 55 degrees of north latitude.

The Fox islands are situated east-north-east from the Aleutians: the nearest of these, Atchak, is about 800 versts distant; it lies in 56° north latitude, and extends from west-south-west, towards east-north-east. It greatly resembles Copper-island, and is provided with a commodious harbour on the north. From thence all the other islands of this chain stretch in a direction towards north-east by east. The next to Atchak is Amlak, and about 15 versts distant: it is nearly of the same size, and has an harbour on its south side. Next follows Saugagamak, at about the same distance, but somewhat smaller; from thence is 50 versts to Amuchta, a small rocky island; and the latter to Yunakfan, another small island. About 20 versts from Yunakfan there is a cluster of five small islands, or rather mountains, Kigahist, Kagamila, Tligulac, Ulaga, and Tana Unok; and which are therefore called by the Russians

16  
Copper  
island  
described.

ians *Pat Sopki*, or the Five Mountains. Of these Tana-Unok lies most to the north-east, towards which the western point of Umnak advances within the distance of 20 versts.

Umnak stretches from south-west to north-east; it is 150 versts in length, and has a very considerable bay on the west end of the northern coast, in which there is a small island, or rock, called *Adugak*; and on the south side Shemalga, another rock. The western point of Aghunalashka, or Unalashka, is separated from the east end of Umnak by a strait near 20 versts in breadth. The position of these two islands is similar; but Aghunalashka is much the largest, and is above 200 versts long. It is divided towards the north-east into three promontories, one of which runs out in a westerly direction, forming one side of a large bay on the north coast of the island: the second stretches out north-east, ends in three points, and is connected with the island by a small neck of land. The third, or most southerly one, is separated from the last-mentioned promontory by a deep bay. Near Unalashka towards the east lies another small island called *Sibirkin*. About 20 versts from the north-east promontory of Aghunalashka lie four islands: the first, Akutan, is about half as big as Umnak; a verst further is the small island Akun; a little beyond is Akunok; and lastly, Kigalga, which is the smallest of these four; and stretches with Akun and Akunok almost from north to south. Kigalga is situated about the 61st degree of latitude. About 100 versts from thence lies an island called *Unimak*, upon which a Russian navigator (Captain Krenitzin) wintered; and beyond it the inhabitants said there was a large tract of country called *Alashka*, of which they did not know the boundaries.

The Fox islands are in general very rocky, without containing any remarkably high mountains: they are destitute of wood; but abound in rivulets and lakes, which are mostly without fish. The winter is much milder than in Siberia; the snow seldom falls before the beginning of January, and continues on the ground till the end of March. There is a volcano in Amuchta, and sulphur is produced on another island; in some others are springs hot enough to boil provisions. Sulphureous flames also are sometimes seen at night upon the mountains of Unalashka and Akutan.

The Fox islands are tolerably populous in proportion to their size. The inhabitants are entirely free, and pay tribute to no one; they are of a middle stature, and live, both in summer and winter, in holes dug in the earth. No signs of religion were found among them. Several persons indeed pass for forcerers, pretending to know things past and to come; and are accordingly held in high esteem, but without receiving any emolument. Filial duty and respect towards the aged are not held in estimation by these islanders. They are not, however, deficient in fidelity towards each other; they are of a lively and cheerful temper, though rather impetuous, and naturally prone to anger. In general, they do not observe any rules of decency; but follow all the calls of nature publicly and without the least reserve. Their principal food consists in fish, and other sea-animals, small shell-fish, and sea-plants; their greatest delicacies are wild lilies and

VOL. IX. Part II.

other roots, together with different kinds of berries. When they have laid in a store of provisions, they eat at any time of the day without distinction; but in case of necessity, they are capable of fasting several days together. They seldom heat their dwellings: but when they are desirous of warming themselves, they light a bundle of hay, and stand over it; or else they set fire to train-oil, which they pour into a hollow stone. They feed their children when very young with the coarsest flesh, and for the most part raw. If an infant cries, the mother immediately carries it to the sea-side, and, be it summer or winter, holds it naked in the water until it is quiet. This custom, it is said, is so far from doing the children any harm, that it hardens them against the cold; and accordingly they go barefooted through the winter without the least inconvenience. They are also trained to bathe frequently in the sea; and it is an opinion generally received among the islanders, that by these means they are rendered bold and fortunate in fishing.

The men wear shirts made of the skins of cormorants, sea divers, and gulls; and in order to keep out the rain, they have upper garments of the bladders and other intestines of sea lions, sea-calves, and whales, blown up and dried. They cut their hair in a circular form quite close to their ears; and shave also a round place on the top. The women, on the contrary, let the hair descend over the forehead as low as the eyebrows, and tie the remaining part in a knot upon the top of the head. They pierce the ears, and hang in them bits of coral, which they get from the Russians. Both sexes make holes in the gristles of their noses, and in the under-lips, in which they thrust pieces of bone, and are very fond of such kind of ornaments. They mark also and colour their faces with different figures. They barter among one another sea-otters, sea bears, clothes made of birds skins and of dried intestines, skins of sea-lions and sea-calves for the coverings of their canoes, wooden masks, darts, thread made of sinews and hair of reindeer.

Their household utensils are square pitchers and large troughs, which they make out of the wood driven ashore by the sea. Their weapons are bows and arrows pointed with flint, and javelins of two yards in length, which they throw from a small board. Instead of hatchets, they use crooked knives of flint or bone. Some iron knives, hatchets, and lances, were observed among them, which they had probably got by plundering the Russians.

According to the reports of the oldest inhabitants of Umnak and Unalashka, they have never been engaged in any war, either amongst themselves or with their neighbours, except with the people of Alashka, the occasion of which was as follows. The son of the toigon or chief of Umnak had a maimed hand; and some inhabitants of Alashka, who came to visit upon that island, fastened to his arm a drum, out of mockery, and invited him to dance. The parents and relations of the boy were offended at this insult: hence a quarrel ensued; and from that time the people have lived in continual enmity, attacking and plundering each other by turns. According to the reports of the islanders, there are mountains upon Alashka, and woods of great extent at some distance from the coast. The natives

Komitlat-  
ka.

*Kamchatka.* natives wear clothes made of the skins of reindeer, wolves, and foxes; and are not tributary to any of their neighbours. The inhabitants of the Fox-islands seem to have no knowledge of any country beyond Alashka, which is one of the most easterly islands yet discovered in these seas, and is probably not far distant from the continent of America.

Feasts are very common among these islanders; and more particularly when the inhabitants of one island are visited by those of the others. The men of the village meet their guests, beating drums, and preceded by the women who sing and dance. At the conclusion of the dance, the hosts invite them to partake of the feasts; after which ceremony, the former return first to their dwellings, place mats in order, and serve up their best provision. The guests next enter, take their places, and, after they are satisfied, the diversions begin. First, the children dance and caper, at the same time making a noise with their small drums, while the owners of the huts of both sexes sing. Next, the men dance almost naked, tripping after one another, and beating drums of a larger size: when these are weary, they are relieved by the women, who dance in their clothes, the men continuing in the mean time to sing and beat their drums. At last the fire is put out which had been kindled for the ceremony. The manner of obtaining fire is by rubbing two pieces of dry wood against each other, or most commonly by striking two flints together, and letting the sparks fall upon some sea-otter's hair mixed with sulphur. If any forcerer is present, it is then his turn to play his tricks in the dark; if not, the guests immediately retire to their huts, which are made, on that occasion, of their canoes and mats. The natives who have several wives do not withhold them from their guests; but where the owner of the hut has himself but one wife, he then makes the offer of a female servant.

Their hunting season is principally from the end of October to the beginning of December; during which time they kill great numbers of young sea-bears for their clothing. They pass all December in feasting and diversions similar to those above mentioned: with this difference, however, that the men dance in wooden-masks, representing various sea-animals, and painted red, green, or black, with coarse-coloured earths found upon these islands.

During these festivals, they visit each other from village to village, and from island to island. The feasts concluded, masks and drums are broken to pieces, or deposited in caverns among the rocks, and never afterwards made use of. In spring, they go out to kill old sea-bears, sea-lions, and whales. During summer, and even in winter when it is calm, they row out to sea, and catch cod and other fish. Their hooks are of bone; and for lines they make use of a string made of a long tenacious sea-weed, which is sometimes found in those seas, near 160 yards in length.

Whenever they are wounded in any encounter, or bruised by any accident, they apply a sort of yellow root to the wound, and fast for some time. When their head aches, they open a vein in that part with a stone-lancet. When they want to glue the points of their arrows to the shafts, they strike their nose till it bleeds, and use the blood as glue.

Murder is not punished among them; for they have

no judge. The following ceremonies are used in the burial of the dead. The bodies of poor people are wrapped up in their own clothes, or in mats; then laid in a grave, and covered over with earth. The bodies of the rich are put, together with their clothes and arms, in a small boat made of the wood driven ashore by the sea: this boat is hung upon poles placed crosswise; and the body is thus left to rot in the open air.

The customs and manners of the inhabitants of the Aleutian isles are nearly similar to those of the inhabitants of the Fox-islands. The former indeed are rendered tributary and entirely subject to Russia; and most of them have a slight acquaintance with the Russian language, which they have learned from the crews of the different vessels who have landed there.

KAN, or KHAN, the name of an officer in Persia, answering to that of governor in Europe.—There are kans of provinces, countries, and cities, who have different additions to distinguish them.

KANGUROO. See DIDELPHIS.

KANISCA, a very strong town of Lower Hungary, capital of the county of Selawar. It was taken by the Imperialists in 1690. It is seated on the river Drave, in E. Long. 17. 37. N. Lat. 46. 23.

KAN-TCHEOU-FOU, a flourishing town of China, in the province of Kiang-si. Its rivers, port, riches, and population, all contribute to attract strangers. A day's journey from this city is a very rapid current, almost 20 leagues in length, which flows with great impetuosity over a number of scattered rocks that are level with the water. Travellers here are in great danger of being lost, unless they take care to be conducted by one of the pilots of the country; after this passage, the river becomes twice as large as the Seine at Rouen; it is continually covered with loaded barks and other vessels under sail.—Near the walls of the city is a very long bridge, composed of 130 boats joined together by strong iron chains. The custom-house is upon this bridge, where a receiver constantly resides to visit all barks, and examine if they have paid the duties imposed on the commodities with which they are loaded. Two or three moveable boats are so placed, that by their means the bridge can be opened or shut, to give or refuse a passage; and no barks are ever permitted to pass until they have been examined. In the territory belonging to this city, a great number of those valuable trees grow, from which varnish distils. Its district is extensive, and contains 12 cities of the third class.

KAOLIN, the name of an earth which is used as one of the two ingredients in oriental porcelain. Some of this earth was brought from China, and examined by Mr Reaumur. He found that it was perfectly infusible by fire, and believed that it is a talky earth; but Mr Macquer observes, that it is more probably of an argillaceous nature, from its forming a tenacious paste with the other ingredient called *petunise*, which has no tenacity. Mr Bomare says, that by analysing some Chinese kaolin, he found it was a compound earth consisting of clay, to which it owed its tenacity; of calcareous earth, which gave it a mealy appearance; of sparkling crystals of mica; and of small gravel, or particles of quartz-crystals. He says, that he has found a similar earth upon a stratum of granite, and conjectures that it may be a decomposed granite. This conjecture

jecture is the more probable, as kaolins are frequently found in the neighbourhood of granites. See PORCELAIN.

KAOUTCHOUK. See CAOUTCHOUC.

KARAITES. See CARAITES.

KARAT. See CARACT.

KARECK, an island in the Persian Gulf, lately subject to the Dutch. It was visited by Mr Ives in 1758. He found the south part of the island well cultivated, with agreeable fields of corn, and producing plenty of esculent vegetables. In the middle are very high hills abounding with a variety of shells. Some fragments torn from their sides afforded an opportunity of observing an immense quantity of oysters, scallop, cockle, and other shells. The common tree here is the banian, but without those luxuriant shoots, which in some other places go downward and take root in the ground. The lavender-cotton is also found here; and the island abounds with fowl of various kinds. Pearl oysters are also found here, but lie at considerable depths. Mr Ives mentions one pearl of considerable size, which had upon it a natural representation of the face of a human fetus in the early months of pregnancy.

This settlement was founded by Baron Kniphaufen, brother to one of that name some time ago ambassador at the court of London. Having left the Prussian service on some disgust, he entered into that of France. He afterwards went to the East Indies, and was appointed resident to the Dutch factory at Bassora. Here he became an object to the avarice and rapacity of the Turkish governors; who having got him accused of capital crimes, he was at last glad to compound with them for 50,000 rupees, the whole sum he was worth, besides giving directions how they might squeeze other 50,000 from his successor in office (who in truth wished him turned out) and the banian who did the business of the Dutch factory, and who had likewise been concerned in underhand practices against him.

The new resident was overjoyed at his accession, but lost all patience when he found himself obliged to pay 30,000 rupees to the governor as a compliment on his entering into a post of such consequence. Nor had the banian much better reason to be satisfied, being obliged to pay down 20,000 rupees to make up the sum which was to satisfy the rapacity of the governor.

Baron Kniphaufen sailed from Bassora the very day after he was set at liberty; but having landed on this island, he, in conjunction with an Arabian sheik, formed the plan of the settlement. He then carried a letter from the sheik to the governor and council of Batavia, in which the former proposed to give up the sovereignty of the island. Before setting out for this place, however, the baron took care to dispatch a messenger across the desert to Constantinople, acquainting the Dutch ambassador with the treatment he had received, and requesting liberty of the grand vizier for the Dutch to settle at Kareck. The messenger returned with a favourable answer before the baron came back from Batavia. The governor of Bassora, then, having attempted in vain to persuade him to return to that place, wrote a letter of complaint to Batavia, accusing the baron in terms of the

utmost exaggeration, but without any mention of the 100,000 rupees. The baron, however, having got intelligence of this proceeding, used such diligence that he got back to Batavia in the very ship which carried the letter. Being thus present on the spot to answer the charges brought against him, he acquitted himself so well that his scheme was instantly approved of, and he was sent back with two ships and 50 men to take possession of Kareck, whose inhabitants at that time amounted to no more than 100 poor fishermen.

Considerable difficulties now occurred in the establishment of the new colony; for he had but very few materials with him, and the government of Batavia was very slow in sending him the succours they had promised. He was therefore obliged to send for workmen from Persia and Arabia, with whose assistance he built a small compact fort, strong enough to defend itself against any of the country powers and any ships usually sailing to India, excepting those of our East India company. Nor was he content with putting himself in a posture of defence, but even commenced hostilities against the Turks; and by detaining two vessels very richly laden, which happened to touch at the island, he at last obliged the governor of Bassora to pay back the 100,000 rupees he had extorted, 30,000 of which he restored to his successor in office at Bassora, and 20,000 to the banian. When Mr Ives visited him, he informs us, that surprising progress had been made during the little time the baron had held the sovereignty of the island, and that he intended to make it a strong and wealthy place; at the same time that he discovered his taste for literature by advancing a sum of money for books and instruments of various kinds, which were afterwards punctually sent. After that time, however, the baron quitted the service of the Dutch; and the island is again in possession of the sheik of Bundarie, to whom it formerly belonged. It is about five miles long and two in breadth; lying nearly in the middle of the Persian Gulf, about seven leagues from each side, and about 30 leagues from the mouth of Bassora river, where all ships bound to that port must call for pilots.

KARLE, a Saxon word used in our law, sometimes simply for a man; and sometimes, with an addition, for a servant or clown. Thus the Saxons call a seaman *bustard*, and a domestic servant *kufcarle*. From hence comes the modern word *churl*.

KARMATIANS, a sect of Mohammedans, who occasioned great disorders in the empire of the Arabs. See BAGDAD, n° 49.

KASTREL, or KESTRIL. See FALCO.

KATTEGATTE, a noted sea lying between part of Jutland and the coast of Sweden, and towards the latter covered with a great number of isles. It is almost closed at the extremity by the low Danish islands of Sealand and Funen, which had in old times been (with Sweden) the seat of the Sniones. Between the first and the coast of Sweden is the famous sound, the passage tributary to the Danes by thousands of ships. These islands were of old called *Cadonania*, and gave to the Kattegatte the name of *Sinus Colonus*. Its greatest depth is 35 fathoms. It decreases as it approaches the sound; which begins with 16 fathoms, and near Copenhagen shallows to even four. The Roman fleet, under the command of Germanicus, failed,

Kareck  
||  
Kattegatte.

Kauff-  
beuren  
||  
Kedron.

according to Pliny, round Germany, and even doubled the *Cimbrium Promontorium*, and arrived at the islands which fill the bottom of the Kattegatte: either by observation or information, the Romans were acquainted with 23. One they called *Glossaria*, from its amber, a fossil abundant to this day on part of the south side of the Baltic. A Roman knight was employed by Nero's master of the gladiators to collect in these parts that precious production, by which he came perfectly acquainted with this country.

KAUFFBEUREN, a free and imperial town of Germany, situated in the river Wardach, in E. Long. 10. 53. N. Lat. 47. 57.

KAY, QUAY, or *Key*. See *Key*.

KAZY, in the East Indies, a Mahometan judge or magistrate; appointed originally by the court of Delhi to administer justice according to their written law; but particularly in matters relative to marriages, the sales of houses, and transgressions of the Koran. He attests or authenticates writings, which under his seal are admitted as the originals in proof.

KEBLA, an appellation given by the Mahometans to that part of the world where the temple of Mecca is situated, towards which they are obliged to turn themselves when they pray.

KECKERMAN (Bartholomew), a native of Dantzick, and professor of philosophy there about the beginning of the 17th century. composed systems of almost all the sciences, in which he shows more method than genius. He died in 1609, fairly worn out at the age of 38 with mere scholastic drudgery.

KEDAR (anc. geog.), a district in the desert of the Saracens (so called from *Cedar*, the son of Ishmael, according to Jerome, who in another place says that Kedar was uninhabitable), on the north of Arabia Felix *Kedareni*, the people; who dwelt in tents like the other Scenites (Psalm cxx.), were rich in cattle (Isaiah lx), of a swarthy complexion (Canticles i.), and excellent at the bow (Isaiah xxi.)

KEDES (anc. geog.), a city of refuge and Levitical in the tribe of Naphthali, on the confines of Tyre and Galilee; (Josephus). Jerome calls it a sacerdotal city, situated on a mountain 20 miles from Tyre, near Paneas, and called *Cidiffus*, taken by the king of Assyria.—Another *Kedes* in the tribe of Issachar (1 Chron. vii. 72) which seems to be called *Kifion* (Joshua xix.)

KEDGE, a small anchor, used to keep a ship steady whilst she rides in a harbour or river, particularly at the turn of the tide, when she might otherwise drive over her principal anchor, and entangle the stock or flukes with her slack-cable, so as to loosen it from the ground. This is accordingly prevented by a kedge-rope that hinders her from approaching it. The Kedges are particularly useful in transporting a ship; i. e. removing her from one part of the harbour to another, by means of ropes which are fastened to these anchors. They are generally furnished with an iron stock, which is easily displaced for the convenience of moving them.

KEDRON, or CEDRON (anc. geog.), a town which, from the defeat and pursuit of the Syrians (1 Mac. xvi.), appears to have stood on the road which led from the Higher India to Azotus: in this war it was burnt by the Jews.

KEDRON, or *Cedron* (anc. geog.), St John calls it

a brook, but Josephus a deep valley between Jerusalem and mount Olivet to the east; called also *Kedron* from its blackness. A brook only in winter, or in rainy weather, according to Maundrel.

KEEL, the principal piece of timber in a ship, which is usually first laid on the blocks in building. If we compare the carcase of a ship to the skeleton of the human body, the keel may be considered as the backbone, and the timbers as the ribs. It therefore supports and unites the whole fabric, since the stem and stern-post, which are elevated on its ends, are in some measure a continuation of the keel, and serve to connect and inclose the extremities of the sides by transoms; as the keel forms and unites the bottom by timbers.

The keel is generally composed of several thick pieces placed lengthways, which, after being scarfed together, are bolted, and clenched upon the upper side. When these pieces cannot be procured large enough to afford a sufficient depth to the keel, there is a strong thick piece of timber bolted to the bottom thereof, called the *false keel*, which is also very useful in preserving the lower side of the main keel. In our largest ships of war, the false keel is generally composed of two pieces, which are called the *upper* and the *lower false keels*. See *MIDSHIP-FRAME*.

The lowest plank in a ship's bottom, called the *garboard-streak*, has its inner-edge let into a groove or channel cut longitudinally on the side of the keel: the depth of this channel is therefore regulated by the thickness of the garboard-streak.

KEEL is also a name given to a low flat-bottomed vessel, used in the river Tyne to bring the coals down from Newcastle and the adjacent parts, in order to load the colliers for transportation.

*KEEL Hauling*, a punishment inflicted for various offences in the Dutch navy. It is performed by plunging the delinquent repeatedly under the ship's bottom on one side, and hoisting him up on the other, after having passed under the keel. The blocks or pulleys by which he is suspended are fastened to the opposite extremities of the main-yard, and a weight of lead or iron is hung upon his legs, to sink him to a competent depth. By this apparatus he is drawn close up to the yard-arm, and thence let fall suddenly into the sea, where, passing under the ship's bottom, he is hoisted up on the opposite side of the vessel. As this extraordinary sentence is executed with a serenity of temper peculiar to the Dutch, the culprit is allowed sufficient intervals to recover the sense of pain, of which indeed he is frequently deprived during the operation. In truth, a temporary insensibility to his sufferings ought by no means to be construed into a disrespect of his judges, when we consider that this punishment is supposed to have peculiar propriety in the depth of winter, whilst the flakes of ice are floating on the stream; and that it is continued till the culprit is almost suffocated for want of air, benumbed with the cold of the water, or stunned with the blows his head receives by striking the ship's bottom.

KEELSON, a piece of timber which may be properly defined the interior or counter-part of the keel; as it is laid upon the middle of the floor-timbers, immediately over the keel, and like it composed of several

veral pieces scarfed together. In order to fit with more security upon the floor-timbers and crotches, it is notched about an inch and a half deep, opposite to each of those pieces, and thereby firmly scored down upon them to that depth, where it is secured by spike-nails. The pieces of which it is formed are only half the breadth and thickness of those of the keel.

The keelson serves to bind and unite the floor-timbers to the keel. It is confined to the keel by long bolts, which, being driven from without through several of the timbers, are fore-locked or clenched upon rings on the upper-side of the keelson.

KEEPER OF THE GREAT SEAL, is a lord by his office, and styled *lord keeper of the great seal of Great Britain*; he is always one of the privy-council. All grants, charters, and commissions of the king under the great seal, pass through the hands of the lord keeper; for without that seal many of those grants, &c. would be of no force; the king being, in the interpretation of the law, a corporation, and therefore passes nothing but by the great seal, which is also said to be the public faith of the kingdom, being in the highest esteem and reputation.

Whenever there is a lord-keeper, he is invested with the same place, authority, pre-eminence, jurisdiction, or execution of laws, as the lord-chancellor of Great Britain is vested with.

The lord-keeper is constituted by the delivery of the great seal, &c.

KEEPER of the *Privy-seal*, is also a lord by his office, through whose hands all grants, pardons, &c. pass before they come to the great seal; and even some things pass his hands which do not pass the great seal at all. This officer is also one of the privy council, yet was anciently called *clerk of the privy seal*. His duty is to put the seal to no grant, &c. without a proper warrant; nor with warrant where it is against law, or inconvenient, but shall first acquaint the king therewith.

KEEPING, in painting, denotes the representation of objects in the same manner that they appear to the eye at different distances from it; for which the painter should have recourse to the rules of perspective. There are two instances in which the famous Raphael Urbin has transgressed these rules: in one of his cartons, representing the miraculous draught of fishes, the men in each of the two boats appear of full size, the features of their faces being strongly marked; and the boats are represented so small, and the men so big, that any one of them appears sufficient to sink either of the boats by his own bare weight: and the fowls on the shore are also drawn so big, as to seem very near the eye of the observer, who could not possibly, in that case, distinguish the features of the men in the distant boats. Or, supposing the observer to be in either of the boats, he could not see the eyes or beaks of the fowls on the shore. The other instance occurs in his historical picture of our Saviour's transfiguration on the mount; where he is represented with those who were then with him, almost as large as the rest of his disciples at the foot of the mount, with the father and mother of the boy whom they brought to be cured; and the mother, though on her knees, is more than half as tall as the mount is high. So that the mount appears only of the size of a little hay-rick, with a few

people on its top, and a greater number at its bottom on the ground; in which case, a spectator at a little distance could as well distinguish the features of these at the top as of those on the ground. But upon any large eminence, deserving the name of a mount, that would be quite impossible.

KEIL, a very important fortress of Germany, seated on the banks of the Rhine, built by the French after a design of marshal Vauban, for the defence of Strasbourg. It was ceded to the empire in 1697, by the treaty of Ryfwick. The French retook it in 1703, and it was restored to the empire by the treaty of Rastadt. E. Long. 7. 45. N. Lat. 48. 40.

KEILL (Dr John), a celebrated astronomer and mathematician, was born at Edinburgh in 1671, and studied in the university of that city. In 1694 he went to Oxford; where, being admitted of Balliol college, he began to read lectures according to the Newtonian system in his private chamber in that college. He is said to have been the first who taught Sir Isaac Newton's principles by the experiments on which they are founded: and this, it seems, he did by an apparatus of instruments of his own providing, by which means he acquired a great reputation in the university. The first specimen he gave the public of his skill in mathematical and philosophical knowledge, was his *Examination of Dr Burnet's theory of the earth*, with *Remarks on Mr Whiston's theory*: and these theories being defended by their respective inventors, drew from Mr Keill *An examination of the reflections on the theory of the earth*, together with *A defence of the remarks on Mr Whiston's new theory*. In 1701, he published his celebrated treatise, intitled, *Introductio ad veram physiceam*, which only contains 14 lectures; but in the following editions he added two more. This work has been translated into English, under the title of *An introduction to natural philosophy*. Afterwards, being made fellow of the Royal Society, he published, in the *Philosophical Transactions*, a paper, of the laws of attraction; and being offended at a passage in the *Acta eruditorum* of Leipzig, warmly vindicated against Mr Leibnitz Sir Isaac Newton's right to the honour of the first invention of his method of fluxions. In 1709 he went to New-England as treasurer of the Palatines. About the year 1711, several objections being urged against Sir Isaac Newton's philosophy, in support of Des Cartes's notions of a plenum, Mr Keill published a paper in the *Philosophical Transactions* on the rarity of matter, and the tenuity of its composition. But while he was engaged in this dispute, queen Anne was pleased to appoint him her deceiver; and he continued in that place under king George I. till the year 1716. He had also the degree of doctor of physic conferred on him by the university of Oxford in 1713. He died in 1721. He published, besides the works already mentioned, *Introductio ad veram astronomiam*, which was translated into English by Dr Keill himself; and an edition of Commandinus's *Euclid*, with additions of his own.

KEILL (James), M. D. an eminent physician, and brother of the former, was born in Scotland about the year 1673; and having travelled abroad, read lectures of anatomy with great applause in the universities of Oxford and Cambridge, by the latter of which he had the degree of doctor of physic conferred upon him.

Keithsburg In 1700 he settled at Northampton, where he had considerable practice as a physician; and died there of a cancer in the mouth in 1719. He published, 1. An English translation of Lemery's chemistry. 2. An account of animal secretion, the quantity of blood in the human body, and muscular motion. 3. A treatise on anatomy. 4. Several pieces in the Philosophical Transactions.

KEISERSBERG, a town of Alsace in France, and in the bailiwick of Haguenau, which has belonged to the French ever since the year 1548. It is seated in a pleasant country, in E. Long. 7. 25. N. Lat. 48. 10.

KEISERSLAUERN, a town of Germany, in the Lower Palatinate, belonging to the elector Palatine; seated on the river Louter, in E. Long. 7. 51. N. Lat. 49. 22.

KEISERTOUL, a town of Switzerland, in the county of Baden, with a bridge over the Rhine, and a castle. It belongs to the bishop of Constance, and is situated in E. Long. 8. 40. N. Lat. 47. 10.

KEISERWURT, a town of Germany in the circle of Westphalia, the diocese of Cologne, and the duchy of Berg; subject to the elector Palatine. The fortifications are demolished. It is seated on the Rhine, in E. Long. 6. 49. N. Lat. 51. 16.

KEITH (James), field-marshal in the Prussian service, was the younger son of William Keith, earl-marshal of Scotland; and was born in 1696. He was designed by his friends for the law; but his inclination led to arms, and the first occasion of drawing his sword was rather an unhappy one. When he was 18 years old the rebellion broke out in Scotland; and through the indignation of his mother, he joined James's party: he was wounded at the battle of Sheriffmuir, and made his escape to France. Here he applied himself to military studies; and going to Madrid, he by the interest of the duke of Liria obtained a commission in the Irish brigades, then commanded by the duke of Ormond. He afterwards attended the duke of Liria, when he went ambassador to Muscovy; and being by him recommended to the czarina, was promoted to the rank of lieutenant-general, and invested with the order of the black eagle. He distinguished himself by his valour and conduct in the Russian service, and had no inconsiderable share in the revolution that raised Elizabeth the daughter of Peter the Great to the throne: he also served in several embassies; but finding the honours of that country but a splendid kind of slavery, he left that court and entered the Prussian service. The king of Prussia made him field-marshal of the Prussian armies, and governor of Berlin; and distinguished him so far by his confidence, as to travel in disguise with him over a great part of Germany, Poland, and Hungary. In business, he made him his chief counsellor; in his diversions, his chief companion. The king was much pleased with an amusement which the marshal invented in imitation of the game of chess. The marshal ordered several thousand small statues of men in armour to be cast by a founder; these he would set opposite to each other, and range them in battalia, in the same manner as if he had been drawing up an army; he would bring out a party from the wings or centre, and show the advantage or disadvantage resulting from the different draughts which

he made. In this manner the king and the marshal often amused themselves, and at the same time improved their military knowledge. This brave and experienced general, after many important services in the late wars of that illustrious monarch, was killed in the unfortunate affair of Hohenkerchen in the year 1758.

The family of Keith was among the most ancient in Europe. In 1010 the Scots gained a complete victory over the Danes at Camus town in Angus; King Malcolm II. as a reward for the signal bravery of a certain young nobleman who pursued and killed Camus the Danish general, bestowed on him several lands, particularly the barony of Keith in East Lothian, from which his posterity assumed their surname. The king also appointed him hereditary great marshal of Scotland, which high office continued in his family till the year 1715, when the last earl engaged in the rebellion and forfeited his estate and honours; and thus ended the family of Marschal, after serving their country in a distinguished capacity above 700 years.

KELLINGTON, or KILKHAMPTON, a town of Cornwall in England, which sends two members to parliament. W. Long. 4. 38. N. Lat. 50. 36.

KELLS, a fair and post-town of Ireland, in the county of Meath and province of Leinster, 31 miles from Dublin. It is a borough likewise, and returns two members to parliament; patron earl of Bečive. This place gives title of viscount to the family of Cholmondeley. Near it is Headfort, the magnificent seat of Lord Bečive. This town is pleasantly situated on the river Blackwater, and has four fairs. It was anciently called *Kenanus*, and afterwards *Kenlis*. In former ages it was one of the most famous cities in the kingdom; and on the arrival of the English was walled and fortified with towers. In 1178 a castle was erected where the market-place now is; and opposite to the castle was a cross of an entire stone, ornamented with bas-relief figures and many curious inscriptions in the ancient Irish character. Within a small distance was the church of St Senan; and on the south of the churchyard is a round tower which measures 99 feet from the ground, the roof ending in a point; and near the top were four windows opposite to the cardinal points. There was a celebrated monastery founded here in 550 for regular canons, and dedicated to the Virgin Mary. It owed its origin to St Columb, to whom the site of the abbey was granted by Dermod Mac Carval, or Dermod the son of Kervail king of Ireland. An episcopal see was afterwards erected here, which in the 13th century was united to that of Meath. A priory or hospital was also erected by Walter de Lacie, lord of Meath, in the reign of Richard I. for cross-bearers or crouched friars following the order of St Augustin. There was likewise a perpetual chantry of three priests or chaplains in the parish-church of St Columb in Kells to celebrate mass daily; one in the Rood chapel, another in St Mary's chapel, and a third in the chapel of St Catherine the virgin.

KELLS is also the name of a village, being a post and fair town in the county of Kilkenny, 64 miles from Dublin. It is an ancient place, situated on Kings river; and was noted for a priory of Augustines, built and richly endowed by Geoffroy Fitz-Roberts, who came

came into this kingdom with Strongbow. The prior of this place had the title of *lord spiritual*, and as such sat in the house of peers before the Reformation; the ruins only of this abbey now remain; a synod was held in it anno 1152, when John Paparo, legate from Rome, made one of the number of bishops that were convened there at that time to settle the affairs of the church. The present church is built in the Gothic manner. Fairs held 13th July.

There is a third place of the above name, situated in the county of Antrim and province of Ulster, 89 miles from Dublin, near which are the ruins of a church: this place is but a small village, seated on a river of the same name, over which it has a bridge.

KELLY (Hugh), an author of considerable repute, was born on the banks of Killarney lake in Ireland in 1739. His father, a gentleman of good family, having reduced his fortune by a series of unforeseen misfortunes, was obliged to repair to Dublin that he might endeavour to support himself by his personal industry. A tolerable school education was all he could afford to his son; who was bound an apprentice to a staymaker, and served the whole of his time with diligence and fidelity. At the expiration of his indentures, he set out for London to procure a livelihood by his business; where he encountered all the difficulties a person poor and without friends could be subject to on his first arrival in town. Happening, however, to become acquainted with an attorney, he was employed by him in copying and transcribing; an occupation which he prosecuted with so much assiduity, that he is said to have earned about three guineas a week, an income which, compared to his former gains, might be deemed affluent. Tired, however, of this drudgery, he soon after, about 1762, commenced author, and was intrusted with the management of the *Lady's Museum*, the *Court Magazine*, the *Public Ledger*, the *Royal Chronicle*, *Owen's Weekly Post*, and some other periodical publications, in which he wrote many original essays and pieces of poetry, which extended his reputation, and procured the means of subsistence for himself, his wife to whom he was then lately married, and a growing family. For several years after this period, he continued writing upon a variety of subjects, as the accidents of the times chanced to call for the assistance of his pen; and as during this period politics were the chief objects of public attention, he employed himself in composing many pamphlets on the important questions then agitated, the greater part of which are now buried in oblivion. Among these, however, was a *Vindication of Mr Pitt's Administration*, which Lord Chesterfield makes honourable mention of in the second volume of his letters. In 1767, the *Babler* appeared in two pocket volumes, which had at first been inserted in *Owen's Weekly Chronicle* in single papers; as did the *Memoirs of a Magdalene*, under the title of *Louisa Mildmay*. About 1767 he was tempted by the success of Churchill's *Rosciad* to write some strictures on the performers of either theatre, in two pamphlets, intitled *Theffis*, both which gave great offence to some of the principal persons at each house. The talents for satire, which he displayed in this work, recommended him to the notice of Mr Garrick, who in the next year caused his first play of *Falfe Delicacy* to be acted at *Drury-Lane*. It was received with great

applause; and from this time he continued to write for the stage with profit and success, until the last period of his life. As his reputation increased, he began to turn his thoughts to some mode of supporting his family less precarious than by writing, and for that purpose entered himself a member of the *Middle Temple*. After the regular steps had been taken, he was called to the bar in 1774, and his proficiency in the study of the law afforded promising hopes that he might make a distinguished figure in that profession. His sedentary course of life had, however, by this time injured his health, and subjected him to much affliction. Early in 1777 an abscess formed in his side, which after a few days illness put a period to his life. He was the author of six plays besides that above-mentioned.

KELP, in the glass-trade, a term used for a sort of potashes made use of in many of the glass-works, particularly for the green glass. It is the calcined ashes of a plant called by the same name; and in some places, of sea-thongs or laces, a sort of thick-leaved fucus or sea-wrack\*. This plant is thrown on the rocks and shores in great abundance, and in the summer months is raked together and dried as hay in the sun and wind, and afterwards burnt to the ashes called *kelp*. The process of making it is thus: The rocks, which are dry at low water, are the beds of great quantities of sea-weed; which is cut, carried to the beach, and dried: a hollow is dug in the ground three or four feet wide; round its margin are laid a row of stones, on which the sea-weed is placed, and set on fire within, and quantities of this fuel being continually heaped upon the circle, there is in the centre a perpetual flame, from which a liquid like melted metal drops into the hollow beneath: when it is full, as it commonly is ere the close of day, all heterogeneous matter being removed, the kelp is wrought with iron rakes, and brought to an uniform consistency in a state of fusion. When cool, it consolidates into a heavy dark-coloured alkaline substance, which undergoes in the glass-houses a second vitrification, and assumes a perfect transparency; the progress by which thus a parcel of sea-weed, formerly the slimy bed of seals or dreary shelter of shell-fish, is converted into a crystal lustre for an assembly-room, or a set of glasses for his majesty's table, is a metamorphosis that might be a subject for an entertaining tale.

KELSO, a town of Roxburghshire in Scotland, pleasantly situated on the river Tweed, in W. Long. 1. 20. N. Lat. 55. 38. Of this town Mr Pennant gives the following description. It is built much after the manner of a Flemish town, with a square and town-house. It contains about 2700 souls, has a very considerable market, and great quantities of corn are sold here weekly by sample. The abbey of Tyronensians was a vast pile, and, to judge by the remains, of venerable magnificence. The walls are ornamented with false round arches, intersecting each other. Such intersections form a true Gothic arch; and may as probably have given rise to that mode as the arched shades of avenues. The steeple of the church is a vast tower. This house was founded by David I. when earl of Cumberland. He first placed it at Selkirk, then removed it to Roxburgh, and finally, when he came to the crown, fixed it here in 1128. Its revenues were in money above 2000 l. Scots a-year. The abbot

Kelp,

\* See *Fucus*.

Kempis  
||  
Kempren.

abbot was allowed to wear a mitre and pontifical robes; to be exempt from episcopal jurisdiction, and permitted to be present at all general councils. The environs of Kelfo are very fine: the lands consist of gentle risings, inclosed with hedges, and extremely fertile. They have much reason to boast of their prospects. From the Chalkheugh is a fine view of the foiks of the rivers. Roxburgh-hill, Sir John Douglas's neat seat, and at a distance Fleurus; and from Pinnacle-hill is seen a vast extent of country, highly cultivated, watered with long reaches of the Tweed, well wooded on each margin. These borders ventured on cultivation much earlier than those on the west and east, and have made great progress in every species of rural economy. Turnips and cabbages for the use of cattle cover many large tracts; and potatoes appear in vast fields. Much wheat is raised in the neighbourhood, part of which is sent up the frith of Forth, and part into England. The fleeces here are very fine. The wool is sent into Yorkshire, to Linsithgow, or into Aberdeenshire, for the stocking manufacture; and some is woven here into a cloth called *plains*, and sold into England to be dressed. Here is also a considerable manufacture of white leather, chiefly to supply the capital of Scotland. At Kelfo there is a fine stone bridge of six arches over the Tweed near its confluence with the Teviot.

KEMPIS (Thomas à), a pious and learned regular canon, was born at the village of Kemp, in the diocese of Cologn, in 1380; and took his name from that village. He performed his studies at Deventer, in the community of poor scholars established by Gerard Groot; and there made a great progress in the sciences. In 1399, he entered the monastery of the regular canons of Mount St Agnes, near Zwol, of which his brother was prior. Thomas à Kempis there distinguished himself by his eminent piety, his respect for his superiors, his charity to his brother canons, and his continual application to labour and prayer. He died in 1471, aged 70. The best editions of his works, which consist of sermons, spiritual treatises, and lives of holy men, are those of Paris in 1649, and of Antwerp in 1607. The famous and well-known book *De Imitatione Christi*, which has been translated into almost all the languages of the world, though it has almost always been numbered among the works of Thomas à Kempis, is also found printed under the name of *Gerfon*; and on the credit of some MSS. has been since ascribed to the abbot Gerfon of the order of St Benedict. This has occasioned a violent dispute between the canons of St Augustine and the Benedictines: but while devout Christians find spiritual comfort in the work, the name of the writer is of small importance.

KEMPTEN, a free and imperial town of Germany, in Lower Suabia, and in Algow, and also in the territory of the abbot of Kempten, who is a prince of the empire, and has a voice in the diet. The inhabitants are Protestants; and it has been several times taken, but has always recovered its liberty. It is seated on the river Iller. E. Long. 10. 33. N. Lat. 47. 47.

KEMPTEN, a territory in the circle of Suabia, in Germany, between the bishopric of Augsburg and the

barony of Walburg. It is about 17 miles long and broad; and has no considerable place but the towns of Kempten and Kauffbeuren, which are imperial.

KEN (Thomas), an eminent English bishop in the 17th century, was bred at Winchester school, whence he went to Oxford; and in 1669 was made a prebend of Winchester. In 1675, the year of the Jubilee, he travelled to Rome; and used to say, He had reason to give God thanks for his travels, having returned more confirmed of the purity of the reformed religion than he was before. He was appointed by king Charles II. to attend the lord Dartmouth at the demolishing of Tangier; and at his return was made chaplain to his majesty, as he was some time after to the prince of Orange, then residing in Holland. In 1685 he was consecrated bishop of Bath and Wells. The month following he attended king Charles II. at his death; and gave close attendance at the royal bed for three whole days and nights, watching proper intervals to suggest pious and proper thoughts on so serious an occasion. In the following reign he zealously opposed the progress of Popery; and in June 1688, he, with five other bishops and the archbishop of Canterbury, was committed prisoner to the Tower of London for subscribing a petition to his majesty against the declaration of indulgence. Upon the Revolution, however, he refused to take the oaths to king William and Queen Mary, on which account he was deprived of his bishopric. Her Majesty queen Anne bestowed on him a yearly pension of 200l. to his death in 1710. He published several pious books. His charity was so great, that when he was bishop of Bath and Wells, having received a fine of 4000l. he gave a great part of it to the French Protestants.

KENDAL, a town of Westmoreland, seated in a valley, among hills, on the west side of the river Caa or Ken, over which there are two stone bridges, and one of wood which leads to the cattle now in ruins. It is a large handsome place; and has two long streets, which cross each other. The inhabitants have driven a trade with the cotton and woollen manufactory throughout England ever since the reign of Edw. III. and particular laws were enacted for regulating Kendal cloaths as early as Richard II. and Henry IV. It is of note also for the manufactory of cottons, druggets, ferges, hats, worsted and yarn stockings, &c. Queen Elizabeth incorporated it with aldermen and burgeses; and king James I. with a mayor, recorder, town-clerk, 12 aldermen, 24 burgeses or common councilmen, and 2 attorneys. There are 7 companies here, who have each their hall, viz. mercers, sheermen, cordwainers, glovers, tanners, taylors, and pewterers. Here is an elegant town-hall lately repaired; and they enjoy a court of conscience granted by George III. for debts under 40s. It has a large beautiful church, which stands on the other side of the brook called Blindbeck, out of the liberty of the town: a large neat and handsome building 180 feet long and 99 broad, with 5 aisles each parted by a row of 8 pillars, and a strong square steeple. Near is Abbot's-hall, the residence of the abbot when this church belonged to an abbey dissolved by Henry VIII. In 1755, a new chapel was erected in the middle of the town, besides which there are 12 chapels of ease belonging

belonging to it. The dissenters and quakers have meeting-houses. Here is a free grammar-school well endowed; and also a charity-school for 10 boys and 16 girls, who are all clothed as well as taught. Eastward of the town, on the opposite side of the river on a hill, from whence is a fine prospect, stand the ruins of a castle, wherein was born Catherine Parr (the sixth wife of Henry VIII.) By the late inland navigation, it has communication with the rivers Mercy, Dee, Ribble, Ouse, Trent, Darwent, Severn, Humber, Thames, Avon, &c. which navigation, including its windings, extends above 500 miles in the counties of Lincoln, Nottingham, York, Lancaster, Chester, Stafford, Warwick, Leicester, Oxford, Worcester, &c. Here are kept the sessions of the peace for this part of the county called the barony of Kendal; and there is a very great market on Saturday, with all kinds of provisions and woollen-yarn, which the girls bring hither in large bundles. It has fairs on May 6, and November 3; and between them a great beast-market every fortnight. The river here, which runs half through the town in a stony channel, abounds with trout and salmon; and on the banks of it live the dyers and tanners.

**KENNEL**, a term used indifferently for a puddle, a water-course in the streets, a house for a pack of hounds, and the pack or cry of hounds themselves.

Mr Beckford, in his Essay on Hunting, is very particular in describing a kennel for hounds; and a kennel he thinks indispensably necessary for keeping those animals in proper health and order. "It is true (says he) hounds may be kept in barns and stables; but those who keep them in such places can best inform you whether their hounds are capable of answering the purposes for which they are designed. The sense of smelling is so exquisite in a hound, that I cannot but suppose that every stench is hurtful to it. Cleanliness is not only absolutely necessary to the nose of the hound, but also to the preservation of his health. Dogs are naturally cleanly; and seldom, if they can help it, dung where they lie. Air and fresh straw are necessary to keep them healthy. They are subject to the mange; a disorder to which poverty and nastiness will very much contribute. The kennel should be situated on an eminence; its front ought to be to the east, and the courts round it ought to be wide and airy to admit the sun-beams at any time of the day. It is proper that it should be neat without and clean within; and it is proper to be near the master's house, for obvious reasons. It ought to be made large enough at first, as any addition to it afterwards may spoil it in appearance at least." Two kennels, however, in our author's opinion, are absolutely necessary to the well-being of hounds: "When there is but one (says he), it is seldom sweet; and when cleaned out, the hounds, particularly in winter, suffer both while it is cleaning and afterwards as long as it remains wet."

When the feeder first comes to the kennel in a morning, he should let out the hounds into the outer court; and in bad weather, should open the door of the hunting kennel (that in which the hounds designed to hunt next day are kept), lest want of rest should incline them to go into it. The lodging room should then be cleaned out, the doors and windows of it opened, the litter shaken up, and the kennel made sweet and clean before the hounds return to it again.—

VOL. IX. Part II.

The floor of each lodging-room should be bricked, and sloped on both sides to run to the centre, with a gutter left to carry off the water, that when they are washed they may soon be dry. If water should remain through any fault in the floor, it must be carefully mopped up; for damps are always very prejudicial.

The kennel ought to have three doors; two in the front and one in the back; the last to have a lattice-window in it with a wooden shutter, which is constantly to be kept closed when the hounds are in, except in summer, when it should be left open all the day.

At the back of Mr Beckford's kennel is a house thatched and furzed up on the sides, big enough to contain at least a load of straw. Here should be a pit ready to receive the dung, and a gallows for the flesh. The gallows should have a thatched roof, and a circular board at the posts to prevent vermin from climbing up. He advises to inclose a piece of ground adjoining to the kennel for such dog-horses as may be brought alive; it being sometimes dangerous to turn them out where other horses go, on account of the disorders with which they may be infected. In some kennels a stove is made use of; but where the feeder is a good one, Mr Beckford thinks that a mop properly used will render the stove unnecessary. "I have a little hay rick (says he) in the grass-yard, which I think is of use to keep the hounds clean and fine in their coats. You will frequently find them rubbing themselves against it. The shade of it is also useful to them in summer. If ticks at any time be troublesome in your kennel, let the walls of it be well washed; if that should not destroy them, the walls must then be white-washed."

Besides the directions already given concerning the situation of the kennel, our author recommends it to have a stream of water in its neighbourhood, or even running through it if possible. There should also be moveable stages on wheels for the hounds to lie on. The soil ought at all events to be dry.

**TO KENNEL**, a term applied by fox-hunters to a fox when he lies in his hole.

**KENNET** (Dr White), a learned English writer and bishop of Peterborough, in the 18th century, bred at St Edmund-hall, Oxford; where he soon distinguished himself by his vigorous application to his studies, and by his translations of several books into English, and other pieces which he published. In 1695 our author published his Parochial Antiquities. A sermon preached by him on the 30th of January 1703 at Aldgate exposed him to great clamour. It was printed under the title of *A compassionate inquiry into the causes of the civil war*. In 1706, he published his Case of Impropriations, and two other tracts on the same subject. In 1706, he published the third volume of The Complete History of England (the two former volumes compiled by Mr Hughes). In 1709, he published A Vindication of the Church and Clergy of England from some late reproaches rudely and unjustly cast upon them; and A true Answer to Dr Sacheverel's Sermon. When the great point in Dr Sacheverel's trial, the change of the ministry, was gained, and very strange addresses were made upon it, there was to be an artful address from the bishop and clergy of London, and they who would not subscribe it were to be represented as enemies to the queen and the ministry. Dr Kennet fell under this imputation. He was exposed

**Kennet**, to great odium as a low church man, on account of his conduct and writings. When he was dean of Peterborough, a very uncommon method was taken to expose him by Dr Walton, rector of the church of White-chapel: for in the altar-piece of that church, which was intended for a representation of Christ and his 12 apostles eating the passover and last supper, Judas the traitor was drawn sitting in an elbow-chair, dressed in a black garment, with a great deal of the air of Dr Kennet's face. It was generally said that the original sketch was for a bishop under Dr Walton's displeasure; but the painter being apprehensive of an action of *Scandalum Magnatum*, leave was given to drop the bishop, and make the dean. This giving general offence, upon the complaint of others (for Dr Kennet never saw it, or seemed to regard it), the bishop of London ordered the picture to be taken down. In 1713, he presented the society for propagating the gospel with a great number of books, suitable to their design; published his *Bibliotheca Americana Primordia*, and founded an antiquarian and historical library at Peterborough. In 1715, he published a sermon, intitled *The Wickedness of the present Rebellion*, and afterward several other pieces. In 1717, he was engaged in a dispute with Dr William Nicholson, bishop of Carlisle, relating to some alterations in the bishop of Bangor's famous sermon; and disliked the proceedings of the convocation against that bishop. Upon the death of Dr Cumberland bishop of Peterborough, he was promoted to that see, to which he was consecrated in 1718. He sat in it more than ten years, and died in 1728. He was an excellent philologist, a good preacher, whether in English or Latin, and well versed in the histories and antiquities of our nation.

**KENNET** (Babl), a learned English writer, and brother to the preceding, was educated in Corpus Christi college, in the university of Oxford, where he became fellow. In 1706, he went over chaplain to the English factory at Leghorn; where he met with great opposition from the Papists, and was in danger from the inquisition. He died in the year 1714. He published Lives of the Greek Poets; the Roman Antiquities; a volume of Sermons preached at Leghorn; A translation into English of Puffendorf's Treatise of the Law of Nature and Nations. He was a man of most exemplary integrity, generosity, piety, and modesty.

**KENNICOTT** (Dr Benjamin), well known in the learned world for his elaborate edition of the Hebrew Bible and other valuable publications, was born at Totness in Devonshire in the year 1718. With the rank and character of his parents we are entirely unacquainted; but it is certain they were unable to satisfy that thirst for knowledge which they could not but discover in their son. Some opportunities of early improvement must, however, have been afforded him, or (which we sometimes see) the natural vigour of his mind must have superseded the necessity of them. For in the year 1743, he wrote A Poem on the Recovery of the Hon. Mrs Eliz. Courtenay from her late dangerous Illness; and this probably recommended him to the notice of those gentlemen who afterwards sent him to Oxford and supported him there. In judging of this performance, they may be supposed to have considered not so much its intrinsic merit, as the circumstances under which it was produced. For though it might claim just praise as the fruit of youthful in-

dustry struggling with obscurity and indigence, as a poem it never rises above mediocrity, and generally sinks below it. But in whatever light these verses were considered, the publication of them was soon followed by such contributions as procured for the author the advantages of an academical education. In the year 1744 he entered at Wadham college; nor was it long before he distinguished himself in that particular branch of study in which he afterwards became so eminent. His two dissertations, On the Tree of Life, and The Oblations of Cain and Abel, came to a second edition so early as the year 1747, and procured him the singular honour of a bachelor's degree conferred on him *gratis* by the University a year before the statutable time. The dissertations were gratefully dedicated to those benefactors whose liberality had opened his way to the University, or whose kindness had made it a scene not only of manly labour, but of honourable friendship. With such merit, and such support, he was a successful candidate for a fellowship of Exeter college, and soon after his admission into that society, he distinguished himself by the publication of several occasional sermons. In the year 1753 he laid the foundation of that stupendous monument of learned industry, at which the wise and the good will gaze with admiration, when prejudice, and envy, and ingratitude, shall be dumb. This he did by publishing his first dissertation, On the State of the Printed Hebrew Text, in which he proposed to overthrow the then prevailing notion of its absolute integrity. The first blow, indeed; had been struck long before, by Cappellus, in his *Critica Sacra*, published after his death by his son, in 1650—a blow which Buxtorf, with all his abilities and dialectical skill, was unable to ward off. But Capellus having no opportunity of consulting MSS. though his arguments were supported by the authority of the Samaritan Pentateuch, of parallel passages, and of the ancient versions, could never absolutely prove his point. Indeed the general opinion was, that the Hebrew MSS. contained none, or at least very few and trifling variations from the printed text: and with respect to the Samaritan Pentateuch very different opinions were entertained. Those who held the Hebrew verity, of course condemned the Samaritan as corrupt in every place where it deviated from the Hebrew: and those who believed the Hebrew to be incorrect, did not think the Samaritan of sufficient authority to correct it. Besides, the Samaritan itself appeared to a very great advantage; for no Samaritan MSS. were then known, and the Pentateuch itself was condemned for those errors which ought rather to have been ascribed to the incorrectness of the editions. In this dissertation, therefore, Dr Kennicott, proved that there were many Hebrew MSS. extant, which, though they had hitherto been generally supposed to agree with each other, and with the Hebrew text, yet contained many and important various readings: and that from those various readings considerable authority was derived in support of the ancient versions. He announced the existence of six Samaritan MSS. in Oxford only, by which many errors in the printed Samaritan might be removed; and he attempted to prove, that even from the Samaritan, as it was already printed, many passages in the Hebrew might undoubtedly be corrected. This work, as it was reasonable to expect, was examined with great fer-

verity both at home and abroad. In some foreign universities the belief of the Hebrew verity, on its being attacked by Capellus, had been insilled on as an article of faith—*Ista Capelli sententia adeo non approbata fuit fidei sociis, ut potius Helvetii theologi, et speciatim Geneveses, anno 1678, peculiari canone caverint, ne quis in ditione sua minister ecclesie recipiatur, nisi fateatur publice, textum Hebraicum, ut hodie est in exemplaribus Masoreticis, quoad consonantes et vocales, divinum et authenticum esse,* (Wolffii Biblioth. Heb. tom. ii. 27). And at home this doctrine of the corrupt state of the Hebrew text was opposed by Comings and Bate, two Hutchinsonians, with as much violence as if the whole truth of the revelation were at stake.

The next three or four years of Dr Kennicott's life were principally spent in searching out and examining Hebrew MSS. though he found leisure not only to preach, but to publish several occasional sermons. About this time Dr Kennicott became one of the king's preachers at Whitehall; and in the year 1759 we find him vicar of Cullham in Oxfordshire. In January 1760 he published his second dissertation on the state of the Hebrew Text; in which, after vindicating the authority and antiquity of the Samaritan Pentateuch, he disarmed the advocates for the Hebrew verity of one of their most specious arguments. They had observed that the Chaldee Paraphrase having been made from Hebrew MSS. near the time of Christ, its general coincidence with the present Hebrew Text must evince the agreement of this last with the MSS. from which the paraphrase was taken. Dr Kennicott demonstrated the fallacy of this reasoning, by showing that the Chaldee Paraphrase had been frequently corrupted, in order to reconcile it with the printed text; and thus the weapons of his antagonists were successfully turned upon themselves. He appealed also to the writings of the Jews themselves on the subject of the Hebrew Text, and gave a compendious history of it from the close of the Hebrew canon down to the invention of printing, together with a description of 103 Hebrew MSS. which he had discovered in England, and an account of many others preserved in various parts of Europe. A collation of the Hebrew MSS. was now loudly called for by the most learned and enlightened of the friends of biblical criticism; and in this same year (1760) Dr Kennicott emitted his proposals for collating all the Hebrew MSS. prior to the invention of printing, that could be found in Great Britain and Ireland, and for procuring at the same time as many collations of foreign MSS. of note, as the time and money he should receive would permit. His first subscribers were the learned and pious Archbishop Secker, and the delegates of the Oxford presb. who with that liberality which has generally marked their character, gave him an annual subscription of 40l. In the first year the money received was about 500 guineas, in the next it arose to 900, at which sum it continued stationary till the tenth year, when it amounted to 1000. During the progress of the work the industry of our author was rewarded by a canonry of Christ Church. He was also presented, though we know not exactly when, to the valuable living of Mynhenyote, in Cornwall, on the nomination of the Chapter of Exeter. In 1776 the first volume was published, and in 1780 the whole was completed. If now we consider that

above 600 MSS. were collated, and that the whole work occupied 20 years of Dr Kennicott's life, it must be owned that sacred criticism is more indebted to him than to any scholar of any age. Within two years of his death, he resigned his living in Cornwall, from conscientious motives, on account of his not having a prospect of ever again being able to visit his parish. Although many good and conscientious men may justly think, in this case, that his professional labours carried on elsewhere might properly have intitled him to retain this preferment, and may apply this reasoning in other cases; yet a conduct so signally disinterested deserves certainly to be admired and celebrated. Dr Kennicott died at Oxford, after a lingering illness, Sept. 18, 1783; and left a widow, who was sister to the late Edward Chamberlayne, Esq; of the treasury. At the time of his death he was employed in printing *Remarks on Select Passages in the Old Testament*; which were afterwards published, the volume having been completed from his papers.

KENO. See KINO.

KENRICK (William), an author of considerable abilities, was the son of a citizen of London, and brought up, it is said, to a mechanical employment. This, however, he seems early to have abandoned; and to have devoted his talents to the cultivation of letters, by which he supported himself during the rest of a life which might be said to have passed in a state of warfare, as he was seldom without an enemy to attack or to defend himself from. He was for some time student at Leyden, where he acquired the title of J. U. D. Not long after his return to England, he figured away as a poet in *Epistles Philosophical and Moral*, 1759, addressed to Lorenzo; an avowed defence of infidelity, written whilst under confinement for debt, and with a declaration that he was "much less ambitious of the character of a poet than of a philosopher." From this period he became a writer by profession; and the Proteus shapes under which he appeared, it would be a fruitless attempt to trace. He was for a considerable time a writer in *The Monthly Review*; but quarrelling with his principal, began a *New Review* of his own. When our great Lexicographer's edition of Shakespeare first appeared in 1765, it was followed in a fortnight by a pamphlet, intitled, "A Review of Dr Johnson's new Edition of Shakespeare, in which the ignorance or inattention of that editor is exposed, and the poet defended from the persecution of his commentators, 1765." This pamphlet was followed by an Examination of it, and that by a Defence in 1766; in which year he produced his pleasant comedy of *Falstaff's Wedding*, at first intended to have been given to the public as an original play of Shakespeare retrieved from obscurity, and is, it must be acknowledged, a happy imitation of our great dramatic bard. With the celebrated English Roscius Dr Kenrick was at one time on terms of the strictest intimacy: but took occasion to quarrel with him in print, in a mode too unmanly to be mentioned. In politics also he made himself not a little conspicuous; particularly in the dispute between his friends Wilkes and Horne. He was the original editor of *The Morning Chronicle*; whence being ousted for neglect, he set up a new one in opposition. He translated in a very able manner the *Emilius* and the *Eloisa* of

Kensing-  
ton,  
Keat.

Rouffeau; the Elements of the History of England by Milot (to injure, if possible, a translation of the same work by Mrs Brooke); and produced several dramatic performances, together with an infinite variety of publications both original and translated. To him also the public are indebted for the collection (imperfect as it is) of The Poetical Works of Robert Lloyd, M. A. 1774, 2 vols 8vo. Dr Kenrick died June 9. 1777.

KENSINGTON, a village of Middlesex, on the western road from London, near 2 miles from Hide-Park-Corner. It is extremely populous; and besides the palace, now neglected, contains many genteel houses, and several boarding-schools. The palace, which was the seat of the Lord Chancellor Finch afterwards Earl of Nottingham, was purchased by King William; who greatly improved it, and caused a royal road to be made to it, through St James's and Hide Parks, with lamp-posts erected at equal distances on each side. Queen Mary enlarged the gardens. Her sister Queen Ann improved what Mary had begun; and was so pleased with the place, that she frequently supped during the summer in the green-house, which is a very beautiful one: but Queen Caroline completed the design by extending the gardens from the great road in Kensington to Acton; by bringing what is called the Serpentine-River into them; and by taking in some acres out of Hide-Park, on which she caused a mount to be erected, with a chair on it that could be easily turned round for shelter from the wind, since decayed. This mount is planted about with ever-greens, and commands a fine view over the noble gardens, and the country south and west. They were originally designed by Kent, and have lately been very much improved by Brown; and though they contain no striking beauties, which their flat situation will not admit, yet they have many pleasing parts, and afford much delight to the inhabitants of London, particularly to those whose professions will not allow of frequent excursions to more distant places. These gardens, which are three miles and a half in compass, are kept in great order. The palace indeed has none of that grandeur which ought to appear in the residence of a British monarch; but the royal apartments are noble, and some of the pictures good. It was at this place King William, Prince George of Denmark, Queen Ann, and King George II. died. The old church was pulled down in 1696, and a much better one built in its room. Part of this village, from the palace-gate to the Bell, is in the parish of St Margaret's, Westminster.

KENT, one of the counties of England, situated at the south-east corner of the island, and from thence enjoying many advantages. The capacious æstuary of the Thames washes its northern parts, as the sea does the south-east; whence some with no great impropriety have styled it a *peninsula*. In point of extent, this is the fifth shire in South Britain, little less in its dimensions than the province of Holland; larger in size than the duchy of Juliers in Germany; and almost exactly equal to that of Modena in Italy. Kent is, with great appearance of truth, supposed to be so styled from the ancient British word *kant*, signifying a *corner*, or, when applied to a country, an *head-land*. It is certain, that the Romans bestowed the name of

*Cantium* on the province, and on its most conspicuous promontory the north Foreland; and from the district they inhabited, the people were called *Cantii*; which has prevailed even to our times, when *Kent*, and the *the men of Kent*, are the common appellatives. It is however probable, that these Cantii were not the original inhabitants, but a latter colony from the opposite continent, established here, like the Belgæ, not long before the Roman invasion. At the time of Cesar's coming, this spacious and fertile region was divided into four principalities, or, as they are, according to the manners of those days, commonly called, *kingdoms*. It was his observation of these people, that they were particularly distinguished by their civility and politeness; a character which their descendants have preserved. When that wise people became masters of the southern parts of the island, this province received the most conspicuous marks of their attention, as appears from the stations which they so prudently established, while their government flourished in its full vigour. The care they took of the ports on the sea-coast as soon as it came to be in danger, and the several fortresses which they erected for the defence of their subjects against the sudden attempts of barbarous invaders, are evidences of the same kind. These forts, so prudently disposed, and so well secured, were under the direction of a particular great officer, called *Littoris Saxonici Comes*, i. e. the count of the Saxon shore; which office seems to have been preserved by the British monarchs who governed here, after the Romans quitted the isle. The Saxon kings of Kent discharged this trust in their legal capacity, from the middle of the fifth to the beginning of the ninth century. Under the northern princes, this post was again revived, though with a change of title, in the *Lord Warden of the cinque Ports*. Indeed, under all governments, the people of Kent have been especially considered; as appears from their claim to the post of honour in our land-armies, and the privileges granted to their havens, in consideration of their undertaking the defence of our channel.

As to the climate of this county, it varies according to the situation of places. In the low flat lands, and especially in the marshes, the air is heavy, moist, and unhealthy; and yet not to such a degree as it has been sometimes represented; for, with a little care and caution, strangers, as well as natives, quickly reconcile their constitutions to the temperature even of these parts, and live in them without much inconveniency or apparent danger. But, in reference to the rest of the country, the air is as thin, pure, and wholesome, as in any part of Britain. There is no region more happily or more beautifully diversified in regard to soil, so that every kind thereof is, somewhere or other, to be met with in its bounds; and in no shire are any of these soils more fertile than they are in this. The Weald yields variety of fine timber, particularly of chefnut; the middle part has very rich arable land, annually bearing every species of grain in immense plenty, and these excellent in their several sorts. There are also many beautiful orchards, which produce a variety of fine fruits, and more especially apples and cherries, which were introduced here from Flanders by one Richard Harris, who was the king's fruiterer, in the reign of Henry VIII. The flat country is re-

nowned

owned for its meadows; and Rumney-marsh has hardly its equal. We may from this concise description very easily collect, that the natural products of Kent are numerous, and of great value. In the bowels of the earth they find, in several places, a rough hard serviceable stone for paving, which turns to some advantage; but not so much as their exquisite fullers-earth, rich marl, and fine chalk, which are there in abundance. If we except iron-ore, indeed, they have no mines; but there are prodigious heaps of copper-stones thrown on the coast. The isle of Shepey, and all the adjacent shore as far as Reculver, is justly famous for its wheat. Thanet is in no less credit for its Barley, or rather was so; for now it produces, through the painful industry and skilful husbandry of its inhabitants, copious crops of good wheat as well as barley. Horses, black cattle, and sheep, they have in great numbers, and remarkable in point of size; and hop-grounds in all parts of the county, which turn to very considerable account. To which we may add, weld, or as some call it *dyers-weed*, which is a very profitable commodity, and of which there grows much in the neighbourhood of Canterbury; also madder, which is, or has been, occasionally cultivated. The rivers and sea-coasts abound with fish of different kinds. The excellency of its oysters on the eastern shore is celebrated by the Roman poets. Those of Faversham and Milton are not only in great esteem at the London market, but are likewise sent in great quantities to Holland.

The many rich commodities produced in this county, is the reason why most of our writers have represented it as in a manner void of manufactures; which, however, as appears upon a strict and impartial examination, is very far from being the case. Of iron-works there were anciently many; and there are still some, where kettles, bombs, bullets, cannon, and such like, are made. At Deptford Sir Nicholas Crispe had in his life-time a very famous copper-works; as, indeed, there that ingenious gentleman, one of the greatest improvers and one of the most public-spirited persons this nation ever bred, introduced several other inventions. Copper-works were also formerly made, together with brimstone, in the isle of Shepey\*. But the original and for many ages the principal manufacture of this county was broad cloth of different colours, established chiefly at Cranbrook by King Edward III. who brought over Flemings to improve and perfect (the trade being introduced long before) his subjects in that important art. At this and other places it flourished so much, that even at the close of Queen Elizabeth's reign, and according to some accounts much later, the best for home consumption, and the largest quantities for exportation, were wrought here; many fulling mills being erected upon almost every river, and the greatest plenty of excellent fullers-earth affording them singular assistance; inasmuch that it is still a tradition, that the yeomanry of this county, for which it has been ever famous, were mostly the descendants of rich clothiers, who laid out the money acquired by their industry in the purchase of lands, which they transmitted, with their free and independent spirit, to their posterity. The duke of Alva's persecution of the Protestants in the Low Countries drove a multitude of Walloons over hither, who brought with

them that ingenuity and application for which they had been always distinguished. These diligent and active people settled a manufactory of flannel or baize at Sandwich. By them the silk-looms were set up at Canterbury, where they still subsist; and they also introduced the making of thread at Maidstone, where it yet remains, and merits more notice and encouragement than hitherto it has met with.

Upon the river Dart, at the confluence of which with the Thames stands the town of Dartford, was set up, in the reign of Queen Elizabeth, the first mill for making white paper by Mr John Spilman, a German, upon whom, long after, King James conferred the honour of knighthood; but King Charles more sensibly bestowed upon this Sir John Spilman a patent and a pension of 200*l.* a-year, as a reward of his invention, and for the support of the manufacture. About the year 1590, Godfrey Box, a German, erected upon the same river the first sitting-mill which was ever used for making iron-wire; and also the first battery-mill for making copper-plates. Other new inventions, requiring the assistance of water, have been set up on other streams; and a great variety of machines of this sort still subsist in different parts of this county. But these things are now so common, that it would be both tedious and useless to insist upon them. Amongst these, we may reckon the making gunpowder in several places. That manufacture, however, which is now the glory of this county, and indeed of Britain, is ship-building; more especially at the royal yards; as at Woolwich, which was settled by Henry VIII. and some considerable ships built there. At present, there is not only a most complete establishment for the building and equipping men of war, a rope walk, foundery, and magazines; but also many private docks, in which prodigious business is carried on, and multitudes of people are employed.

KENTISH-TOWNS, a village of Middlesex, three miles north of London, near Hampstead, much improved of late by several handsome houses belonging to the citizens of London, &c. A new chapel has lately been erected here.

KENTUCKY, a province of North America, belonging at present to the state of Virginia, but proposed soon to be admitted into the union as an independent state. It is situated between 36° 30' and 39° 30' North Latitude, and 8° and 15° West Longitude; being 250 miles in length, and 200 in breadth. It is bounded north-west by the river Ohio; west, by Cumberland river; south, by North Carolina; east, by Sandy-river, and a line drawn due south from its source till it strikes the northern boundary of North Carolina. Kentucky was originally divided into two counties, Lincoln and Jefferson. It has since been subdivided into seven, viz. Jefferson, Fayette, Bourbon, Mercer, Nelson, Madison, Lincoln; and Lexington is the chief town.

The river Ohio washes the north-western side of Kentucky, in its whole extent. Its principal branches, which water this fertile tract of country, are Sandy, Licking, Kentucky, Salt, Green, and Cumberland rivers. These again branch into various directions, into rivulets of different magnitudes, fertilizing the country in all its parts.—There are five noted salt springs

Kent  
||  
Kentucky.

Kentucky. springs or licks in this country, viz. the higher and lower Blue Springs on Licking river, from some of which, it is said, issue streams of brinish water; the Big Bone lick, Drennon's licks, and Bullet's lick at Salsburg. The last of these licks, though in low order, has supplied this country and Cumberland with salt at 20 shillings the bushel, Virginia currency; and some is exported to the Illinois country. The method of procuring water from these licks is by sinking wells from 30 to 40 feet deep. The water drawn from these wells is more strongly impregnated with salt than the water from the sea.

This whole country, as far as has yet been discovered, lies upon a bed of lime-stone, which in general is about six feet below the surface, except in the valleys where the soil is much thinner. A tract of about 20 miles wide along the banks of the Ohio is hilly broken land, interspersed with many fertile spots. The rest of the country is agreeably uneven, gently ascending and descending at no great distances. This country in general is well timbered; and such is the variety and beauty of the flowering shrubs and plants which grow spontaneously in it, that in the proper season the wilderness appears in blossom. The accounts of the fertility of the soil in this country have in some instances exceeded belief, and probably have been exaggerated. That some parts of Kentucky, particularly the high grounds, are remarkably good, all accounts agree. The lands of the first rate are too rich for wheat, and will produce 50 and 60, and in some instances it is affirmed 100 bushels of good corn an acre. In common the land will produce 30 bushels of wheat or rye an acre. Barley, oats, cotton, flax, hemp, and vegetables of all kinds common in this climate, yield abundantly. The old Virginia planters say, that if the climate does not prove too moist, few soils known will yield more and better tobacco.—The climate is healthy and delightful, some few places in the neighbourhood of ponds and low grounds excepted. The inhabitants do not experience the extremes of heat and cold. Snow seldom falls deep or lies long. The winter, which begins about Christmas, is never longer than three months, and is commonly but two, and is so mild as that cattle can subsist without fodder.

It is impossible to ascertain with any degree of accuracy the present number of inhabitants, owing to the numerous accessions which are made almost every month. In 1783, in the county of Lincoln only, there were on the militia rolls 3570 men, chiefly emigrants from the lower parts of Virginia. In 1784 the number of inhabitants were reckoned at upwards of 30,000. From the accounts of their astonishing increase since, we may now safely estimate them at 1,000,000. It is asserted that at least 20,000 migrated here in the year 1787. These people, collected from different states, of different manners, customs, religions, and political sentiments, have not been long enough together to form a uniform and distinguishing character. Among the settlers there are many gentlemen of abilities, and many gentel families from several of the states, who give dignity and respectability to the settlement. They are in general more orderly perhaps than any people who have settled a new country.

As to religion, the Baptists are the most numerous sect in Kentucky. In 1789 they had 16 churches

established, besides several congregations where churches were not constituted. These were supplied with upwards of 30 ministers or teachers. There are several large congregations of Presbyterians, and some few of other denominations.

The legislature of Virginia have made provision for a college in Kentucky, and have endowed it with very considerable landed funds. Schools are established in the several towns, and in general regularly and handsomely supported. They have a printing office, and publish a weekly gazette. They have erected a paper-mill, an oil mill, fulling mills, saw mills, and a great number of valuable grist mills. Their salt works are more than sufficient to supply all the inhabitants at a low price. They make considerable quantities of sugar from the sugar trees. Labourers, particularly tradesmen, are exceedingly wanted here.

The first white man who discovered this province was one James M<sup>r</sup>Bride, in the year 1754. From this period it remained unexplored till about the year 1767, when one John Finley and some others, trading with the Indians, fortunately travelled over the fertile region now called Kentucky, then but known to the Indians by the name of the Dark and Bloody Grounds, and sometimes the Middle Ground. This country greatly engaged Mr Finley's attention, and he communicated his discovery to Colonel Daniel Boon, and a few more, who conceiving it to be an interesting object, agreed in the year 1769 to undertake a journey in order to explore it. After a long fatiguing march over a mountainous wilderness, in a westward direction, they at length arrived upon its borders; and from the top of an eminence, with joy and wonder descried the beautiful landscape of Kentucky. Here they encamped, and some went to hunt provisions, which were readily procured, there being plenty of game, while Colonel Boon and John Finley made a tour through the country, which they found far exceeding their expectations; and returning to camp, informed their companions of their discoveries. But in spite of this promising beginning, this company meeting with nothing but hardships and adversity, grew exceedingly disheartened, and was plundered, dispersed, and killed by the Indians, except Colonel Boon, who continued an inhabitant of the wilderness until the year 1771, when he returned home.

Colonel Henderson of North Carolina being informed of this country by Colonel Boon, he and some other gentlemen held a treaty with the Cherokee Indians at Wataga in March 1775, and then purchased from them the lands lying on the south side of Kentucky river for goods at valuable rates, to the amount of 6000 l. specie.

Soon after this purchase, the state of Virginia took the alarm, agreed to pay the money Colonel Donaldson had contracted for, and then disputed Colonel Henderson's right of purchase, as a private gentleman of another state in behalf of himself. However, for his eminent services to this country, and for having been instrumental in making so valuable an acquisition to Virginia, that state was pleased to reward him with a tract of land at the mouth of Green river, to the amount of 200,000 acres; and the state of North Carolina gave him the like quantity in Powel's Valley. This region was formerly claimed by various tribes of Indians;

per. Indians; whose title, if they had any, originated in such a manner as to render it doubtful who ought to possess it. Hence this fertile spot became an object of contention, a theatre of war, from which it was properly denominated the Bloody Grounds. Their contentions not being likely to decide the right to any particular tribe, as soon as Mr Henderson and his friends proposed to purchase, the Indians agreed to sell; and notwithstanding the valuable consideration they received, have continued ever since troublesome neighbours to the new settlers.

The progress in improvements and cultivation which has been made in this country, almost exceeds belief. Eleven years ago Kentucky lay in forest, almost uninhabited but by wild beasts. Now, notwithstanding the united opposition of all the western Indians, she exhibits an extensive settlement, divided into seven large and populous counties, in which are a number of flourishing little towns, containing more inhabitants than are in Georgia, Delaware, or Rhode-Island states; and nearly or quite as many as in New Hampshire.

KEPLER (John), one of the greatest astronomers of his age, was born at Wied, in the country of Württemberg, in 1571. In the year 1595, he wrote an excellent book, which was printed at Tübingen the year following, under the title of *Prodromus dissertationum de proportione orbium celestium, deque causis colorum numeri, magnitudinis, motuumque periodicorum genuinis et propriis, &c.* Tycho Brahe having settled in Bohemia, and obtained from the emperor all sorts of conveniences for the perfecting of astronomy, was so passionately desirous of having Kepler with him, and wrote so many letters to him on that subject, that he prevailed upon him to leave the university of Gratz, and remove into Bohemia with his family and library in the year 1600. Kepler in his journey was seized so violently with the quartan ague, that he could not do Tycho Brahe all the services of which he was before capable. He was even a little dissatisfied with the reservedness which Tycho Brahe showed towards him; for the latter did not communicate to him all he knew: and as he died in 1604, he did not give time to Kepler to be very useful to him, or to receive any considerable advantage under him. From that time Kepler enjoyed the title of *Mathematician to the emperor* all his life; and gained more and more reputation by his works. The emperor Rodolphus ordered him to finish the tables of Tycho Brahe, which were to be called the *Rodolphine Tables*. Kepler applied himself to it vigorously; but unhappy are those learned men who depend upon the good-humour of the intendants of the finances. The treasurers were so ill-affected toward our author, that he could not publish these tables till 1627. He died at Ratibon, where he was soliciting the payment of the arrears of his pension in 1630.

The principal works of this great astronomer are, 1. *Prodromus dissertationum* above mentioned, to which he has also given the title of *Mysterium Cosmographicum*; which he esteemed more than any other of his works, and was for some time so charmed with it, that he said he would not give up the honour of having invented what was contained in that book for the electorate of Saxony. 2. *Harmonia mundi*, with a defence of that

treatise. 3. *De cometis, libri tres.* 4. *Epitome astronomie Copernicanae.* 5. *Astronomia nova.* 6. *Chilias logarithmorum, &c.* 7. *Nova stereometria solidorum vinariorum, &c.* 8. *Dioptrice.* 9. *De vero natali anno Christi.* 10. *Al Fideiionem Paralipomena, quibus Astronomie pars optica traditur, &c.* 11. *Somnium Lullarise Astronomia*; in which he began to draw up that system of comparative astronomy which was afterwards pursued by Kircher, Huygens, and Gregory. His death happened while the work was printing; upon which James Bartolus his son-in-law undertook the care of the impression, but was also interrupted by death: and Lewis Kepler his son, who was then a physician at Königsberg in Prussia, was so much startled at these disasters, that it was with the utmost difficulty he could be prevailed upon to attempt to finish it, lest it should prove fatal to him: he completed the task, however, without receiving any personal injury.

KERATOPHYTUM, in natural history, a species of GORGONIA.—The keratophyta are called the *frutices corallides*, or sea shrubs; and generally known among naturalists by the different appellations of *litophyta*, *litoxyla*, and *keratophyta*; epithets tending to convey an idea of their composition, which at first view seems to consist partly of a woody or horny, partly of a stony or calcareous substance, variously disposed with respect to each other. Their general form approaches to that of shrubs, having a root-like base, by which they adhere to some solid support in the ocean; and a stem or trunk, and branches differently disposed; some rising up in one or more different twigs, subdivided into smaller and separate ramifications; while others have their smaller branches connected in such a manner, as to form a curious net-like structure: from this diversity of figure they borrow the names of *sea fans*, *sea-feathers*, &c. The seeming fibres of the base are, in reality, small tubes, of which the whole shrub consists; these tubes run up longitudinally into the trunk, and are also circularly disposed about the centre of the trunk; the woody part, as naturalists have called it, thus formed, affords when burnt a strong smell like burning horn; whence some have called it *the horny part*. Upon this part is superinduced a kind of stony or calcareous coat, which covers both trunk and branches to their extremities. In this coat may be discovered regular orders or pores of cells; and viewed by the microscope, it always appears to be an organical body consisting of a regular congeries, like the cells in which animals have been formed or existed. Some of this kind of bodies have lost their calcareous covering by the violence of the waves and other accidents. In some specimens of an advanced growth, the calcareous tubes just mentioned send out little cells of animals of the polype kind, with proper openings to them all: these cells are diffused along the branches in some regular order, much in the same manner as they are in the corallines. From the cells the animals have been discovered extending themselves, as well to procure food, as materials for the increase of this surprising structure; and therefore there is no reason to doubt that they are animal productions.

A small sprig of the keratophyton stabelliforme, or warted sea-fan, is represented in Plate CCL. The outside is covered with a crust full of little lumps.

Kerckring  
||  
Kermes.

lumps like warts; which, when dissolved in vinegar, discover the contracted bodies of polyptes, like claws. C and C<sub>1</sub> are two views of one of the warts magnified; C<sub>2</sub>, is the appearance of the polype when the cretaceous matter is dissolved; C<sub>3</sub>, represents the particles that compose the incrustation, magnified.—D, represents a sea-willow, or keratophyton dichotomum. On both edges of the flat branches are regular rows of little rising cells in the calcareous part, with small holes for an entrance to each. See CORALLINES.

KERCKRING (Theodore), a famous physician of the 17th century, was born at Amsterdam, and acquired a great reputation by his discoveries and his works. He found out the secret of softening amber without depriving it of its transparency; and made use of it in covering the bodies of curious insects in order to preserve them. He was a member of the Royal Society of London, and died in 1693 at Hamburg, where he had spent the greatest part of his life, with the title of *resident of the grand duke of Tuscany*. His principal works are, 1. *Spicilegium anatomicum*. 2. *Antropogenie ichnographia*. There is also attributed to him an anatomical work, printed in 1671 in folio.

KERI CETIB, are various readings in the Hebrew Bible: *keri*, signifies that which is read; and *cetib*, that which is written. For where any such various readings occur, the wrong reading is written in the text, and that is called the *cetib*; and the true reading is written in the margin, with  $\aleph$  under it, and called the *keri*. It is generally said by the Jewish writers, that these corrections were introduced by Ezra; but it is most probable, that they had their original from the mistakes of the transcribers after the time of Ezra, and the observations and corrections of the Masorites. Those Keri cetibs, which are in the sacred books written by Ezra himself, or which were taken into the canon after his time, could not have been noticed by Ezra himself; and this affords a presumption, that the others are of late date. These words amount to about 1000; and Dr Kennicott, in his *Dissertatio Generalis*, remarks, that all of them, excepting 14, have been found in the text of manuscripts.

KERMAN, the capital city of a province of that name in Persia, seated in E. Long. 56. 30. N. Lat. 30. 0. The province lies in the south part of Persia, on the Persian gulph. The sheep of this country, towards the latter end of the spring, shed their wool, and become as naked as suckling pigs. The principal revenue of the province consists in these fleeces.

KERMES, in zoology, the name of an insect produced in the excrescences of a species of the oak. See COCCUS.

*KERMES Mineral*, so called from its colour, which resembles that of vegetable kermes, is one of the most important antimonial preparations, both with regard to its chemical phenomena and to its medicinal uses.

The use of kermes-mineral was not established in medicine before the beginning of this century. Some chemists, indeed, amongst others Glauber and Lemer, had before that time mentioned in their works several preparations of antimony which approach more or less to kermes; but these preparations being little known, were confounded with many others which are entirely

N<sup>o</sup> 172.

neglected, although much praised by their authors.—The fame of kermes was occasioned by friar Simon, apothecary to the Chartreux friars. He received this preparation from a surgeon called *La Ligerie*, who had procured it from a German apothecary who had been a scholar of the famous Glauber. Friar Simon, from the commendations given to this new remedy by *La Ligerie*, administered it to a Chartreux friar, who was dangerously ill of a violent peripneumony, by which the friar was suddenly, and as it had been miraculously, cured. From that time the friar-apothecary published the virtue of his remedy. Several other remarkable cures were performed by means of kermes. The public believed in its medicinal qualities, and called it *powder of Chartreux*; because it was prepared only in the apothecary's shop belonging to these monks. The reputation of kermes extended itself more and more; till at length the duke of Orleans, then regent of France, procured the publication of the process by *La Ligerie*.

This process consists in boiling, during two hours, pulverised crude antimony in the fourth part of its weight of the liquor of nitre fixed by coals, and twice its weight of pure water: at the end of this time the liquor is to be decanted and filtrated, while boiling, through brown paper. It continues clear while it is boiling hot; but when it cools, it becomes turbid, acquires a red brick colour, and again becomes clear by the deposition of a red sediment, which is the kermes. The boiling may be thrice repeated, and each time the same quantity of water is to be added to the antimony, and a fourth part less of the liquor of fixed nitre. The several sediments from these three boilings are to be added together, washed with clean water till the water acquires no taste; and the kermes is then to be dried. *La Ligerie* directs, that aquavita shall be once or twice poured upon it and burnt, and the kermes dried again.

We now proceed to explain the nature of kermes, and the phenomena of its preparation.—Crude antimony is composed of regulus of antimony and common sulphur, united naturally with each other, as in almost all metallic minerals. The fixed alkali with which the crude antimony is boiled, although it is diluted with much water, acts upon the sulphur of the antimony, and forms with it liver of sulphur; and as this compound is a solvent of all metallic matters, it dissolves a certain quantity of the regulus of antimony. In this operation then a combination is formed of fixed alkali, of sulphur, and of regulus of antimony. Of these three substances the fixed alkali only is soluble in water, and is the intermediate substance by which the sulphur and regulus are suspended in the water. But we are to observe, that the alkali becomes impregnated by this operation, and by boiling, with a larger quantity of regulus, and especially of sulphur, than can be suspended in cold water; hence the decoction of kermes, which is clear, limpid, and colourless while boiling hot, becomes turbid and deposits a sediment while it cools. This compound, therefore, like certain salts, may be kept dissolved in larger quantity by hot than by cold water, and much of it is therefore deposited by cooling.

Further, while the kermes is precipitating, the whole

whole antimoniated liver of sulphur, which is dissolved by the boiling liquor, may be divided into two parts; one of which, that is the kermes, being overcharged with the regulus, and particularly with the sulphur, contains but a little alkali, which it draws along with it during its deposition. The other part, as it contains much more alkali, remains dissolved even in the cold liquor, by means of this larger quantity of alkali. All these propositions are to be explained and demonstrated by the following observations.

First, when the decoction of kermes is cold, and has formed all its sediment, if, without adding anything to it, it be heated till it boil, it again entirely redissolves the kermes; the sediment disappears; the liquor becomes clear, and by cold is again rendered turbid and deposits sediment as before. Thus the kermes may be made to precipitate and to redissolve as often as we please.

Secondly, by digesting kermes in aqua regia, which dissolves its alkali and regulus, the sulphur is separated pure. The acids of aqua regia form a nitre and a febrifugal salt of Sylvius with the alkali of the kermes; and if a certain quantity of kermes be melted with black flux after having destroyed its sulphur by roasting, a true regulus of antimony may be obtained from it.

These experiments, which were made by Mr Geoffroy, and the detail of which is found in memoirs given to the Academy in the years 1734 and 1735, upon the analysis of kermes, show evidently the presence of sulphur, of fixed alkali, and of regulus of antimony, in this compound. From Mr Geoffroy's experiments we find, that 72 grains of kermes contain about 16 or 17 grains of regulus, 13 or 14 grains of alkaline salt, and 40 or 41 grains of common sulphur.

Thirdly, by repeating the boiling of the liquor upon the antimony, more and more kermes will be formed each time by cooling, as at first; and this experiment may be repeated a great many times. Mr Geoffroy says, that he repeated it 78 times without any other addition than that of pure water to supply that which was lost by evaporation; and that each time a considerable quantity of kermes was formed by cooling. This experiment proves, that the alkali transforms the antimony into kermes by overcharging itself with regulus and sulphur, and at each precipitation the kermes does not retain and take with it but a very small quantity of alkali.

Fourthly, if any acid be poured upon the liquor in which the kermes has been formed, and from which it has been entirely separated by cooling, Mr Beaumè has observed, that this liquor is again rendered turbid, and that a second sediment is formed of a yellow reddish colour, which is nothing else than golden sulphur of antimony; that is, regulus of antimony and sulphur mixed together, but in very different proportions, and with very different strengths of union, from those in which they are found in the crude antimony.

After this precipitation, in the liquor a neutral salt is left, which is formed by the contained alkali and the precipitating acid. From this experiment we find, that in the liquor from which the kermes has been deposited, a considerable quantity of antimoniated liver of sulphur remains, which differs from kermes by

containing a much larger proportion of alkali; so that it can keep dissolved the regulus and sulphur with which it is united, even when the liquor is cold.

In the process for several antimonial preparations, a kermes, or compounds like it, are formed. This always happens when crude antimony is treated by fusion with a quantity of alkaline salt, so that an antimoniated liver of sulphur results from it, overcharged with regulus and sulphur; that is, containing more of these two substances than it can keep dissolved in cold water. If any of these combinations be boiled in water, a matter analogous to kermes is always deposited by cooling. This happens, for instance, to the scoria of the regulus of antimony, and in an operation described by Mr Geoffroy to abridge the process for making kermes by fusion.

To make kermes by fusion, Mr Geoffroy fuses two parts of antimony with one part of alkaline salt; he powders this matter while yet hot, and keeps it during two hours in boiling water; he then filtrates it, and receives the liquor into more boiling water, from which, when it cools, about six gros of kermes is deposited, when an ounce of antimony has been used. This method of making kermes is much more expeditious, but less perfect; for, as the author confesses, the kermes produced is not so fine and soft as that made in the ordinary method.

Mr Lemerie the elder mentions also, in his Treatise concerning Antimony, an operation from which his son pretends that kermes may be obtained. This operation consists in digesting, and afterwards boiling, powdered crude antimony in a very pure liquor of fixed nitre. This liquor, if it be in sufficient quantity, is capable of dissolving quickly and entirely powdered crude antimony; and we cannot doubt but that, by cooling, a considerable quantity of a substance very analogous to kermes will be produced. Nevertheless, none of these short methods of making kermes is directed by dispensatories, or by the best books for describing the preparations of chemical remedies.

Kermes is used in medicine only; and from it singularly excellent effects may be produced, when administered by able physicians. In kermes are united the exciting and evacuant virtues of the emetic preparations of antimony, with the tonic, dividing, aperitive, and resolving properties of the liver of sulphur; that is to say, that it is capable of answering two principal indications in the treatment of many acute and chronic diseases. Properly managed, it may become an emetic, purgative, a diuretic, a sudorific, or an expectorant, as is required, and it is always attenuating and resolving. When seven or eight grains are taken at once, it chiefly acts upon the primæ viæ, generally as an emetic and as a purgative. A dose of three or four grains is seldom emetic, and more frequently purgative. When taken in these quantities as an evacuant, a little of it passes also into the viæ secundæ & tertiæ. When it is administered in smaller doses, it passes almost entirely into the lacteal, blood, and lymphatic vessels. In these it occasions such spasms and oscillations as it does in the primæ viæ; so that it increases all secretions and excretions, but particularly those of urine, sweat, and expectoration, according to the dose, to the nature of the disease, and to the disposition of the patient. It produces very good effects in those

Kern,  
Kerry.

diseases of the breast which proceed from fullness and obstruction.

Kermes may be administered in lactuses, in oily or in cordial potions, in any vehicle; or incorporated in a bolus, with other suitable remedies. One precaution, hitherto little observed, is very necessary; that is, not to join it with acid matters, if it is intended to act as kermes. Anti-acid and absorbent substances ought to be joined with it, if the patient has an acid in the primæ viæ, or an ascendent disposition; for as these acids saturate the alkali by which the kermes is rendered an antimoniated liver of sulphur, and by which alone it differs from golden sulphur of antimony, they accordingly render the kermes entirely similar to the golden sulphur of antimony, the properties of which are very different from those of kermes.

KERN, or KERNE, a term in the ancient Irish militia, signifying a *foot-soldier*.—Camden tells us, the armies of Ireland consisted of cavalry, called *galloglasses*; and infantry, lightly armed, called *kernes*.—The kernes bore swords and darts; to the last were fitted cords, by which they could recover them after they had been launched out.

KERNES, in our laws, signify idle persons or vagabonds.

KERRY, a county of Ireland, in the province of Munster, anciently called *Corrigia*, or “the rocky country,” from *Cerrig* or *Carrie*, “a rock.” It is bounded by the Shannon which divides it from Clare on the north, by Limerick and Cork on the east, by another part of Cork on the south, and by the Atlantic Ocean on the west. The best town in it is Dingle, situated in a bay of the same name. It comprehends a great part of the territory formerly called *Dismond*, and consists of very different kinds of soil. The south parts are plain and fertile, but the north full of high mountains, which, though remarkably wild, produce a great number of natural curiosities. It contains 636,905 Irish plantation acres, 84 parishes, 8 baronies, 3 boroughs, returns 8 members to parliament, and gives title of earl to the family of Fitzmaurice. It is about 57 miles long, 45 broad, and lies within N. Lat. 51. 30. and 52. 24.; the Longitude at the mouth of Kenmare river being 10° 35' west, or 42' 20" difference of time with London. It is the fourth county as to extent in Ireland, and the second in this province; but in respect to inhabitants and culture doth not equal many smaller counties. In it there are two episcopal sees, which have been annexed to the bishopric of Limerick since the year 1660, viz. Ardfert and Aghadoe. The see of Ardfert was anciently called the diocese of *Kerry*, and its bishops were named bishops of *Kerry*. Few mountains in Ireland can vie with those in this county for height; during the greater part of the year their sides are obscured by fogs, and it must be a very serene day when their tops appear. Iron ore is to be had in great plenty in most of the southern baronies. The principal rivers are the Blackwater, Feal, Gaic and Brick, Cashin, Maug, Lea, Hekk, Launc, Carrin, Fartin, Inry, and Roughity, and the principal lake is Killarney. There are some good medicinal waters discovered in this county; particularly Killarney water, Iveragh, Spa, Fellofswell, Dingle, Cattlemain, and Fralce-Spas, as also a saline spring at Malerybeg. Some rare and useful plants

grow in Kerry, of which Dr Smith gives a particular account in his history of that county.

KERSEY, a kind of coarse woollen cloth, made chiefly in Kent and Devonshire.

KESITAH. This word is to be met with in Genesis and in Job, and is translated in the Septuagint and Vulgat “sheep or lambs:” But the Rabbins and modern interpreters are generally of opinion, that kesitah signifies rather a piece of money. Bochart and Eusebius are of opinion the Septuagint meant *mina*, and not lambs; in Greek *becatonnumon*, *εκατονομμων*, instead of *εκατον αρων*. Now a mina was worth 60 Hebrew shekels, and consequently 6l. 16s. 10½ d. Sterling. M. de Pelletier of Rouen is of opinion, that kesitah was a Persian coin, stamped on one side with an archer (*Kesitah* or *Kesib* in Hebrew signifying “a bow”) and on the other with a lamb; that this was a gold coin known in the east by the name of a *daric*, and was in value about 12 livres and 10 d. French money. Several learned men, without mentioning the value of the kesitah, say it was a silver coin, the impression whereof was a sheep, for which reason the Septuagint and Vulgate translate it by this name. Calmet is of opinion, that kesitah was a purse of gold or silver. In the east they reckon at present by purses. The word *kisla* in Chaldee signifies “a measure, a vessel.” And Eustathius says, that *kisla* is a Persian measure. Jonathan and the Targum of Jerusalem translate *kesitah* “a pearl.” (Gen. xxxiii. 19.; Job, xlii. 11). Or 9l. English, supposing, as Dr Prideaux does, that a shekel is worth 3s. A daric is a piece of gold, worth, as Dr Prideaux says, 25 s. English.

KESSEL, a town of Upper Guelderland, in the Netherlands, with a handsome castle. It is the chief town in the territory of the same name, and seated on the river Meuse, between Ruremond and Venlo, it being about five miles from each. It was ceded to the king of Prussia by the treaty of Utrecht. E. Long. 6. 13. N. Lat. 41. 22.

KESSEL (John Van), an eminent painter, was born at Antwerp in 1626, and became exceedingly famous for painting those particular objects which he delighted to represent; and not only excelled in fruits and flowers, but was likewise eminent for painting portraits. In this manner he resembled Velvet Brueghel, and very near equalled him in his birds, plants, and flowers. The prodigious high prices for which he sold his works, occasioned the rich alone to be the purchasers; and the king of Spain admired the performances of Van Kessel to such a degree, that he purchased as many of them as he could possibly procure, till at last he prevailed on that artist to visit his court, where he was appointed painter to the queen, and was retained in her service as long as she lived. He painted portraits admirably, with a light free touch, and a tone of colour that very much resembled Vandyck; nor are his works in that style considered in Spain as inferior to that great master. He died in 1708, aged 82.

KESSELDORF, a village of Germany, in the circle of Upper Saxony, three miles below Dresden, remarkable for the battle gained by the king of Prussia over the Saxons, on the 15th of December 1745.

KESTREL, the English name of a hawk, called also the *stannel* and the *windhover*, and by authors the *tinunculus* and *chencris*. It builds with us in hollow.

ck hollow oaks, and feeds on partridges and other birds.  
See FALCO.

well. KESWICK, a town of Cumberland, situated on the side of a lake in a fruitful plain, almost encompassed with mountains, called the *Terwent Fells*. It was formerly a town of good note, but now is much decayed. However, it is still noted for its mines and miners, who have a convenient smelting-house on the side of the river Derwent, the stream of which is so managed as to make it work the bellows, hammers, and forge, as also to saw boards. There is a work-house here for employing the poor of this parish and that of Crosthwaite. W. Long. 3. 0. N. Lat. 54. 30.

KETCH, a vessel equipped with two masts, viz. the main-mast and mizen-mast, and usually from 100 to 250 tons burden.—Ketches are principally used as yachts or as bomb-vessels; the former of which are employed to convey princes of the blood, ambassadors, or other great personages, from one part to another; and the latter are used to bombard citadels, towns, or other fortresses. The bomb-ketches are therefore furnished with all the apparatus necessary for a vigorous bombardment; they are built remarkably strong, as being fitted with a greater number of *riders* than any other vessel of war; and indeed this reinforcement is absolutely necessary to sustain the violent shock produced by the discharge of their mortars, which would otherwise in a very short time shatter them to pieces.

KETTLE, in the art of war, a term the Dutch give to a battery of mortars, because it is sunk under ground.

*KETTLE-Drums*, are formed of two large basins of copper or brass, rounded at the bottom, and covered over with vellum or goat-skin, which is kept fast by a circle of iron, and by several holes fastened to the body of the drum, and a like number of screws to screw up and down, and a key for the purpose. The two basins are kept fast together by two straps of leather which go through two rings, and are fastened the one before and the other behind the pommel of the kettle-drums saddle. They have each a banner of silk or damask, richly embroidered with the sovereign's arms or with those of the colonel, and are fringed with silver or gold; and, to preserve them in bad weather, they have each a cover of leather. The drumsticks are of crab-tree or of any other hard wood, of eight or nine inches long, with two knobs on the ends, which beat the drum-head and cause the sound. The kettle drum with trumpets is the most martial found of any. Each regiment of horse has a pair.

*KETTLE-Drummer*, a man on horseback appointed to beat the kettle-drums, from which he takes his name. He marches always at the head of the squadron, and his post is on the right when the squadron is drawn up.

KET'LEWELL (John), a learned divine, born in 1653, was descended from an ancient family in the North-riding of Yorkshire, bred in Edmund-Hall Oxford, and elected fellow of Lincoln college. In 1675, he went into orders; but after the revolution was deprived of his living, on account of his refusal to take the oaths to King William and Queen Mary. He died of a consumption in 1695. He published several works, which were collected and reprinted together in 1718, in

2 vols folio. He was a man of great candour, meekness, piety, and charity.

KEVELS, in ship-building, a frame composed of two pieces of timber, whose lower ends rest in a sort of step or foot, nailed to the ship's side, from whence the upper ends branch outward into arms or horns, serving to belay the great ropes by which the bottoms of the main-sail and fore sail are extended.

KEW, a village of Surry in England, opposite to Old Brentford, 10 miles west from London. Here is a chapel of ease erected at the expense of several of the nobility and gentry in the neighbourhood, on a piece of ground that was given for that purpose by the late Queen Anne. Here the late Mr Molineux secretary to the late king, when prince of Wales, had a fine seat on the Green, which became the residence of the late prince and princess of Wales, who greatly improved both the house and gardens; now occupied by his present majesty, who has greatly enlarged the gardens, and formed a junction with them and Richmond gardens. The gardens of Kew are not very large, nor is their situation by any means advantageous, as it is low and commands no prospects. Originally the ground was one continued dead flat; the soil was in general barren, and without either wood or water. With so many disadvantages it was not easy to produce any thing even tolerable in gardening; but princely munificence, guided by a director equally skilled in cultivating the earth and in the politer arts, overcame all difficulties. What was once a desert is now an Eden. In 1758, an act passed for building a bridge across the Thames to Kew-Green; and a bridge was built of eleven arches; the two piers and their dependant arches on each side next the shore, built of brick and stone; the intermediate arches entirely wood; the centre arch 50 feet wide, and the road over the bridge 30. But this bridge is to be taken down as soon as a very elegant one, now erecting close by it (1791), is completed.

KEXHOLM, that part of Finland which borders upon Russia. The lake Ladoga crosses it, and divides it into two parts. By the treaty between Russia and Sweden in 1721, the Swedes were obliged to abandon the best part to the Russians. The country in general is full of lakes and marshes, thinly inhabited, and badly cultivated. The lake above mentioned is 120 miles in length, and full of fish.

KEXHOLM, or *Carelgorod*, a town of Russia, in a territory of the same name, not very large, but well fortified, and has a strong castle. The houses are built with wood. It formerly belonged to the Russians, after which the Swedes had possession of it for a whole century; but it was retaken by the Russians in 1710. Near it is a considerable salmon fishery. It is seated on two islands on the north-west side of the lake Ladoga, in E. Long. 30. 5. N. Lat. 61. 12. Near it is another town called *New Kexholm*.

KEY, an instrument for the opening of locks. See LOCK.

L. Molinus has a treatise of keys, *De clavibus veterum*, printed at Upsal: he derives the Latin name *clavis*, from the Greek *κλειω claudio*, "I shut;" or from the adverb *clam* "privately;" and adds, that the use of keys is yet unknown in some parts of Sweden.

The invention of keys is owing to one Theodore of Samos,

Key.

Samos, according to Pliny and Polydore Virgil: but this must be a mistake, the use of keys having been known before the siege of Troy; mention even seems made of them in the 10th chapter of Genesis.

Molinus is of opinion, that keys at first only served for the untying certain knots, wherewith they anciently secured their doors: but the Laconic keys, he maintains, were nearly akin in use to our own; they consisted of three single teeth, and made the figure of an E; of which form there are still some to be seen in the cabinets of the curious.

There was another key called *βαλλοκρετα*, made in the manner of a male-screw; which had its corresponding female in a bolt assixed to the door. *Key* is hence become a general name for several things serving to shut up or close others. See the article *Lock*.

*Key*, or *Key-stone*, of an *Arch* or *Vault*, is the last stone placed a-top thereof; which being wider and fuller at the top than bottom, wedges, as it were, and binds all the rest. The key is different in the different orders: in the Tuscan and Doric it is a plain stone only projecting; in the Ionic it is cut and waved somewhat after the manner of consoles; in the Corinthian and Composite it is a console enriched with sculpture, foliages, &c.

*Key* is also used for ecclesiastical jurisdiction; particularly for the power of excommunicating and absolving. The Romanists say, the pope has the power of the keys, and can open and shut Paradise as he pleases; grounding their opinion on that expression of Jesus Christ to Peter, "I will give thee the keys of the kingdom of heaven." In St Gregory we read, that it was the custom heretofore for the popes to send a golden key to princes, wherein they inclosed a little of the filings of St Peter's chains kept with a world of devotion at Rome; and that these keys were worn in the bosom, as being supposed to contain some wonderful virtues.

*Key* is also used for an index or explanation of a cipher. See *CIPHER*.

*Keys* of an *Organ*, *Harpsichord*, &c. those little pieces in the fore part of those instruments, by means whereof the jacks play, so as to strike the strings. These are in number 28 or 29. In large organs there are several sets of the keys, some to play the secondary organ, some for the main-body, some for the trumpet, and some for the echoing trumpet, &c.; in some there are but a part that play, and the rest are only for ornament. There are 20 slits in the large keys, which make half-notes. See the article *ORGAN*, &c.

*Key*, in music, a certain fundamental note or tone, to which the whole piece, be it in cantata, sonata, concerto, &c. is accommodated, and with which it usually begins but always ends.

*Key*, or *Quay*, a long wharf, usually built of stone, by the side of a harbour or river, and having several storehouses for the convenience of lading and discharging merchant-ships. It is accordingly furnished with posts and rings, whereby they are secured; together with cranes, capsterns, and other engines, to lift the goods into or out of the vessels which lie along-side.

The verb *cajare*, in old writers, according to Scaliger, signifies to *keep in* or *restrain*; and hence came

our term *key* or *quay*, the ground where they are made being bound in with planks and posts.

*Keys* are also certain sunken rocks lying near the surface of the water, particularly in the West-Indies.

*KEYNSHAM*, a town of Somersetshire, 116 miles from London. It is a great thoroughfare in the lower road between Bath and Bristol. They call it proverbially *smoakly* Keynsham, and with equal reason they might call it *foggy*. It has a fine large church, a stone bridge of 15 arches over the Avon to Gloucestershire, and another over the river Chew. Its chief trade is malting. It has a charity-school, a weekly market, and three fairs.

*KEYSER'S PILLS*, a celebrated mercurial medicine, the method of preparing which was purchased by the French government, and has since been published by M. Richard.

The first, and what, according to Mr Keyser, is the most essential operation, consists in separating the mercury very exactly from all heterogeneous matter, by reducing it to an æthiops. This is effected by means of an hydraulic machine, a plan of which Mr Keyser intended to have given to government before his death: but although he did not live to accomplish his resolution, his family still offer to do it when desired. According to the description given by M. Richard, this machine consists of a number of buckets, in which mercury is triturated with water, till the water acquires a black colour. This water, upon standing, deposits a sediment, which, being dried by a proper heat, is the æthiops required.

The second process consists in revivifying the mercury by distillation, in freeing it from all oily matters, by means of quick-lime, in detaching this quick-lime by repeated washings, and afterwards in drying it by means of a sand heat.

The third operation consists in the reduction of the mercury purified by this process to a red calx, by means of heat. In conducting this operation, Mr Keyser advises, that the mercury be put into glass matrasses, a small quantity only in each. For the proper degree of heat, he directs those who would practise the operation to consult Lemery and other chemists.

The fourth operation is, the dissolution of the calcined mercury, obtained by the former process, in distilled vinegar, by means of triture. A pound of this mercury may be dissolved in eight pints of vinegar, by rubbing it for an hour or two in a mortar, which should be kept solely for that purpose. Care must also be taken that the vinegar be not distilled in a metallic but in a glass vessel.

The fifth process consists in the intimate mixture of this vinegar, impregnated with mercury, with manna. Each pound of the vinegar containing about two ounces of mercury, will require two pounds of manna. They must be rubbed together upon marble stones till they acquire a uniform consistence, which will be liquid to such a degree as to pass through a hair-cloth, for separating the impurities of the manna. After being managed in this manner, it must be spread upon a marble slab, and left to dry there, without the assistance of fire, till it acquires such a consistence as not to

run off upon the table being turned to its side. It must then be placed before the fire, and at the same time moved from one part of the stone to another, by means of a knife, furnished with a large pliant blade. By this means, it is perfectly prepared for forming the pills.

The sixth and last process consists in the formation of the mass thus prepared into pills. These Mr Keyser made to weigh either three grains or a grain and a half; the first for robust, the last for delicate constitutions.

To this account given for the preparation of these pills, Mr Keyser has added some reflections, by way of supplement. He observes, that, by the purification of the mercury from distillation, a great quantity of heterogeneous matter is separated from it. This, however, by no means frees it completely from all foreign matter. And, as mercury purified, upon being calcined and dissolved in vegetable acid, is a much more powerful medicine than mercury calcined without purification, he concludes, that repeated purifications would render it still more active.

Another remark which he gives, respects the dissolution of the mercurius calcinatus in the distilled vinegar. He observes, that the mercury thus dissolved may be made to unite with running mercury, and to form a very singular product. He formerly mentioned, that a pound of this mercurius calcinatus was to be dissolved in eight pints of vinegar. If to this be added two pounds of running mercury, and the agitation continued, a substance will arise to the surface in the form of cream. This being removed by the assistance of a wooden spoon, more will continue to rise as long as the agitation is continued. The cream being dried and incorporated with manna, in the proportion of one part of the cream to eight of manna, forms a very useful purgative, and is said to be an effectual remedy against recent venereal complaints, particularly against chancres.

M. Richard concludes his account of Keyser's pills with observing, that he considers it to be, without exception, the most effectual remedy for the venereal disease hitherto discovered. But before entering upon the detail, he remarks, that it is his opinion the process may be much abridged, without diminishing the efficacy of the medicine. He judged it proper, however, to deliver to the public the method of preparing the pills in Mr Keyser's own words; and he has not afterwards pointed out the improvements he proposes.

KEYSLER (John George), a learned German antiquarian, was born at Thourneau in 1689. After studying at the university of Halle, he was appointed preceptor to Charles Maximilian and Christian Charles, the young counts of Giech Buchau; with whom he travelled through the chief cities of Germany, France, and the Netherlands, gaining great reputation among the learned as he went along, by illustrating several monuments of antiquity, particularly some fragments of Celtic idols lately discovered in the cathedral of Paris. Having acquitted himself of this charge with great honour, he procured in 1716 the education of two grandsons of Baron Bernstorff first minister of state to his Britannic majesty as elector of Brunswick Lunenburg. However, obtaining leave in 1718 to vi-

sit England, he was elected a fellow of the Royal Society for a learned essay *De Dea Nebelennia nomine veterum Walachorum topico*: he gave also an explanation of the ancient monument on Salisbury plain called *Stone-henge*, with A Dissertation on the Consecrated Mistletoe of the Druids. Which detached essays, with others of the same kind, he published on his return to Hanover, under the title of *Antiquitates selecte Septentrionales et Celtae*, &c. He afterwards made the grand tour with the young barons, and to this tour we owe the publication of his travels; which were translated into English, and published in 1756, in 4 vols 4to. Mr Keyser on his return spent the remainder of his life under the patronage of his noble pupils, who committed their fine library and museum to his care, with a handsome income. He died in 1743.

KIAM, a great river of China, which takes its rise near the western frontier, crosses the whole kingdom eastward, and falls into the bay or gulph of Nanking, a little below that city.

KIANG-si, a province of China, bounded on the north by that of Kiang-nan, on the west by Hou-quang, on the south by Quang tong, and on the east by Fo-kien and Tehe kiang. The country is extremely fertile; but it is so populous, that it can scarcely supply the wants of its inhabitants: on this account they are very economical; which exposes them to the sarcasms and raillery of the Chinese of the other provinces: however, they are people of great solidity and acuteness, and have the talent of rising rapidly to the dignities of the state. The mountains are covered with simples; and contain in their bowels mines of gold, silver, lead, iron, and tin: the rice it produces is very delicate, and several barks are loaded with it every year for the court. The porcelain made here is the finest and most valuable of the empire. This province contains 13 cities of the first class, and 78 of the second and third.

KIANG-Nan, a province of China, and one of the most fertile, commercial, and consequently one of the richest, in the empire. It is bounded on the west by the provinces of Ho-nan and Hou quang; on the south by Tehe-kiang and Kiang-si; and on the east by the gulph of Nanking; the rest borders on the province of Chan tong. The emperors long kept their court in this province; but reasons of state having obliged them to move nearer to Tartary, they made choice of Pe-king for the place of their residence. This province is of vast extent; it contains fourteen cities of the first class, and ninety-three of the second and third. These cities are very populous, and there is scarcely one of them which may not be called a place of trade. Large barks can go to them from all parts; because the whole country is intersected by lakes, rivers, and canals, which have a communication with the great river Yang-tse kiang, which runs through the middle of the province. Silk-stuffs, lacquer-ware, ink, paper, and in general every thing that comes from Nanking, as well as from the other cities of the province, are much more esteemed, and fetch a higher price than those brought from the neighbouring provinces. In the village of Chang-hai alone, and the villages dependent on it, there are reckoned to be more than 200,000 weavers of common cotton cloths. The manufacturing of these cloths gives employment to the greater part of the

minster.

the women.—In several places on the sea coast there are found many salt-pits, the salt of which is distributed all over the empire. In short this province is so abundant and opulent, that it brings every year into the emperor's treasury about 32,000,000 taels (or ounces of silver), exclusive of the duties upon every thing exported or imported. The people of this country are civil and ingenious, and acquire the sciences with great facility: hence many of them become eminent in literature, and rise to offices of importance by their abilities alone. This province is divided into two parts, each of which has a distinct governor. The governor of the eastern part resides at Sou-tcheou-fou, that of the western at Ngan-king-fou. Each of these governors has under his jurisdiction seven *fou* or cities of the first class.

**KIBURG**, a town of the canton of Zurich in Switzerland, with a castle; seated on the river Theoff, in E. Long. 8. 50 N. Lat. 47. 20.

**KID**, in zoology, the name by which young goats are called. See **GOAT**.

**KIDDER** (Dr Richard), a learned English bishop, was born in Suffex, and bred at Cambridge. In 1689, he was installed dean of Peterborough; and in 1691, was nominated to the bishopric of Bath and Wells, in the room of Dr Thomas Ken, who had been deprived for not taking the oaths to king William and queen Mary. He published, 1. The young man's duty. 2. A demonstration of the Messiah, 3 vols 8vo. 3. A commentary on the five books of Moses, 2 vols 8vo; and several other pious and valuable tracts. He was killed with his lady in his bed by the fall of a stack of chimneys, at his house in Wells, during the great storm in 1703. The bishop, in the dissertation prefixed to his commentary on the five books of Moses, having reflected upon Monsieur Le Clerc, some letters passed between them in Latin, which are published by Le Clerc in his *Bibliothèque Choisie*.

**KIDDERMINSTER**, or **KEDDERMINSTER**, a town of Worcestershire, seated under a hill on the river Stour, not far from the Severn, 128 miles from London. It is a large town of 1180 houses, with about 6000 inhabitants, who carry on an extensive trade in weaving in various branches. In 1735, a carpet manufactory was established with success, so as to employ in 1772 above 250 looms; and there are upwards of 700 looms employed in the silk and worsted. Above 1600 hands are employed as spinners, &c. in the carpet looms only in the town and neighbourhood; upwards of 1400 are employed in preparing yarn, which is used in different parts of England in carpeting; and it is supposed not less than 2000 are employed in the silk and worsted looms in the town and neighbourhood. The silk manufactory was established in 1755. The town is remarkably healthy, and has also an extensive manufactory of quilting in the loom in imitation of Marseilles quilting. Here is a Presbyterian meeting house; and they have a handsome church, two good free-schools, a charity school, and two alms-houses, &c. The town is governed by a bailiff, 12 capital burgeses, 25 common councilmen, &c. who have a town-hall. It formerly sent members to parliament. By the late inland navigation, it has communication by the junction of the Severn canal with the rivers Mersey, Dee, Ribble, Ouse, Trent, Darwent, Severn, Humber, Thames,

Avon, &c. which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, York, Lancaster, Westmoreland, Chester, Stafford, Warwick, Leicester, Oxford, Worcester, &c. This parish extends to Bewdley-bridge, has a weekly market, and three fairs. W. Long. 2. 15. N. Lat. 52. 28.

**KIDDERS**, those that badge or carry corn, dead victuals, or other merchandise, up and down to sell: every person being a common badger, kiddier, lader, or carrier, &c. says the stat. 5 Eliz. cap. 12. And they are called *kiddiers*, 13 Eliz. cap. 25.

**KIDDLE**, or **KIDEL**, (*Kidellus*), a dam or wear in a river with a narrow cut in it, for the laying of pots or other engines to catch fish.

The word is ancient; for in Magna Charta, cap. 24. we read, *Omnes kidelli deponantur per Thamesiam & Medwayam, & per totam Angliam, nisi per coseram maris*. And by king John's charter, power was granted to the city of London, *de kidellis amovendis per Thamesiam & Medwayam*. A survey was ordered to be made of the wears, mills, flanks, and kidells, in the great rivers of England, 1 Hen. IV. Fishermen of late corruptly call these dams *kettles*; and they are much used in Wales and on the sea coasts of Kent.

**KIDDINGTON**, a town of Oxfordshire, four miles from Woodstock, and 12 from Oxford. It is situated on the Glym river, which divides the parish in two parts, viz. Over and Nether Kiddington, in the latter of which stands the church. This parish was given by King Otha in 780 to Worcester priory. Here King Ethelred had a palace; in the garden of the manor-house is an antique font brought from Edward the Confessor's chapel at Islip, wherein he received baptism. In Hill wood near this place is a Roman encampment in extraordinary preservation, but little noticed.

**KIDNAPPING**, the forcible abduction or stealing away of man, woman, or child, from their own country, and sending them into another. This crime was capital by the Jewish law: "He that stealeth a man and selleth him, or if he be found in his hand, shall surely be put to death". So likewise in the civil law, the offence of spiriting away and stealing men and children, which was called *plagium*, and the offenders *plagiarii*, was punished with death. This is unquestionably a very heinous crime, as it robs the king of his subjects, banishes a man from his country, and may in its consequences be productive of the most cruel and disagreeable hardships; and therefore the common law of England has punished it with fine, imprisonment, and pillory. And also the statute 11 and 12 W. III. c. 7. though principally intended against pirates, has a clause that extends to prevent the leaving of such persons abroad as are thus kidnapped or spirited away; by enacting, that if any captain of a merchant-vessel shall (during his being abroad) force any person on shore, or wilfully leave him behind, or refuse to bring home all such men as he carried out, if able and desirous to return, he shall suffer three months imprisonment.

**KIDNEYS**, in anatomy. See there, n<sup>o</sup> 101.

*KIDDER-Bean*. See **PHASEOLUS**.

**KIDEL**, a city of Germany, in the duchy of Holstein, in the circle of Lower Saxony, and the residence

Kiel.

† Exod. 16.

**KIGGELARIA**, in botany : A genus of the dicandra order, belonging to the dicæcia class of plants; and in the natural method ranking under the 37th order, *Columnifera*. The male calyx is quinquepartite; the corolla pentapetalous; there are five trilobous glandules; the antheræ are perforated at top: the female calyx and corolla as in the male; there are five styles; the capsule unilocular, quinquevalved, and polyspermous. There is but one species, viz. the *Africana*. It hath an upright woody stem, and purplish branches, growing 15 or 18 feet high; oblong, sawed, alternate leaves; and diceious, greenish-white flowers, in clusters from the sides of the branches; succeeded by globular rough fruit, the size of cherries, containing the seeds, which seldom ripen here. As this is a native of warm climates, it must be constantly kept in a stove in this country. It is propagated by seeds, layers, or cuttings, though most readily by seed.

**KIGHLEY**, a town in the west riding of Yorkshire, six miles to the south-east of Skipton in Craven. It stands in a valley surrounded with hills at the meeting of two brooks, which fall into the river Aire one mile below it. Every family is supplied with water brought to or near their doors in stone troughs from a never-failing spring on the west side of it. The parish is six miles long and two broad, and is 60 miles from the east and west seas; yet at the west end of it near Camel-Cross is a rising ground, from which the springs on the east side of it run to the east sea, and those on the west to the west sea. By the late inland navigation, this town has a communication with the rivers Mersey, Dee, Ribble, Ouse, Trent, Darwent, Severn, Humber, Thames, Avon, &c. which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, Lancaster, Westmoreland, Chester, Stafford, Warwick, Leicester, Oxford, Worcester, &c.

**KILARNEY**. See **KILLARNEY**.

**KILBEGGAN**, a post, fair, and borough town of Ireland, in the county of Westmeath and province of Leinster, 44 miles from Dublin. It returns two members to parliament; patronage in the Lambert family. It is seated on the river Brosna, over which there is a bridge. There was here a monastery founded in 1200, and dedicated to the Virg. in Mary, and inhabited by monks from the Cistercian abbey of Melefont. The fairs are two.

**KILDA** (S), one of the Hebrides or western islands of Scotland. It lies in the Atlantic ocean, about 58. 30. N. Lat.; and is about three English miles in length from east to west, and its breadth from south to north not less than two. The ground of St Kilda, like much the greatest part of that over all the Highlands, is much better calculated for pasture than tillage.—Restrained by idleness, a fault or vice much more pardonable here than in any other part of Great Britain, or discouraged by the form of government under which they live, the people of the island study to rear up sheep, and to kill wild-fowl, much more

than to engage deeply in the more toilsome business of husbandry.—All the ground hitherto cultivated in this island lies round the village. The soil is thin, full of gravel, and of consequence very sharp. This, tho' naturally poor, is, however, rendered extremely fertile, by the singular industry of very judicious husbandmen: these prepare and manure every inch of their ground, so as to convert it into a kind of garden. All the instruments of agriculture they use, or indeed require, according to their system, are a spade, a mall, and a rake or harrow. After turning up the ground with a spade, they rake or harrow it very carefully, removing every small stone, every noxious root or growing weed that falls in their way, and pound down every stiff clod into dust. It is certain that a small number of acres well prepared in St Kilda, in this manner, will yield more profit to the husbandman than a much greater number when roughly handled in a hurry, as is the case in the other western isles. The people of St Kilda sow and reap much earlier than any of their neighbours on the western coast of Scotland. The heat of the sun, reflected from the hills and rocks into a low valley facing the south-east, most in the summer time be quite intense; and however rainy the climate is, the corn must for these reasons grow very fast and ripen early.

The harvest is commonly over at this place before the beginning of September; and should it fall out otherwise, the whole crop would be almost destroyed by the equinoctial storms. All the islanders on the western coast have great reason to dread the fury of autumnal tempests: these, together with the excessive quantities of rain they have generally throughout seven or eight months of the year, are undoubtedly the most disadvantageous and unhappy circumstances of their lives.

Barley and oats are the only sorts of grain known at St Kilda; nor does it seem calculated for any other. Fifty bolls of the former, old Highland measure, are every year brought from thence to Harris; and all the western islands hardly produce any thing so good of the kind. Potatoes have been introduced among that people only of late, and hitherto they have raised but small quantities of them. The only appearance of a garden in this whole land, so the natives call their principal island in their own language, is no more than a very inconsiderable piece of ground, which is inclosed and planted with some cabbages. On the east side of the island, at the distance of a quarter of a mile from the bay, lies the village, where the whole body of this little people (the number amounting in 1764 to no more than 88) live together like the inhabitants of a town or city. It is certain that the inhabitants were much more numerous formerly than at present; and the island, if under proper regulations, might easily support 300 souls. Martin, who visited it about the end of the last century, found 180 persons there; but about the year 1730, one of the people coming to the island of Harris, was seized with the small-pox and died. Unluckily his clothes were carried away by one of his relations next year; and thus was the infection communicated, which made such havoc, that only four grown persons were left alive. Their houses are built in two rows, regular, and facing one another; with a tolerable causeway in the middle, which

they call the *street*. These habitations are made and contrived in a very uncommon manner. Every one of them is flat in the roof, or nearly so, much like the houses of some oriental nations. That from any one of these the St Kildians have borrowed their manner of building, no man of sense will entertain a suspicion. They have been taught this lesson by their own reason, improved by experience. The place in which their lot has fallen is peculiarly subject to violent squalls and furious hurricanes: were their houses raised higher than at present, they believe the first winter-storm would bring them down about their ears. For this reason the precaution they take in giving them roofs much flatter than ordinary seems to be not altogether unnecessary. The walls of these habitations are made of a rough gritty kind of stones, huddled up together in haste, without either lime or mortar, from eight to nine feet high. In the heart of the walls are the beds, which are overlaid with flags, and large enough to contain three persons. In the side of every bed is an opening, by way of door, which is much too narrow and low to answer that purpose. All their dwelling-houses are divided into two apartments by partition-walls. In the division next the door, which is much the largest, they have their cattle stalled during the whole winter-season; the other serves for kitchen, hall, and bed room.

It will be readily expected, that a race of men and women bred in St Kilda must be a very slovenly generation, and every way inelegant. It is indeed impossible to defend them from this imputation. Their method of preparing a sort of manure, to them indeed of vast use, proves that they are very indelicate. After having burnt a considerable quantity of dried turf, they spread the ashes with the nicest care over the floor of that apartment in which they eat and sleep. These ashes, so exactly laid out, they cover with a rich friable sort of earth; over this bed of earth they scatter a proportionable heap of that dust into which peats are apt to crumble away: this done, they water, tread, and beat the whole compost into a hard floor, on which they immediately make new fires very large, and never extinguished till they have a sufficient stock of new ashes on hand. The same operations are repeated with a never-failing punctuality, till they are just ready to sow their barley; by that time the walls of their houses are sunk down, or, to speak more properly, the floors risen about four or five feet.

To have room enough for accumulating heaps of this compost one above another, the ancient St Kildians had ingenuity enough to contrive their beds within the linings of their walls; and it was for the same reason they took care to raise these walls to an height far from being common in the other western islands. The manure produced in this way must undoubtedly be good; though probably rather sharp than of long duration, as it is scattered in small quantities upon the surface of the ground. Be that as it will, those who practice this art are abundantly lavish in its praises. They call it a *commodity inestimably precious*; and one may venture to affirm, that a genuine St Kildian would scruple to barter it away for all the diamonds in Brazil and Golconda.

It is certain that cleanliness must contribute greatly

to health, and of course longevity; but in spite of that instance of indecacy now given, and many more which might have been added, the people of this island are not more short-lived than other-men. Their total want of those articles of luxury, which have so natural a tendency to destroy the constitution of the human body, and their moderate exercises, will, together with some other circumstances, keep the balance of life equal enough between them and those who are absolute strangers to slovenliness.

Besides the dwelling-houses already described, there are a prodigious number of little cells dispersed over all the island; which consist entirely of stones, without any the smallest help of timber. These cells are from 12 to 18 feet in length, and a little more than seven in height. Their breadth at the foundation is nearly equal to the height. Every stone hangs above that immediately below, not perpendicularly, but inclines forward, so as to be nearer the opposite side of the grotto, and thus by imperceptible degrees till the two highest courses are near enough to be covered by a single flag at the top. To hinder the rain from falling down between the interstices above, the upper part of the building is overlaid with turf, which looks like a fine green sward while new. The inhabitants secure their peats, eggs, and wild-fowl, within these small repositories: every St Kildian has his share of them, in proportion to the extent of land he possesses, or the rent he pays to the steward. From the construction of these cells, and the toil they must have cost before they could have been finished, it seems plain, that those who put them together, were, if not more ingenious than their neighbours in the adjacent islands, at least more industrious than their own successors.

The St Kilda method of catching wild-fowl is very entertaining. The men are divided into fowling-parties, each of which consists generally of four persons distinguished by their agility and skill. Each party must have at least one rope about 30 fathoms long; this rope is made out of a strong raw cow hide, salted for that very purpose, and cut circularly into three thongs all of equal length; these thongs being closely twisted together, form a three-fold cord, able to sustain a great weight, and durable enough to last for about two generations: to prevent the injuries it would otherwise receive from the sharp edges of the rocks, against which they must frequently strike, the cord is lined with sheep-skins, dressed in much the same manner.

This rope is a piece of furniture indispensably necessary, and the most valuable implement a man of substance can be possessed of in St Kilda. In the testament of a father, it makes the very first article in favour of his eldest son: should it happen to fall to a daughter's share, in default of male heirs, it is reckoned equal in value to the two best cows in the island.

By the help of such ropes, the people of the greatest prowess and experience here traverse and examine rocks prodigiously high. Linked together in couples, each having either end of the cord fastened about his waist, they go frequently through the most dreadful precipices: when one of the two descends, his colleague plants himself on a strong shelf, and takes care

re. to have such sure footing there, that if his fellow-adventurer makes a false step, and tumbles over, he may be able to save him.

The following anecdote of a steward of St Kilda's deputy will give the reader a specimen of the dangers they undergo, and at the same time of the uncommon strength of the St Kildians. This man, observing his colleague lose his hold, and tumbling down from above, placed himself so firmly upon the shelf where he stood, that he sustained the weight of his friend, after falling the whole length of the rope. Undoubtedly these are stupendous adventures, and equal to any thing in the feats of chivalry. Mr Macaulay gives an instance of the dexterity of the inhabitants of St Kilda in catching wild-fowl, to which he was an eye-witness. Two noted heroes were drawn out from among all the ablest men of the community: one of them fixed himself on a craggy shelf; his companion went down 60 fathoms below him; and after having darted himself away from the face of a most alarming precipice hanging over the ocean, he began to play his gambols; he sung merrily, and laughed very heartily: after having performed several antic tricks, and given all the entertainment his art could afford, he returned in triumph, and full of his own merit, with a large string of fowls about his neck, and a number of eggs in his bosom. This method of fowling resembles that of the Norwegians, as described by bishop Pontoppidan.

**KILDARE**, a town of Ireland, and capital of a county of the same name, is situated 28 miles south-west of Dublin. It returns two members to parliament, patron the duke of Leinster; and is governed by a sovereign, recorder, and two portreeves. The church of Kildare was very early erected into a cathedral with episcopal jurisdiction, which dignity it retains to this day; the cathedral, however, has been for several years neglected, and at present is almost in ruins. St Brigid founded a nunnery at Kildare, which afterwards came into the possession of the regular canons of St Augustin: this saint died 1st February 523, and was interred here; but her remains were afterwards removed to the cathedral church of Down. In the year 638, *Aod Dubh* or *Black Hugh* king of Leinster abdicated his throne, and took on him the Augustinian habit in this abbey; he was afterwards chosen abbot and bishop of Kildare, and died on the 10th May. In 756, Eiglitigio the abbot, who was also bishop of Kildare, was killed by a priest as he was celebrating mass at the altar of St Brigid; since which time no priest whatsoever was allowed to celebrate mass in that church in the presence of a bishop. In 1220 Henry de Loundres archbishop of Dublin put out the fire called *inextinguishable*, which had been preserved from a very early time by the nuns of St Brigid. This fire was however relighted, and continued to burn till the total suppression of monasteries. Here was also a Grey abbey on the south side of the town, erected for friars of the Franciscan order, or, as they were more generally called, *Grey friars*, in the year 1260, by Lord William de Vesey; but the building was completed by Gerald Fitzmaurice, Lord Offaley. A considerable part of this building yet remains, which appears not to have been of very great extent. A house for white friars was likewise founded in this town by William de

Vesey in 1290; the round tower here is 130 feet high, built of white granite to about 12 feet above the ground, and the rest of common blue stone. The pedestal of an old cross is still to be seen here; and the upper part of a cross lies near it on the ground.—Fairs are held here on 12th February, Easter-Tuesday, 12th May, and 19th September. The fairs held here are four.

**KILDARE**, a county of Ireland, in the province of Leinster, which is 37 miles in length and 20 in breadth; and is bounded on the east by Dublin and Wicklow, on the west by King and Queen's county, on the north by East-Meath, and on the south by Catherlogh. It is a fine arable country, well watered by the Barrow, Liffey, and other rivers, and well inhabited and cultivated, containing 228,590 Irish plantation acres, 100 parishes, 10 baronies, 4 boroughs, and returns 10 members to parliament. The chief town is of the same name, and gave title of earl to the noble family of Fitzgerald. It was anciently called *Chilledair*, i. e. "the wood of oaks," from a large forest which comprehended the middle part of this county; in the centre of this wood was a large plain, sacred to heathen superstition, and at present called the *Curragh of Kildare*; at the extremity of this plain, about the commencement of the 6th century, St Brigid, one of the heathen vestals, on her conversion to the Christian faith, founded, with the assistance of St Conlath, a church and monastery, near which, after the manner of the Pagans, St Brigid kept the sacred fire in a cell, the ruins of which are still visible.

**KILDERKIN**, a liquid measure, containing two firkins.

**KILIAN** (Lucas), an eminent engraver, was a native of Augsburg in Germany, and flourished at the beginning of the 17th century. In what school he learned the art is uncertain; but his style of engraving bears no small resemblance in many particulars to that of Henry Goltzius, and of John Muller his disciple. It appears, however, that he went to Italy in order to complete his studies, where he engraved several plates from the pictures of the great Italian masters. According to Mr Strutt, few artists have manifested a greater command of the graver than Kilian, whether we consider the facility with which the strokes are turned upon each other, or the firmness with which they are executed; and one cannot help admiring it, though it evidently strikes us, that by paying too close attention to this part of the art, he neglected the correctness of his outlines, and fatigued the lights with unnecessary work; by which means he broke the masses, and often totally destroyed the effect of his prints. The naked parts of the human figure are seldom well expressed; the extremities especially are in general very heavy, and sometimes incorrect. Upon the works of this master, however, it appears, that Balechou, so famous for his skill in handling of the graver, formed his taste. His works are exceedingly numerous. The time of his death is not any where mentioned.—There were several other engravers of the same name and family; but of too inferior merit to deserve particular notice.

**KILIANUS** (Cornelius), a native of Brabant, distinguished himself as an excellent corrector of the press at the printing-house of Plantin for 50 years.

Kildare  
Kilianus.

Kilkenny

He likewise wrote several books which are esteemed. His Apology for Correctors against Authors, an epigram of 18 verses, is a proof of his abilities in Latin poetry.

KILKENNY, a county of Ireland, in the province of Leinster, bounded on the south by the county of Waterford, on the north by the Queen's county, on the west by the county of Tipperary, on the east by the counties of Wexford and Catherlogh, and on the north-west by Upper Ossory. The greatest length of this county from north to south is 38 miles, the breadth from east to west 18; and it contains 10 baronies. It is one of the most healthful, pleasant, and populous counties of Ireland. It contains 287,650 Irish plantation acres, 96 parishes, 9 baronies, and 7 boroughs, and returns 16 members to parliament. Gilbert Clare, Earl of Gloucester and Hereford, marrying Isabella, one of the daughters and co-heiresses of William earl Marshal, received as her dower the county of Kilkenny.

KILKENNY, the capital of a county of the same name in Ireland, situated in the province of Leinster, 57 miles south west of Dublin. It takes its name from the cell or church of Canic, who was an eminent hermit in this country; and is one of the most elegant cities in the kingdom. It is the seat of the bishop of Ossory, which was translated from Agabo in Ossory, about the end of Henry II.'s reign, by bishop O'Du-lany. The city is pleasantly situated on the Neor, a navigable river that discharges itself into the harbour of Waterford. It is said of Kilkenny, that its air is without fog, its water without mud, its fire without smoke, and its streets paved with marble. The two latter are indeed matter of fact; for they have in the neighbourhood a kind of coal that burns from first to last without smoke, and pretty much resembles the Welsh coal. Most of the streets also are actually paved with a very good sort of black marble; of which they have large quarries near the town, which takes a fine polish, and is beautifully intermixed with white granite. The air too is good and healthy, though not remarkably clearer than in many other parts of the kingdom. The city is governed by a mayor, recorder, aldermen, and sheriffs. It comprises two towns, viz. Kilkenny so called, and high-town, each of which sends two members to parliament, and both together are computed to contain about 20,000 inhabitants. This city was once of great consequence, as may be seen by the venerable ruins yet remaining of churches, monasteries, and abbeys, which even now in their dilapidated state exhibit such specimens of exquisite taste in architecture as may vie with any modern improvements; and the remains of its gates, towers, and walls, show it to have been a place of great strength. Here too at different times parliaments were held, in which some remarkable statutes were passed. It has two churches, and several catholic chapels; barracks for a troop of horse and four companies of foot; a market is held twice in the week, and there are seven fairs in the year.—Irish town is more properly called the borough of *St Canice*, vulgarly *Kenny*; the patronage of which is in the bishop of Ossory. The cathedral, which stands in a sequestered situation, is a venerable Gothic pile, built above 500 years; and close to it is one of those remarkable round

towers which have so much engaged the attention of travellers. The bishop's palace is a handsome building, and communicates by a covered passage with the church. The castle was first built in 1195, on the site of one destroyed by the Irish in 1173. The situation in a military view was most eligible: the ground was originally a conoid, the elliptical side abrupt and precipitous, with the river running rapidly at its base: here the natural rampart was faced with a wall of solid masonry 40 feet high; the other parts were defended by bastions, curtains, towers, and outworks; and on the summit the castle was erected. This place, as it now stands, was built by the ancestors of the dukes of Ormond: here the Ormond family resided; and it is now in the possession of Mr Butler, a descendant of that illustrious race. The college originally founded by the Ormond family is rebuilt in a style of elegance and convenience. The school and market house are both good buildings; and over the latter is a suite of rooms, in which, during the winter and at races and assizes times, assemblies are held. There are two very fine bridges of cut marble over the Neor; John's Bridge particularly is light and elegant. The Ormond family built and endowed a free school in this city. Here are the ruins of three old monasteries, called *St John's*, *St Francis's*, and the *Black abbey*: belonging to the latter are the remains of several old monuments, almost buried in the ruins; and the courts of the others are converted into barracks. The manufactures chiefly carried on here are, coarse woollen cloths, blankets of extraordinary fine quality, and considerable quantities of starch. In the neighbourhood also are made very beautiful chimney-pieces of that species of stone already mentioned, called *Kilkenny marble*: they are cut and polished by water, a mill for that purpose (the only one of its kind perhaps in Europe) being invented by the late Mr Colles. The Kilkenny coal-pits are within nine miles of the town. This city came by marriage into the ancient family of Le Despencer. It was incorporated by charter from King James I. in 1609. The market-cross of Kilkenny continued an ornament to the city until 1771, when it was taken down; the date on it was MCCC. Sir James Ware mentions Bishop Cantwell's rebuilding the great bridge of Kilkenny, thrown down by an inundation about the year 1447. It appears also that St John's bridge fell down by a great flood in 1564; and on 2d October 1763, by another like circumstance, Green's bridge near the cathedral fell.—The borough of St Canice, or Irish-town, always enjoyed very ancient prescriptive rights. A close roll of 5 Edward III. A. D. 1376, forbids the magistrates of Kilkenny to obstruct the sale of victuals in the market of Irish-town, or within the cross, under the pretence of custom for murage: and lest the ample grants made to Kilkenny might be interpreted so as to include Irish-town, the corporation of the latter secured their ancient rights by letters-patent 15 Edward IV. A. D. 1474. These renew their former privileges, and appoint a portrieve to be chosen every 21st September, and sworn into office on the 11th October. The portrieve's prison was at Troy-gate. Whenever the mayor of Kilkenny came within Water-gate, he dropt down the point of the city-sword, to show he claimed no pre-eminence within the borough.

KILLALOE,

**KILLALOE**, a bishop's see in the county of Clare and province of Munster, in Ireland, 86 miles from Dublin, otherwise *Lounia*. It was anciently written *Kill-da-Lua*, i. e. "the church of Lua." from *Lua*, or *Molua*, who about the beginning of the 6th century founded an abbey near this place. St Molua appears to have derived his name from *Lounia*, the place of his residence, as was customary amongst the ancient Irish. On the death of St Molua, St Flannan his disciple, and son of the chief of the district, was consecrated bishop of this place at Rome about the year 639, and the church endowed with considerable estates by his father Theodorick. Towards the close of the 12th century, the ancient see of Roscrea was united to that of Killaloe; from which period these united bishoprics have been governed by the same bishops. At Killaloe is a bridge over the Shannon of 19 arches; and here is a considerable salmon and eel fishery. There are many ancient buildings in and about this town. The cathedral is a Gothic edifice in form of a cross, with the steeple in the centre, supported by four arches; it was built by Donald king of Limerick in 1160. There is a building near it, once the oratory of St Molua; and there is another of the same kind in an island on the Shannon, having marks of still higher antiquity. The see house of the bishop is at Clarisford, near to Killaloe. Adjoining to the cathedral are yet some remains of the mausoleum of Brien Boru.

**KILLARNEY**, a post-town of Ireland in the county of Kerry and province of Munster, seated near a fine lake called *Lough Lean*, or Lake of Killarney. It is distant 143 miles from Dublin, and has two fairs. Within a mile and a half of this place are the ruins of the cathedral of Aghadoe, an ancient bishoprick united to Ardferit; and within four miles the ruins of Aglish church. At this town is the seat and gardens of lord Kenmore.

The beautiful lake of Killarney is divided properly into three parts, called the *lower*, *middle*, and *upper* lake. The northern or lower lake is six miles in length and from three to four in breadth, and the town is situated on its northern shore. The country on this and the eastern boundary is rather of a tame character; but is here and there diversified with gentle swells, many of which afford delightful prospects of the lake, the islands, and surrounding scenery. The southern shore is composed of immense mountains, rising abruptly from the water, and covered with woods of the finest timber. From the centre of the lake the view of this range is astonishingly sublime, presenting to the eye an extent of forest six miles in length, and from half a mile to a mile and a half in breadth, hanging in a robe of rich luxuriance on the sides of two mountains, whose bare tops rising above the whole form a perfect contrast to the verdure of the lower region. On the side of one of these mountains is O'Sullivan's cascade, which falls into the lake with a roar that strikes the timid with awe on approaching it. The view of this sheet of water is uncommonly fine, appearing as if it were descending from an arch of wood, which overhangs it about 70 feet in height from the point of view. Coasting along this shore affords an almost endless entertainment, every change of position presenting a new scene; the rocks hollowed and worn into a va-

riety of forms by the waves, and the trees and shrubs buriling from the pores of the sapless stone, forced to assume the most uncouth shapes to adapt themselves to their fantastic situations. The islands are not so numerous in this as in the upper lake; but there is one of uncommon beauty, viz. Innisfallen, nearly opposite to O'Sullivan's cascade: It contains 18 Irish acres. The coast is formed into a variety of bays and promontories, skirted and crowned with arbutus, holly, and other shrubs and trees; the interior parts are diversified with hills, and dales, and gentle declivities, on which every tree and shrub appears to advantage: the soil is rich even to exuberance; and trees of the largest size incline across the vales, forming natural arches, with ivy entwining in the branches, and hanging in festoons of foliage. The promontory of Mucruis, which divides the upper from the lower lake, is a perfect land of enchantment; there is a road carried through the centre of the promontory, which unfolds all the interior beauties of the place. Amongst the distant mountains, Turk appears an object of magnificence; and Mangerton's loftier, though less interesting summit, rears itself above the whole. The passage to the upper lake is round the extremity of Mucruis, which confines it on one side, and the approaching mountains on the other. Here is the celebrated rock called the *eagle's nest*, which produces wonderful echoes. A French horn founded here, raises a concert superior to 100 instruments; and the report of a single cannon is answered by a succession of peals resembling the loudest thunder, which seems to travel the surrounding scenery, and die away among the distant mountains. The upper lake is four miles in length, and from two to three in breadth; and is almost surrounded by mountains, from which descend a number of beautiful cascades. The islands in this lake are numerous, and afford an amazing variety of picturesque views.—The centre lake, which communicates with the upper, is but small in comparison with the other two, and cannot boast of equal variety. The shores, however, are in many places indented with beautiful bays, surrounded with dark groves of trees, some of which have a most picturesque appearance when viewed from the water. The eastern boundary is formed by the base of Mangerton, down the steep side of which descends a cascade visible for 150 yards: this fall of water is supplied by a circular lake near the summit of the mountain, called the *Devil's Punch Bowl*; which, on account of its immense depth, and the continual overflow of water, is considered as one of the greatest curiosities in Killarney.—Mr Smith seems to think, that one of the best prospects this admired lake affords, is from a rising ground near the ruined cathedral of Aghadoe.

The lake of Killarney is otherwise called *Lough Lane*, or *Loch Lean*, from its being surrounded by high mountains. Nennius says, that these lakes were encompassed by four circles of mines; the first of tin, the second of lead, the third of iron, and the fourth of copper. In the several mountains adjacent to the lakes are still to be seen the vestiges of the ancient mines of iron, lead, and copper; but tin has not as yet been discovered here. Silver and gold are said by the Irish antiquaries to have been found in the early ages: but this is somewhat doubtful, especially in any considerable quantity, though some silver probably was

Killas,  
Killicran-  
kie.

extracted from the lead ore, and small quantities of gold might have been obtained from the yellow copper ore of Mucrus. However, in the neighbourhood of these lakes were found in the early ages, as well as at present, pebbles of several colours, which taking a beautiful polish, the ancient Irish wore in their ears, girdles, and different articles of their dress and furniture.

**KILLAS**, a genus of stones belonging to the argillaceous class, found chiefly in Cornwall in England. Its texture is either lamellar or coarsely granular; the specific gravity from 2630 to 2666. It contains 60 parts of siliceous earth, 25 of argillaceous, 9 of magnetite, and 6 of iron. The greenish kind contains more iron, and gives a green tincture to the nitrous acid.

**KILLICRANKIE**, a noted pass of Perthshire in Scotland. It is formed by the lofty mountains impending over the water of Garrie, which rushes through in a deep, darksome, and horrid channel, beneath. In the last century this was a pass of much danger and difficulty; a path hanging over a tremendous precipice threatened destruction to the least false step of the traveller: at present a fine road formed by the soldiery lent by government, and encouraged by an additional 6d. per day, gives an easy access to the remote Highlands; and the two sides are joined by a fine arch.

Near the north end of this pass, in its open and unimproved state, was fought in the year 1689 the battle of Killicranky, between the adherents of James II. under Viscount Dundee, and of William III. under General Mackay. Dundee's army was very much inferior to that of Mackay's. When he came in sight of the latter, he found them formed in eight battalions ready for action. They consisted of 4500 foot, and two troops of horse. The Highlanders under Dundee amounted to little more than half that number. These he ranged instantly in order of battle. Maclean, with his tribe, formed the right wing. The Macdonalds of Sky, under their chieftain's eldest son, formed the left. The Camerons, the Macdonald's of Glengary, the followers of Clanronald, and a few Irish auxiliaries, were in the centre. A troop of horse were placed behind under Sir William Wallace. The officers sent by James from Ireland were distributed through all the line. His whole army stood in sight of the enemy for several hours on the steep side of a hill, which faced the narrow plain where Mackay had formed his line. Dundee wished for the approach of night; a season suited for either victory or flight.

At five of the clock in the afternoon, a kind of slight skirmish began between the right wing of the Highlanders and the left of the enemy. But neither army wishing to change their ground, the firing was discontinued for three hours. Dundee in the mean time flew from tribe to tribe, and animated them to action. At eight of the clock he gave the signal for battle, and charged the enemy in person at the head of the horse. The Highlanders in deep columns rushed suddenly down the hill. They kept their shot till they were within a pike's length of the enemy; and having fired their muskets, fell upon them sword in hand. Mackay's left wing could not for a moment sustain the shock. They were driven by the Macleans with great

slaughter from the field. The Macdonalds on the left of the Highlanders were not equally successful. Colonel Hastings' regiment of foot stood their ground. They even forced the Macdonald's to retreat. Maclean, with a few of his tribe, and Sir Evan Cameron at the head of his clan, fell suddenly on the flank of this gallant regiment, and forced them to give way. The slaughter ended not with the battle. Two thousand fell in the field and the flight. The tents, baggage, artillery, and provisions of the enemy, and even king William's Dutch standard, which was carried by Mackay's regiment, fell into the hands of the Highlanders. The victory was now complete. But the Highlanders lost their gallant leader. Perceiving the unexpected resistance of Colonel Hastings' regiment, and the confusion of the Macdonald's, Dundee rode rapidly to the left wing. As he was raising his arm, and pointing to the Cameron's to advance, he received a ball in his side. The wound proved mortal; and with Dundee fell all the hopes of king James at that time.

**KILLIGREW** (William), eldest son of Sir Robert Killigrew knight, was born in 1605. He was gentleman-usher of the privy-chamber to king Charles I. and on the restoration to Charles II. When the latter married the princess Catharine of Portugal, he was created vice-chamberlain; in which station he continued 22 years, and died in 1693. He was the author of four plays, which, though now thrown aside, were much applauded by the poets of that time, particularly by Mr Waller; and in the decline of life he published some pious reflections on the instability of human happiness, when our views are not directed to a future state.

**KILLIGREW** (Thomas), brother of the former, was born in 1611; and in process of time distinguished himself by his uncommon natural parts. He was page of honour to King Charles I. and groom of the bed-chamber to Charles II. with whom he suffered many years exile; during which he applied his leisure hours to the study of poetry, and to the composition of several plays. After the restoration he continued in high favour with the king, and had frequently access to him when he was denied to the first peers in the realm; and being a man of great wit and liveliness of parts, and having from his long intimacy with that monarch, and being continually about his person during his troubles, acquired a freedom and familiarity with him, which even the pomp of majesty afterwards could not check in him, he sometimes, by way of jest, which King Charles was ever fond of, if genuine, even though himself was the object of the satire, would adventure bold truths which scarcely any one besides would have dared even to hint at. One story in particular is related of him, which if true is a strong proof of the great lengths he would sometimes proceed in his freedoms of this kind, which is as follows:—When the king's unbounded passion for women had given his mistress such an ascendancy over him, that, like the effeminate Persian monarch, he was much fitter to have handled a distaff than to wield a sceptre, and for the conversation of his concubines utterly neglected the most important affairs of state, Mr Killigrew went to pay his majesty a visit in his private apartments, habited like a pilgrim who was bent on a long journey.

The.

grew, immediately asked him what was the meaning of it, and whither he was going? "To hell," bluntly replied the wag. "Prithee (said the king), what can your errand be to that place?" "To fetch back Oliver Cromwell (rejoined he), that he may take more care of the affairs of England, for his successor takes none at all."—One more story is related of him, which is not barren of humour. King Charles's fondness for pleasure, to which he almost always made business give way, used frequently to delay affairs of consequence, from his majesty's disappointing the council of his presence when met for the dispatch of business, which neglect gave great disgust and offence to many of those who were treated with this seeming disrespect. On one of these occasions the duke of Lauderdale, who was naturally impetuous and turbulent, quitted the council-chamber in a violent passion; and meeting Mr Killigrew presently after, expressed himself on the occasion in very disrespectful terms of his majesty. Killigrew begged his grace to moderate his passion, and offered to lay him a wager of 100l. that he himself would prevail on his majesty to come to council in half an hour. The duke, surpris'd at the boldness of the assertion, and warmed by his resentment against the king, accepted the wager; on which Killigrew immediately went to the king, and without ceremony told him what had happened; adding these words, "I know that your majesty hates Lauderdale, though the necessity of your affairs compels you to carry an outward appearance of civility: now, if you choose to get rid of a man who is thus disagreeable to you, you need only go this once to council; for I know his covetous disposition so perfectly, that I am well persuaded, rather than pay this 100l. he would hang himself out of the way, and never plague you more." The king was so pleas'd with the archness of this observation, that he immediately replied, "Well then, Killigrew, I positively will go;" and kept his word accordingly.—Killigrew died in 1682, and was buried in Westminster-abbey.

KILLIGREW (Anne), "a Grace for beauty, and a Muse for wit," as Mr Wood says, was the daughter of Dr Henry Killigrew, brother of the two foregoing, and was born a little before the restoration. She gave early indications of genius, and became eminent in the arts both of poetry and painting. She drew the duke of York and his duchess to whom she was maid of honour, as well as several other portraits and history-pieces; and crowned all her other accomplishments with unblemished virtue and exemplary piety. Mr Dryden seems quite lavish in her praise, though Wood assures us he has said no more of her than she was equal if not superior to. This amiable young woman died of the small-pox in 1685; and the year after her poems were published in a thin 4to volume.

KILLILEAGH, a town of Ireland, in the county of Down and province of Ulster, 80 miles from Dublin; otherwise written *Killyleagh*. It is the principal town in the barony of Duffrin; and seated on an arm of the lake of Strangford, from which it is supplied with a great variety of fish. The family of the Hamiltons created first Lords Clanbois, and afterwards Earls of Clanbrassil, had their seat and residence here in a castle standing at the upper end of the great street; at the lower end of the street is a little safe bay, where

ships lie sheltered from all winds; in the town are some good houses, a decent market house, a horse barrack, and a Presbyterian meeting-house. On an eminence a small distance from the town is a handsome church built in the form of a cross. This place suffered much in the calamitous year 1641. It is now thriving, and the linen manufacture carried on in it, and fine thread made, for which it has a great demand. It returns two members to parliament, patronage in the Blackwood family; and holds three fairs. The celebrated naturalist and eminent physician Sir Haas Sloan was born here 16th April 1660, and his father Alexander Sloan was at the head of that colony of Scots which King James I. settled in the place. This town was incorporated by that king at the instance of the first earl of Clanbois.

KILLLOUGH (otherwise PORT ST ARNE), a port-town of Ireland, situated in the county of Down and province of Ulster, 75 miles from Dublin. It lies north of St John's Point, and has a good quay, where ships lie very safe. The town is agreeably situated; the sea flowing all along the banks of the houses, where ships ride in full view of the inhabitants. There is here a good church, and a horse-barrack. They have good fishing in the bay; but the principal trade of the place consists in the exportation of barley, and the importation of such commodities as are consumed in the adjacent country. A manufacture of salt is also carried on with great advantage. The fairs held here are five. At a small distance from the town is a charter working-school for the reception of 20 children, which was set on foot by the late Mr Justice Ward. There is a remarkable well here call'd *St Scordin's well*, and highly esteem'd for the extraordinary lightness of its water. It gushes out of a high rocky bank, close upon the shore, and is observed never to diminish its quantity in the driest season. There is also a mineral spring near the school, the waters of which the inhabitants affirm to be both purgative and emetic. At a small distance from the town near the sea is a rock in which there is an oblong hole, from whence at the ebbing and flowing of the tide a strange noise is heard somewhat resembling the sound of a huntsman's horn. In an open field about a quarter of a mile from the town towards St John's point there is a very curious cave, which has a winding passage two feet and an half broad, with three doors in it besides the entrance, and leading to a circular chamber three yards in diameter, where there is a fine limpid well. The cave is about 27 yards long.

*Killough Harbour* is tolerably safe and commodious; a small degree of caution, however, is necessary in sailing into it; for a rock stands in the middle of the entrance, covered at half flood, commonly call'd the *water-rock*. Either to the east or west of this rock is a secure passage, the inlet lying south by east and north by west. On the west side of the rock open to Coney-island is a strong quay, and a basin for ships, where they are defended from all winds, within which the harbour on both sides affords good anchorage for vessels of 150 tons. At the end of the quay the channel is 400 yards wide. The bay of Killough is formed by Rin-sad at the Long-point to the east, and St John's point to the west, as the inner harbour is by a peninsula call'd *Coney-isle* from the number of rabbits thereon.

Killybegs  
||  
Kilbrur  
rock

thereon, and not *Caneisle* as Sir William Petty has it. An in petuous sea runs on all this coast in storms and spring tides.

**KILLYBEGS**, a borough and fair town in the county of Donegal and province of Ulster, 123 miles from Dublin. It is situated on the north side of Donegal bay; but is a place of no great trade, though it has a harbour spacious enough to contain a large fleet: it has a bold and ample opening to the sea on the south, and is secured within by the shelter of high lands surrounding it; so that vessels may enter at any time of the tide, there being from 5 to 8 fathom water. The herring fishery is the most considerable of any carried on here; but the town is likely to increase in trade and consequence. It returns two members to parliament, patronage in the Conyngham family. It has two fairs.

**KILMAINHAM**, a town of Ireland, situated about half a mile from Dublin. It has a session-house and handsome gaol; and here the quarter sessions are held for the county of Dublin, and knights of the shire elected for that county. This place was sometimes the seat of government before Dublin castle was converted to that purpose; and though now much decayed, it gives title of baron to the family of Wenman. An ancient priory was founded here, and a house for knights hospitalers of St John of Jerusalem.

**KILMALLOCK**, a town of Ireland, in the county of Limerick and province of Munster, 16 miles from the city of Limerick, and 107 from Dublin.— This town makes a conspicuous figure in the military history of Ireland. In the 16th century it was a populous place; and the remains of the wall, which entirely surrounded the town, and of several large houses, are still to be seen. Edward VI. granted a charter to it with many privileges, as did Queen Elizabeth another, dated 24th April 1584. In 1598, it was invested by the Irish forces, when the earl of Ormond hastened to its relief, and arrived in time to raise the siege: here was also some contest during the grand rebellion in 1641 and 1642. By an inquisition 11 Aug. 29 Eliz. it appears that there had been an abbey in Kilmallock called *Flacispaghe*; on which a stone house was erected. In the cathedral church are the remains of a monument erected over the Verdon family, one of whom represented this town in parliament in 1613. Kilmallock returns two members to parliament; patron Silver Oliver, Esq. This place once gave title of viscount to one of the Darsfield family. Sir James Ware informs us, that an abbey of Dominicans or black friars was built here in the 13th century by the sovereign, brethren, and commonalty. From the many ruins here of castles and ancient buildings, it has acquired the name of the *Irish Balbeck*. The parish church was formerly an abbey for regular canons founded by St Mochoallog, who died between the years 639 and 656; and some writers say, that the Dominican abbey just mentioned was founded in 1291, by Gilbert the second son of John of Calleen. Fairs are held at this town on WhitSun-Tuesday.

**KILMARNOCK**, a populous and flourishing town of Ayrshire in Scotland, noted for its manufacture of carpets, milled hosiery, and Scotch bonnets. It gave the title of earl to the noble family of Boyd, residing in this neighbourhood. This title was forfeited by

the late earl, who, by engaging in the rebellion of 1745, was deprived of his honours, and lost his life on the scaffold. His son, however, who served in the king's army, afterwards succeeded to the earldom of Errol, a title much more ancient and honourable.

**KILMORE**, a bishop's see in the county of Cavan and province of Ulster in Ireland. It was called in former ages *Clunes*, or *Chunis*, i. e. the "sequestered place;" and is situated near Loch Ern. St Fedlimid founded this bishopric in the sixth century; it was afterwards removed to an obscure village called *Triburna*; where it continued until the year 1454, when Andrew Mac Brady bishop of Triburna erected a church on the site of that founded by St Fedlimid, to whose memory it was dedicated, and denominated *Kilmore* or "the great church." At present there are neither cathedral, chapter, nor canons, belonging to this see; the small parish church contiguous to the episcopal house serving for the purpose of a cathedral.

**KILN**, a stove used in the manufacture of various articles. A fabric formed for admitting heat, in order to dry or burn materials placed in it to undergo such operations.

**KILWORTH**, a town of Ireland, situated in the county of Cork and province of Munster, 108 miles from Dublin. It is a thriving place, with a good church, at the foot of a large ridge of mountains called *Kilworth mountains*, through which a good turnpike road is carried from Dublin to Cork: below the town runs the river Funchion, which is well stored with salmon and trout, and discharges itself a mile south of this into the Blackwater. Near Kilworth is a good glebe and vicarage house. At this place is Moorpark, the superb seat of Lord Mountcashel; and adjoining to his lordship's improvements stands the castle of Clough-leagh, boldly situated on the river Funchion, which has stood several sieges. Six fairs are held here.

**KIMBOLTON**, a town of Huntingdonshire, seated in a bottom; and noted for the castle of Kimbolton, the seat of the duke of Manchester. W. Long. o. 15. N. Lat 52. 18.

**KIMCHI** (David), a Jewish rabbi, famous as a commentator on the Old Testament, lived at the close of the 12th and beginning of the 13th centuries. He was a Spaniard by birth, son of rabbi Joseph Kimchi, and brother of rabbi Moses Kimchi, both men of eminent learning among the Jews: but he exceeded them both, being the best Hebrew grammarian the Jews ever had. He wrote a Grammar and Dictionary of that language; out of the former of which Buxtoff made his *Theaurus lingue Hebraeae*, and his *Lexicon lingue Hebraeae* out of the latter. His writings have been held in such estimation among the Jews, that no one can arrive at any reputation in letters and theology without studying them.

**KINCARDINESHIRE**. See MEARNS.

**KINDRED**, in law, persons related to one another, whereof the law reckons three degrees or lines, viz. the descending, ascending, and collateral line. See CONSANGUINITY and DESCENT.

On there being no kindred in the descending line, the inheritance passes in the collateral one.

**KING**, a monarch or potentate who rules singly and sovereignly.

ng. sovereignly over a people.—Camden derives the word from the Saxon *cyning*, which signifies the same; and that from *can* “power,” or *ken* “knowledge,” where with every monarch is supposed to be invested. The Latin *rex*, the Scythian *rex*, the Persian *resh*, the Spanish *rey* and French *roy*, come all, according to Pottel, from the Hebrew *רֶשֶׁת*, *resheth*, “chief, head.”

Kings were not known amongst the Israelites till the reign of Saul. Before him they were governed at first by elders as in Egypt; then by princes of God’s appointment, as Moses and Joshua; then by judges till the time of Samuel; and last of all by kings. See JUDGES.

Most of the Grecian states were governed at first by kings, who were chosen by the people to decide differences and execute a power which was limited by laws. They commanded armies, presided over the worship of the Gods, &c. This royalty was generally hereditary; but if the vices of the heir to the crown were odious to the people, or if the oracle had so commanded, he was cut off from the right of succession; yet the kings were supposed to hold their sovereignty by the appointment of Jupiter. The ensign of majesty was the sceptre, which was made of wood adorned with studs of gold, and ornamented at the top with some figure; commonly that of an eagle, as being the bird of Jove.

Rome also was governed at first by kings, who were elected by the people, with the approbation of the senate and concurrence of the augurs. Their power extended to religion, the revenues, the army, and the administration of justice. The monarchical form of government subsisted 244 years in Rome, under seven kings, the last of whom was Tarquinius Superbus. See ROME.

Among the Greeks the king of Persia had anciently the appellation of the *great king*; the king of France now has that of the *most Christian king*; and the king of Spain has that of *Catholic king*. The king of the Romans is a prince chosen by the emperor, as a coadjutor in the government of the empire.

The kings of England, by the Lateran council, under Pope Julius II. had the title of *Christianissimus* conferred on them; and that of *defender of the faith* was added by pope Leo X. though it had been used by them some time before. The title of *grace* was first given to our kings about the time of Henry IV. and that of *majesty* first to Henry VIII. before which time our kings were called *grace*, *highness*, &c.—In all public instruments and letters, the king styles himself *nos* “we;” though till the time of king John he spoke in the singular number.

The definition of *king* above given, is according to the general acceptation of the term. It will not therefore strictly apply to the sovereign of Britain; and still less of late to that of France, formerly one of the most absolute, now the most degraded, of princes, without power and without consequence. In Britain, a happy mean prevails. The power of the king is indeed subject to great limitations: but they are the limitations of wisdom, and the sources of dignity; being so far from diminishing his honour, that they add a glory to his crown: For while other kings are absolute monarchs over innumerable multitudes of slaves, the king of Britain has the distinguished glory of governing a free people, the least of whom

is protected by the law: and has great prerogatives, and a boundless power in doing good; and is at the same time only restrained from acting inconsistently with his own happiness, and that of his people.

To understand the royal rights and authority in Britain, we must consider the king under six distinct views.

1. With regard to his title. 2. His royal family. 3. His councils. 4. His duties. 5. His prerogative. 6. His revenue.

I. His title. For this, see *HEREDITARY Right*, and *SUCCESSION*.

II. His royal family. See *ROYAL Family*.

III. His councils. See *COUNCIL*.

IV. His duties. By our constitution, there are certain duties incumbent on the king; in consideration of which, his dignity and prerogative are established by the laws of the land: it being a maxim in the law, that protection and subjection are reciprocal. And these reciprocal duties are what Sir William Blackstone apprehends were meant by the convention in 1688, when they declared that king James had broken the original contract between king and people. But however, as the terms of that original contract were in some measure disputed, being alleged to exist principally in theory, and to be only deducible by reason and the rules of natural law, in which deduction different understandings might very considerably differ; it was, after the revolution, judged proper to declare these duties expressly, and to reduce that contract to a plain certainty. So that, whatever doubts might be formerly raised by weak and scrupulous minds about the existence of such an original contract they must now entirely cease; especially with regard to every prince who hath reigned since the year 1688.

The principal duty of the king is, To govern his people according to law. *Nec regibus infinita aut libera potestas* was the constitution of our German ancestors on the continent. And this is not only consonant to the principles of nature, of liberty, of reason, and of society; but has always been esteemed an express part of the common law of England, even when prerogative was at the highest. “The king (saith Bracton, who wrote under Henry III.) ought not to be subject to man; but to God, and to the law: for the law maketh the king. Let the king therefore render to the law, what the law has invested in him with regard to others; dominion, and power: for he is not truly king, where will and pleasure rules, and not the law.” And again: “The king hath a superior, namely God: and also the law, by which he was made a king.” Thus Bracton; and Fortescue also, having full well distinguished between a monarchy absolutely and despotically regal, which is introduced by conquest and violence, and a political or civil monarchy, which arises from mutual consent (of which last species he asserts the government of England to be), immediately lays it down as a principle, that “the king of England must rule his people according to the decrees of the laws thereof; inasmuch that he is bound by an oath at his coronation to the observance and keeping of his own laws.” But to obviate all doubts and difficulties concerning this matter, it is expressly declared by statute 12 and 13 W. III. c. 2. “that the laws of England are the birthright of the people thereof; and all the kings and queens who shall ascend the throne of this

**King.** this realm ought to administer the government of the same according to the said laws, and all their officers and ministers ought to serve them respectively according to the same: and therefore all the other laws and statutes of this realm, for securing the established religion, and the rights and liberties of the people thereof, and all other laws and statutes of the same now in force, are by his majesty, by and with the advice and consent of the lords spiritual and temporal, and commons, and by authority of the same, ratified and confirmed accordingly."

And as to the terms of the original contract between king and people, these, it is apprehended, are now couched in the coronation-oath, which by the Statute 1 W. & M. ft. 1. c. 6. is to be administered to every king and queen who shall succeed to the imperial crown of these realms, by one of the archbishops or bishops of the realm, in the presence of all the people; who on their parts do reciprocally take the oath of allegiance to the crown. This coronation-oath is conceived in the following terms:

"*The archbishop or bishop shall say,* Will you solemnly promise and swear to govern the people of this kingdom of Britain, and the dominions thereto belonging, according to the statutes in parliament agreed, and the laws and customs of the same?—*The king or queen shall say,* I solemnly promise so to do.

"*Archbishop or bishop.* Will you to your power cause law and justice, in mercy, to be executed in all your judgments?—*King or queen.* I will.

"*Archbishop or bishop.* Will you to the utmost of your power maintain the laws of God, the true profession of the gospel, and the Protestant reformed religion established by the law? And will you preserve unto the bishops and clergy of this realm, and to the churches committed to their charge, all such rights and privileges as by law do or shall appertain unto them, or any of them?—*King or queen.* All this I promise to do.

"*After this the king or queen, laying his or her hand upon the holy gospel, shall say,* The things which I have here before promised, I will perform and keep: so help me God. *And then shall kiss the book.*"

This is the form of the coronation-oath, as it is now prescribed by our laws; the principal articles of which appear to be at least as ancient as the Mirror of Justice, and even as the time of Bracton: but the wording of it was changed at the revolution, because (as the statute alleges) the oath itself had been framed in doubtful words and expressions, with relation to ancient laws and constitutions at this time unknown. However, in what form soever it be conceived, this is most indisputably a fundamental and original express contract; though, doubtless, the duty of protection is impliedly as much incumbent on the sovereign before coronation as after: in the same manner as allegiance to the king becomes the duty of the subject immediately on the descent of the crown, before he has taken the oath of allegiance, or whether he ever takes it at all. This reciprocal duty of the subject will be considered in its proper place. At present we are only to observe, that in the king's part of this original contract are expressed all the duties which a monarch can owe to his people, viz. to govern according to

law; to execute judgment in mercy; and to maintain the established religion. And with respect to the latter of these three branches, we may farther remark, that by the act of union, 5 Ann. c. 8. two preceding statutes are recited and confirmed; the one of the parliament of Scotland, the other of the parliament of England: which enact; the former, that every king at his accession shall take and subscribe an oath, to preserve the Protestant religion, and presbyterian church-government in Scotland; the latter, that at his coronation he shall take and subscribe a similar oath, to preserve the settlement of the church of England within England, Ireland, Wales, and Berwick, and the territories thereunto belonging.

V. His prerogative. See PREROGATIVE.

VI. His revenue. See REVENUE.

Having in the preceding articles chalked out all the principal outlines of this vast title of the law, the supreme executive magistrate, or the king's majesty, considered in his several capacities and points of view; it may not be improper to take a short comparative review of the power of the executive magistrate, or prerogative of the crown, as it stood in former days, and as it stands at present. And we cannot but observe, that most of the laws for ascertaining, limiting, and restraining this prerogative, have been made within the compass of little more than a century past; from the petition of right in 3 Car. I. to the present time. So that the powers of the crown are now to all appearance greatly curtailed and diminished since the reign of king James I. particularly by the abolition of the star-chamber and high-commission courts in the reign of Charles I. and by the disclaiming of martial law, and the power of levying taxes on the subject, by the same prince: by the disuse of forest-laws for a century past: and by the many excellent provisions enacted under Charles II.; especially the abolition of military tenures, purveyance, and pre-emption; the *habeas corpus* act; and the act to prevent the discontinuance of parliaments for above three years; and since the revolution, by the strong and emphatical words in which our liberties are asserted in the bill of rights, and act of settlement; by the act for triennial, since turned into septennial elections; by the exclusion of certain officers from the house of commons; by rendering the seats of the judges permanent, and their salaries independent; and by restraining the king's pardon from obstructing parliamentary impeachments. Besides all this, if we consider how the crown is impoverished and stripped of all its ancient revenues, so that it greatly depends on the liberality of parliament for its necessary support and maintenance, we may perhaps be led to think that the balance is inclined pretty strongly to the popular scale, and that the executive magistrate has neither independence nor power enough left, to form that check upon the lords and commons which the founders of our constitution intended.

But, on the other hand, it is to be considered, that every prince, in the first parliament after his accession, has by long usage a truly royal addition to his hereditary revenue settled upon him for his life; and has never any occasion to apply to parliament for supplies, but upon some public necessity of the whole realm. This restores to him that constitutional independence, which at his first accession seems, it must be owned, to

ing. be wanting. And then with regard to power, we may find perhaps that the hands of government are at least sufficiently strengthened; and that a British monarch is now in no danger of being overborne by either the nobility or the people. The instruments of power are not perhaps so open and avowed as they formerly were, and therefore are the less liable to jealous and invidious reflections; but they are not the weaker upon that account. In short, our national debt and taxes (besides the inconveniences before mentioned), have also in their natural consequences thrown such a weight of power into the executive scale of government, as we cannot think was intended by our patriot ancestors; who gloriously struggled for the abolition of the then formidable parts of the prerogative, and by an unaccountable want of foresight established this system in their stead. The entire collection and management of so vast a revenue, being placed in the hands of the crown, have given rise to such a number of new officers, created by and removeable at the royal pleasure, that they have extended the influence of government to every corner of the nation. Witness the commissioners, and the multitude of dependents on the customs, in every part of the kingdom; the commissioners of excise, and their numerous subalterns, in every inland district; the post masters and their servants, planted in every town, and upon every public road; the commissioners of the stamps, and their distributors, which are fully as scattered and fully as numerous; the officers of the salt duty, which, though a species of excise, and conducted in the same manner, are yet made a distinct corps from the ordinary managers of that revenue; the surveyors of houses and windows; the receivers of the land-tax; the managers of lotteries; and the commissioners of hackney-coaches; all which are either mediately or immediately appointed by the crown, and removable at pleasure without any reason assigned: these, it requires but little penetration to see, must give that power, on which they depend for subsistence, an influence most amazingly extensive. To this may be added the frequent opportunities of conferring particular obligations, by preference in loans, subscriptions, tickets, remittances, and other money-transactions, which will greatly increase this influence; and that over those persons whose attachment, on account of their wealth, is frequently the most desirable. All this is the natural, though perhaps the unforeseen, consequence of erecting our funds of credit, and, to support them, establishing our perpetual taxes: the whole of which is entirely new since the restoration in 1660; and by far the greatest part since the revolution in 1688. And the same may be said with regard to the officers in our numerous army, and the places which the army has created. All which put together give the executive power so persuasive an energy with respect to the persons themselves, and so prevailing an interest with their friends and families, as will amply make amends for the loss of external prerogative.

But though this profusion of offices should have no effect on individuals, there is still another newly acquired branch of power; and that is, not the influence only, but the force of a disciplined army: paid indeed ultimately by the people, but immediately by the crown; raised by the crown, officered by the

crown, commanded by the crown. They are kept on foot, it is true, only from year to year, and that by the power of parliament: but during that year, they must by the nature of our constitution, if raised at all, be at the absolute disposal of the crown. And there need but few words to demonstrate how great a trust is thereby reposed in the prince by his people: A trust that is more than equivalent to a thousand little troublesome prerogatives.

Add to all this, that besides the civil list, the immense revenue of almost seven millions sterling, which is annually paid to the creditors of the public, or carried to the sinking fund, is first deposited in the royal exchequer, and thence issued out to the respective offices of payment. This revenue the people can never refuse to raise, because it is made perpetual by act of parliament; which also, when well considered, will appear to be a trust of great delicacy and high importance.

Upon the whole, therefore, it seems clear, that whatever may have become of the *nominal*, the real power of the crown has not been too far weakened by any transactions in the last century. Much is indeed given up; but much is also acquired. The stern commands of prerogative have yielded to the milder voice of influence: the slavish and exploded doctrine of non-resistance has given way to a military establishment by law; and to the disuse of parliaments has succeeded a parliamentary trust of an immense perpetual revenue. When, indeed, by the free operation of the sinking fund, our national debts shall be lessened; when the posture of foreign affairs, and the universal introduction of a well planned and national militia, will suffer our formidable army to be thinned and regulated; and when (in consequence of all) our taxes shall be gradually reduced; this adventitious power of the crown will slowly and imperceptibly diminish, as it slowly and imperceptibly rose. But till that shall happen, it will be our especial duty, as good subjects and good Englishmen, to reverence the crown, and yet guard against corrupt and servile influences from those who are intrusted with its authority; to be loyal, yet free; obedient, and yet independent; and above every thing, to hope that we may long, very long, continue to be governed by a sovereign, who, in all those public acts that have personally proceeded from himself, hath manifested the highest veneration for the free constitution of Britain; hath already in more than one instance remarkably strengthened its outworks; and will therefore never harbour a thought, or adopt a persuasion, in any the remotest degree detrimental to public liberty.

*King at Arms*, or of *Arms*, is an officer of great antiquity, and anciently of great authority, whose business is to direct the heralds, preside at their chapters, and have the jurisdiction of armoury.

In England there are three kings of arms, viz. garter, clarenceux, and norroy.

*Garter*, principal *King at Arms*, was instituted by Henry V. His business is to attend the knights of the garter at their assemblies, to marshal the solemnities at the funerals of the highest nobility, and to carry the garter to kings and princes beyond the sea; on which occasion he used to be joined in commission with some principal peer of the kingdom. See *GARTER*.

King.

*Clarencieux KING at Arms*, is so called from the duke of Clarence, to whom he first belonged. His office is to marshal and dispose the funerals of all the inferior nobility, as baronets, knights, esquires, and gentlemen, on the south side of the Trent. See CLARENCEUX.

*Norroy KING at Arms*, is to do the same on the north side of the river Trent.

These two last are also called *provincial heralds*, in regard they divide the kingdom between them into provinces. By charter, they have power to visit noblemen's families, to set down their pedigrees, distinguish their arms, appoint persons their arms, and with garter to direct the other heralds.

Anciently the kings at arms were created and solemnly crowned by the kings of England themselves; but of later days, the earl marshal has a special commission at every creation to personate the king.

*Lyon KING at Arms*, for Scotland, is the second king at arms for Great Britain; he is invested and crowned with great solemnity. To him belongs the publishing king's proclamations, marshalling funerals, reversing arms, &c. See LYON.

KING (Dr John), a learned English bishop in the 17th century, bred at Westminster-school, and afterward at Christ church Oxford. He was appointed chaplain to queen Elizabeth. In 1605 he was made dean of Christ church, and was for several years vice-chancellor of Oxford. In 1611 he was advanced to the bishopric of London. Besides his *Lectures upon Jonah*, delivered at York, he published several sermons King James I. used to style him *the king of preachers*; and lord chief justice Coke often declared, that *he was the best speaker in the star-chamber in his time*. He was so constant in preaching after he was a bishop, that, unless he was hindered by want of health, he omitted no Sunday whereon he did not visit some pulpit in London or near it. Soon after his death, the Papists reported, that he died a member of their church. But the falsity of this story was sufficiently exposed by his son Mr Henry King, in a sermon at St Paul's cross soon after; by bishop Godwin in the *Appendix to his Commentarius de presulibus Angliæ*, printed in 1622; and by Mr John Gee, in his book, intitled, *The foot out of the snare*.

KING (Dr Henry), bishop of Chichester, eldest son of the former, was born in 1591, and educated at Oxford. He became an eminent preacher, and chaplain to king James I. and Charles I. In 1638 he was made dean of Rochester; and in 1641 was advanced to the see of Chichester. Upon the breaking out of the civil wars, and the dissolution of episcopacy, he was treated with great severity by the friends to the parliament; but recovered his bishopric at the restoration. This worthy prelate, who had a most amiable character, died in 1669; and was interred at his cathedral of Chichester, where a monument was erected to his memory. He published, 1. The psalms of David turned into metre. 2. Poems, elegies, paradoxes, and sonnets. 3. Several sermons, and other works.

KING (Dr William), a facetious English writer in the beginning of the 18th century, was well descended, being allied to the noble families of Clarendon and Rochester. He was elected a student of Christ church from Westminster-school in 1681, aged 18. He af-

terward entered upon the law line, and took the degree of doctor of civil law. He soon acquired a considerable reputation as a civilian, and was in great practice. He attended the earl of Pembroke, lord lieutenant of Ireland, into that kingdom, where he was appointed judge-advocate, sole commissioner of the prizes, keeper of the records, vicar-general to the lord primate of Ireland; was countenanced by persons of the highest rank, and might have made a fortune. But so far was he from heaping up riches, that he returned to England with no other treasure than a few merry poems and humorous essays, and retired to his studious place at Christ church. He died on Christmas day in 1712, and was interred in the Cloisters of Westminster abbey. His writings are pretty numerous. The principal are, 1. *Animadversions on a pretended account of Denmark*, wrote by Mr Moleworth, afterwards lord Moleworth. The writing of these procured Dr King the place of secretary to princess Anne of Denmark. 2. *Dialogues of the dead*. 3. *The art of love*, an imitation of Ovid *De arte amandi*. 4. A volume of poems. 5. *Useful transactions*. 6. An historical account of the heathen gods and heroes. 7. Several translations—As to the character of Dr King, he naturally hated business, especially that of an advocate; but made an excellent judge when appointed one of the court of delegates. His chief pleasure consisted in trifles; and he was never happier than when he thought he was hid from the world. Yet he loved company, provided they were such as tallied with his humour. He would say a great many ill natured things, but never do one. He was made up of tenderness and pity, and tears would fall from him on the smallest occasion. His education had been strict, and he was naturally of a religious disposition.

KING (Dr William), archbishop of Dublin in the 18th century, was descended from an ancient family in the north of Scotland, but born in the county of Antrim in the north of Ireland. In 1674 he went into priest's orders. In 1679 he was promoted by his patron, Dr Parker, archbishop of Dublin, to the chancellorship of St Patrick. In 1677 Peter Manby, dean of Londonderry, having published at London, in 4to, a pamphlet intitled *Considerations which obliged Peter Manby dean of Londonderry to embrace the Catholic religion*, our author immediately wrote an answer. Mr Manby, encouraged by the court, and assisted by the most learned champions of the church of Rome, published a reply under this title, *A reformed catechism, in two dialogues concerning the English reformation, &c. in reply to Mr King's answer, &c.* Our author soon rejoined in *A vindication of the answer*. Mr Manby dropped the controversy; but dispersed a loose sheet of paper, artfully written, with this title, *A letter to a friend, showing the vanity of this opinion, that every man's sense and reason are to guide him in matters of faith*. This Dr King retorted in *A vindication of the Christian religion and reformation, against the attempts of a letter, &c.* In 1689 he was twice confined in the tower by order of king James II and the same year commenced doctor of divinity. In 1690, upon king James's retreat to France after the battle at the Boyne, he was advanced to the see of Derry. In 1692 he published at London in 4to, *The state of the Protestants of Ireland under the late king James's government, &c.*

"A history (says bishop Burnet), as truly as it is finely written." He had by him at his death attested vouchers of every particular fact alleved in this book, which are now in the hands of his relations. However, it was soon attacked by Mr Charles Lessly. In 1693 our author finding the great number of Protestant dissenters, in his diocese of Derry, increased by a vast addition of colonies from Scotland, in order to persuade them to conformity to the established church, published *A discourse concerning the inventions of men in the worship of God*. Mr Joseph Boyse, a dissenting minister, wrote an answer. The bishop answered Mr Boyse. The latter replied. The bishop rejoined. In 1702 he published at Dublin, in 4to, his celebrated treatise *De origine mali*. Mr Edmund Law, M. A. fellow of Christ's college in Cambridge, afterward published a complete translation of this, with very valuable notes, in 4to. In the second edition he has inserted, by way of notes, a large collection of the author's papers on the same subject, which he had received from his relations after the publication of the former edition. Our author in this excellent treatise has many curious observations. He asserts and proves that there is more moral good in the earth than moral evil. A sermon by our author, preached at Dublin in 1709, was published under the title of *Divine predestination and foreknowledge consistent with the freedom of man's will*. This was attacked by Anthony Collins, Esq; in a pamphlet intitled, "*A vindication of the divine attributes; in some remarks on the archbishop of Dublin's sermon intitled, Divine predestination, &c.*" He published likewise, *A discourse concerning the consecration of churches; showing what is meant by dedicating them, with the grounds of that office*. He died in 1720.

KING (Dr William), late principal of St Mary's hall, Oxford, son of the reverend Peregrine King, was born at Stepney in Middlesex, in the year 1685. He was made doctor of laws in 1715, was secretary to the duke of Ormond, and earl of Arran, as chancellors of the university; and was made principal of St Mary's-hall on the death of Dr Hudson in 1719. When he stood candidate for member of parliament for the university, he resigned his office of secretary, but enjoyed his other preferment and it was all he did enjoy to the time of his death. Dr Clark, who opposed him, carried the election; and after this disappointment, he in the year 1727 went over to Ireland, where he is said to have written an epic poem, called *The Toast*, which was a political satire, printed and given away to his friends, but never sold. On the dedication of Dr Radcliff's library in 1749, he spoke a Latin oration in the theatre at Oxford, which was received with the highest acclamations; but it was otherwise when printed, he being attacked in several pamphlets on account of it. Again, at the memorable contested election in Oxfordshire 1755, his attachment to the old interest drew on him the resentment of the new, and he was libelled in newspapers and pamphlets, against which he defended himself in an *Apology*, and warmly retaliated on his adversaries. He wrote several other things, and died in 1762. He was a polite scholar, an excellent orator, an elegant and easy writer, and esteemed by the first men of his time for his learning and wit.

KING (Peter), lord high chancellor of Great Britain, was descended of a good family of that name in Somersetshire, and son to an eminent grocer and salter in the city of Exeter in Devonshire. He was born at Exeter in 1669, and bred up for some years to his father's business; but his inclination to learning was so strong, that he laid out all the money he could spare in books, and devoted every moment of his leisure hours to study: so that he became an excellent scholar before the world suspected any such thing; and gave the public a proof of his skill in church history, in his *Inquiry into the constitution, discipline, unity, and worship, of the primitive church, that flourished within the first 300 years after Christ*, London, 1691, in 8vo. This was written with a view to promote the scheme of a comprehension of the dissenters. He afterwards published the second part of the *Inquiry into the constitution, &c.*; and having desired, in his preface, to be shown, either publicly or privately, any mistakes he might have made, that request was first complied with by Mr Edmund Elys; between whom and our author there passed several letters upon the subject, in 1692, which were published by Mr Elys in 1694, 8vo, under the title of *Letters on several subjects*. But the most formal and elaborate answer to the *Inquiry* appeared afterwards, in a work intitled, *Original draught of the primitive church*.

His acquaintance with Mr Locke, to whom he was related, and who left him half his library at his death, was of great advantage to him: by his advice, after he had studied some time in Holland, he applied himself to the study of the law; in which profession his learning and diligence made him soon taken notice of. In the two last parliaments during the reign of King William, and in five parliaments during the reign of Queen Anne, he served as burgetts for Beer-Allston in Devonshire. In 1702, he published at London, in 8vo, without his name, his *History of the apostle's creed*, with critical observations on its several articles; which is highly esteemed. In 1708, he was chosen recorder of the city of London; and in 70, was one of the members of the house of commons at the trial of Dr Sacheverell. In 1714, he was appointed lord chief justice of the common-pleas; and the April following, was made one of the privy-council. In 1715, he was created a peer by the title of *Lord King, baron of Ockham in Surry*, and appointed lord high chancellor of Great Britain; in which post he continued till 1733, when he resigned; and in 1734 died at Ockham in Surry.

*KING's Bench*. See BENCH (*King's*).

*KING Bird*. See PARADISEA.

*KING's Fidler*. See ALCEDO.

*Books of Kings*, two canonical books of the Old Testament, so called, because they contain the history of the kings of Israel and Judah from the beginning of the reign of Solomon down to the Babylonish captivity, for the space of near 600 years. The first book of kings contains the latter part of the life of David, and his death; the flourishing state of the Israelites under Solomon, his building and dedicating the temple of Jerusalem, his shameful defection from the true religion, and the sudden decay of the Jewish nation after his death, when it was divided into two kingdoms: the rest of the book is taken up in relating the acts of

**King, Kingdom.** four kings of Judah and eight of Israel. The second book, which is a continuation of the same history, is a relation of the memorable acts of 16 kings of Judah, and 12 of Israel, and the end of both kingdoms, by the carrying of the 10 tribes captive into Assyria by Salmanassar, and the other two into Babylon by Nebuchadnezzar.

It is probable that these books were composed by Ezra, who extracted them out of the public records, which were kept of what passed in that nation.

*King's-County*, a county of the province of Leinster in Ireland, taking its name from king Philip of Spain, husband to queen Mary. It is bounded on the north by West Meath; on the south by Tipperary and Queen's-county, from which it is divided by the Barrow; and part of Tipperary and Galway on the west, from which it is separated by the Shannon. It is a fine fruitful country, containing 757.510 Irish plantation acres. 56 parishes, 11 baronies, and two boroughs, and returns six members to parliament. It is about 47 miles long and 17 broad, and the chief town is Philipstown.

*King's Evil, or Scrophula.* See *MEDICINE-Index.*

**KING TE-TCHING**, a famous village belonging to the district of Jao-tcheu fou, a city of China in the province of Kiang-si. This village, in which are collected the best workmen in porcelain, is as populous as the largest cities of China. It is reckoned to contain a million of inhabitants, who consume every day more than ten thousand loads of rice. It extends a league and a half along the banks of a beautiful river, and is not a collection of straggling houses intermixed with spots of ground; on the contrary, the people complain that the buildings are too crowded, and that the long streets which they form are too narrow; those who pass through them imagine themselves transported into the midst of a fan, where nothing is heard around but the noise of porters calling out to make way. Provisions are dear here, because every thing consumed is brought from remote places; even wood, so necessary for their furnaces, is actually transported from the distance of an hundred leagues. This village, notwithstanding the high price of provisions, is an asylum for a great number of poor families, who could not subsist any where else. Children and invalids find employment here, and even the blind gain a livelihood by pounding colours. The river in this place forms a kind of harbour about a league in circumference: two or three rows of barks placed in a line sometimes border the whole extent of this vast basin.

**KINGDOM**, the territories or extent of country subject to a king.

**KINGDOMS**, in natural history. Most naturalists and chemists divide all natural bodies into three great classes, which they call *kingdoms*. These are the *mineral*, the *vegetable*, and the *animal* kingdoms.

This great and full division is founded on this consideration, that any plant or vegetable which is produced, which grows, which is organized, which contains a seed, and which produces its like, seems to be a being very distinct and different from a stone or a metal, in which we at most observe only a regular arrangement of parts, but not a true organization, and which contains no seed by which it is capable of reproduction; and another foundation of this division is, that an

animal differs no less from a simple plant, by sensation, by the use of its senses, and by the power of voluntary motion which it possesses, while these qualities do not belong to any thing which is merely vegetable.

But notwithstanding these so distinctive marks, philosophers pretend, that this division of natural bodies into classes is only ideal. They affirm, that, by observing nature attentively, we may perceive, that all her productions are connected together by an uninterrupted chain; and that by surveying the several beings, we must be convinced, that any one being differs very little from some other two between which it seems to be placed; so that we may descend from the most perfect animal to the rudest mineral by insensible degrees; and without finding any interval from which a division might be made. The opinions of naturalists are therefore divided upon this subject; and each opinion seems to be founded upon observations, analogies, and reasonings more or less conclusive.

If we avoid investigating extremes, however, the distinctive marks must be acknowledged sufficiently obvious to justify the triple division above mentioned, and to discriminate the individuals of each.

For a general view of the operations or conduct of nature in those her three kingdoms, see the article **NATURE**. For a particular consideration of them—(in the animal-kingdom), see **ZOOLOGY**, **ANIMAL**, **BRUTE**, **BIRD**, **ORNITHOLOGY**, **INSECT**, **ENTOMOLOGY**, **ICHTHYOLOGY**, **FISH**, *COMPARATIVE Anatomy*, and the different animals under their respective names;—(in the vegetable kingdom), **BOTANY**, **PLANT**, **AGRICULTURE**, **VEGETATION**, **DEFOLIATION**, **FRONDESCENTIA**, **GEMMATIO**, **FRUIT**, **LEAF**, **GERMINATION**, &c. and the different plants under their respective names;—(in the mineral kingdom), **MINERALOGY**, **METALLURGY**, and the different stones and metals under their respective names.

In what remains of this article we shall consider natural bodies only in a chemical view; that is to say, relatively to the several principles which we obtain in the analysis of those bodies. In the decomposition of all beings truly living, organized, and containing within themselves a seed by which they may be reproduced, such as vegetables and animals, we always obtain an inflammable, fat, or oily substance; and on the contrary, we do not find the smallest trace of this principle in any substance purely mineral, not even in sulphur, which is the most inflammable of all these substances. On the other side, if we carefully examine and compare with each other the analogous principles obtained from the three kingdoms; such as the saline substances obtained in the analysis of animals, vegetables, and minerals; we shall easily perceive, that all the saline matter which comes from the vegetable or animal kingdom, is altered by oil, while all the saline matter which comes from the mineral kingdom is entirely free from oil.

We ought to observe here, that because any matter is found in one or more individuals of any kingdom, we must not therefore conclude, that it belongs to the kingdom of such individuals; for we may be convinced, from a slight observation of nature, that by a thousand combinations, and particular circumstances, substances of quite different classes or kingdoms are daily found mixed and confounded together. Thus, for example;

within.

ons. within the earth, and even at great depths, that is, in the region appropriated to minerals, sometimes substances are found evidently oily, such as all bitumens: but we at the same time can prove, and all the observations of natural history prove, that these oily substances are only accidentally within the earth, and that they proceed from the vegetable or animal bodies which have been buried in the earth by some of those great revolutions which have happened from time to time upon the surface of our globe. Also in decomposing several vegetables and animals, salts are obtained; such as common salt, Glauber's salt, and others, which contain nothing oily, and which are consequently matters evidently mineral. But, on the other side, we are certain that these mineral salts are extraneous to the animals and vegetables in which they are found; and that they are only introduced into these living bodies, because they happen to be mixed with the matters which have been applied to them as aliments and that they ought not to be numbered amongst their principles. The proof of this is, that not only the quantity of these mineral salts is not uniform in animals and vegetables; but also, that not a particle of such salts is contained in some plants and animals equally strong and healthy, and of the same species as those in which these salts have generally been observed.

In the second place, we observe, that oils do only exit in the proximate principles of vegetables and animals; that is, in those of their principles which enter immediately into their composition, when those principles have not been altered by farther decompositions, and consequently when they still preserve their animal or vegetable character; for by a natural putrefaction continued during a long time, or by chemical operations, not only the materials of which animal and vegetable bodies are formed may be deprived entirely of oil, but also this oil may itself be entirely destroyed or decomposed. These substances in that state contain nothing by which they can be distinguished from minerals. The earths, for example, of vegetables and animals, when they are deprived, by a sufficient calcination of all inflammable matter, have been thought to become entirely similar to the calcareous and argillaceous earths found within the globe, and which may be considered as mineral substances, although probably they have been formerly a part of animal and vegetable bodies. See BONES.

Hence we conclude, that, when we consider natural bodies in a chemical view, we ought to divide them into two great classes. The first class is of substances inanimate, unorganised, and the principles of which have a degree of simplicity which is essential to them: these are minerals. The other class contains all those bodies which not only have been distinctly organised, but which also contain an oily matter, which is no where to be found in substances which have not made part of animate bodies, and which, by combining with all the other principles of these animate bodies, distinguishes these principles from those of minerals by a less degree of simplicity. This second class contains vegetables and animals. We ought also to remark, that the oil contained in vegetable and animal substances, renders them susceptible of fermentation, properly so called, which cannot by any means take place in any mineral.

We shall now proceed to examine, if, by comparing the principles obtained in the decomposition of vegetables with those obtained in the decomposition of animals, we can find some essential character by which these two kingdoms may be chemically distinguished, in the same manner as we have seen that both of them may be distinguished from minerals. From experiments we indeed learn, that the principles of vegetables differ evidently enough from those of animals; that in general the saline principles of the former are acid, and are transformable in great measure into fixed alkali by incineration, while the principle of the latter are volatile alkalis, or easily changeable into these; that vegetables are much farther removed from putrefaction than animals; lastly, that oils truly animal have a character different from vegetable oils, and are in general more attenuated, or at least more disposed to be attenuated and volatilised. But we must at the same time confess, that these differences are not clear and decisive, like those betwixt these two kingdoms and the mineral kingdom; for we do not find any essential principle, either in animals or in vegetables, which is not also to be found in the other. In some plants, chiefly the cruciform, as much volatile alkali, as little fixed alkali, and as much disposition to putrify, are found as in animal-matters; and thence we conclude, that if these two great classes of natural bodies differ chemically from each other, this difference proceeds only from the quantities or proportions of their several principles and properties, and not from any thing distinct and peculiar; nor is it similar to the manner in which both vegetable and animal substances differ from minerals, namely, by containing an oil, and possessing a fermentable quality. Besides, the degrees of the chemical difference betwixt these three great classes of natural bodies are found to be the same, in whatever manner we consider them or compare them together. See CHEMISTRY, *passim*.

KINGHORN, a parliament town in the county of Fife in Scotland, on the Frith of Forth, directly opposite to Leith. Here is a manufacture of thread stockings knit by the women; the men, being chiefly mariners, are employed in coasting ships, in the fishery, or the passage-boats from hence to Leith, from which the town of Kinghorn derives considerable advantage. This place gives a second title to the earl of Strathmore.

KINGSBRIDGE, a town of Devonshire, 217 miles from London. It is a pretty place, with a harbour for boats, a free school, a market, and a fair. This is a chapel of ease to Cheston, and has a bridge over the Salcomb to Dodbrook.

KINGSCLERE, a pleasant town of Hampshire, situated on the Oxford road from Basingstoke. It is 56 miles from London, and was once the seat of the Saxon kings. It has a market and two fairs.

KINGSFERRY, in Kent, the common way from the main land into the isle of Shepey; where a cable of about 140 fathom in length, fastened at each end across the water, serves to get the boat over by hand. For the maintenance of this ferry and keeping up the highway leading to it through the marshes for above one mile in length, and for supporting a wall against the sea, the land-occupiers tax themselves yearly one penny *per acre* for fresh marsh-land, and one penny for

3 every;

**Kingston.** every 10 acres of salt marsh-land. Here is a house for the ferry keeper, who is obliged to tow all travellers over free, except on these four days, viz. Palm Monday, Whit-Monday, St James's-day, and Michaelmas-day, when a horseman pays two-pence and a footman one penny. But on Sunday, or after eight o'clock at night, the ferry keeper demands six pence of every horseman, and two-pence of every footman, whether strangers or the land-occupiers.

**KINGSTON UPON THAMES**, a town of Surry in England, situated 13 miles from London. It takes its name from having been the residence of many of our Saxon kings, some of whom were crowned here on a stage in the market-place. It has a wooden bridge of 20 arches over the Thames, which is navigable here by barges. There is another bridge here of brick, over a stream that comes from a spring in a cellar four miles above the town, and forms such a brook as to drive two mills not above a bow-shot from it and from each other. It is generally the place for the summer-assizes of this county, there being a gallows on the top of the hill that overlooks it. It is a populous, trading, well-built town, and in the reigns of King Edward II and III. sent members to parliament. It has a free-school; an alms-house built in 1670 for six men and six women, and endowed with lands to the value of 80*l.* a year; and a charity school for 30 boys, who are all clothed. Here is a spacious church with eight bells, adjoining to which, on the north side, was formerly a chapel dedicated to St Mary, in which were the pictures of three of the Saxon kings that were crowned here, and also that of King John, who gave the inhabitants of this town their first charter of incorporation. But these were all destroyed by the fall of this chapel in 1730. Here is a good market for corn, &c. and three fairs.

**KINGSTON upon Hull**, a town in the east riding of Yorkshire, 173 miles from London. Its common name is simply *Hull*. It is situated at the conflux of the rivers Hull and Humber, and near the place where the latter opens into the German Ocean. It lies so low, that by cutting the banks of the Humber the country may be laid under water for five miles round. Towards the land it is defended by a wall and a ditch, with the farther fortification of a castle, a citadel, and a block house. A dock was begun here, but after great expence left unfinished.—A new cut has been lately made to Hull by Wighton. The town is large and populous, containing two churches, several meeting-houses, a free school, a charity school, and some hospitals. Among the latter is one called *Trinity-house*, in which are maintained many distressed seamen, both of Hull and other places, that are members of its port. It is governed by 12 elder brethren and six assistants; out of the former are chosen annually two wardens, and out of the younger brethren two stewards; they determine questions between masters and seamen, and other sea matters. A handsome infirmary has lately been erected without the town to the north. Here are also an exchange and a custom-house, and over the Hull a stone bridge consisting of 14 arches. A good harbour was made here by Richard II. This town has not only the most considerable inland traffic of any port in the north of England, but a foreign trade superior to any in the kingdom, excepting the

ports of London, Bristol, Liverpool, and Yarmouth. By means of the many large rivers that fall into the Humber, it trades to almost every part of Yorkshire, as well as to Lincolnshire, Nottinghamshire, Staffordshire, Derbyshire, and Cheshire; the commodities of which counties are brought hither, and exported to Holland, Hamburgh, France, Spain, the Baltic, and other parts of Europe. In return for those, are imported iron, copper, hemp, flax, canvas, Russia lincn and yarn, besides wine, oil, fruit, and other articles. Such quantities of corn are also brought hither by the navigable rivers, that Hull exports more of this commodity than London. The trade of Hull with London, particularly for corn, lead, and butter, and with Holland and France, in times of peace, for those commodities, as well as for cloth, kerseys, and other manufactures of Yorkshire, is so considerable as to employ not only single vessels, but fleets; the Hull fleets to London being generally from 50 to 60 sail, and in time of war frequently 100 sail or upwards. The mayor of Hull has two swords, one given by King Richard II. the other by Henry VIII. but only one is borne before him at a time; also a cap of maintenance, and an oar of lignum vitæ as a badge of his admiralty jurisdiction within the limits of the Humber. This town gave title of earl to Robert Pierpoint of Holme Pierpoint, viscount Newark, created in the 4th of Charles I. Being unfortunately slain in crossing the Humber in 1643, he was succeeded by his son Henry, created marquis of Dorchester in 1645, only for life; who dying in 1680, without male issue, was succeeded in the earldom by Robert, grandson of his younger brother William Pierpoint of Thoresby; who dying unmarried in 1682, left this honour to William his brother and heir; and he also dying without issue in 1690, it descended to his brother Evelyn, who was further advanced to the honours of marquis of Dorchester in 1706 and duke of Kingston in 1715; and dying in 1725 was succeeded by his grandson Evelyn last duke of Kingston, who died in 1773, and the title became extinct.

**KINGSTON**, a town of Ireland, in the province of Leinster and capital of King's county. W. Long. 7. 20. N. Lat. 53 15. It is otherwise called *Philippstown*.

**KINGSTON**, a town of Jamaica, seated on the north side of the bay of Port-Royal. It was founded in the year 1693, when the repeated desolations by earthquake and fire had driven the inhabitants from Port-Royal. It extends a mile from north to south, and about as much from east to west, on the harbour. It contains about 3000 houses, besides negro-houses and warehouses. The number of white inhabitants is about 8000; of free people, of colour, 1500; and of slaves, about 14,000. It is the county-town, where the assizes are held, in January, April, July, and October, and last about a fortnight. It is a place of good trade; and is much resorted to by merchants and seamen, because most of the ships come to load and unload their cargoes here. W. Long. 76. 32. N. Lat. 17. 40.

**KINGTON**, or **KYNETON**, a pretty large town in Herefordshire, 146 miles from London. It is situated on the river Arrow, and is inhabited chiefly by clothiers, who drive a considerable trade in narrow cloth. It has a charity-school, a market, and three fairs.

airs. The markets on Wednesday before Easter, Whitfuntide, and Christmas, are so considerable for corn, cattle, leather, home made linen and woollen cloth, and all sorts of provisions, that they are more like fairs.

KINNOR, or CHINNOR. See CHINNOR.

KINO. in the materia medica, a gum resin. This drug was first recommended to the attention of medical practitioners by Dr Fothergill, as being a very useful vegetable astringent; and in the hands of other practitioners it has been so far found to answer the character he gave of it, that it is now in very common use. It has a considerable resemblance to the catechu; but is much more of a resinous nature, and of a less firm texture: it is also redder and more astringent; its watery solution more decomposable by acids; and its ink less permanent. Its colouring and astringent matter are more perfectly taken up by spirit than by water, though water readily enough extracts a considerable share of both. It is used as an astringent in diarrhoea, hæmorrhagies, &c. In proof-spirit it forms an elegant tincture; and it is a principal ingredient in the *pulvis stypticus*, and some other officinal compositions.

KINROSS, the county-town of Kinrosshire in Scotland, situated in W. Long. 3. 7. N. Lat. 56. 15. on the west side of Lochleven, a fresh-water lake about 10 miles in compass, abounding with pike, trout, perch, and water fowl. The manufactures are linen and some cutlery ware. The house of Kinross, an elegant ancient structure, stands on the north side of the town. Kinross sends a member to parliament by turns with Clackmannan. In the lake are two islands; on one of which appear the ruins of a priory, heretofore possessed by the Culdees; the other is famous for the castle in which Queen Mary was imprisoned by her rebellious subjects.

KINSALE, a town of the county of Cork in Ireland, situated at the mouth of the river Ban or Bandon, 136 miles from Dublin. It is reckoned the third town in the kingdom, and inferior only to Cork in point of trade. It is neat, well built, and wealthy; is governed by a sovereign and recorder, and returns two members to parliament, patronage in the Southwell family. It is defended by a strong fort built by king Charles II. called *Charles's Fort*; and on the opposite shore there are two well built villages, called *Cove* and *Scilly*. In the town and liberties are 6 parishes, 30 plough lands, and therein 6846 acres. The barracks hold 12 companies of foot, besides a regiment at Charles's fort. In the centre of the town is a good market house, and near it a strong built prison; and there are scattered up and down the ruins of several monasteries and religious houses. It has two fairs. In time of war Kinsale is a place of much business, being then frequented by rich homeward bound fleets and ships of war, for which reason most of the houses are then let at double rents. The harbour is very commodious, and perfectly secure; so large that the English and Dutch Smyrna fleets have anchored in it at the same time. There is a dock and yard for repairing ships of war, and a crane and gun wharf for landing and shipping heavy artillery. Ships may sail into or out of this harbour, keeping in the middle of the channel, with

the utmost safety. Within the haven on the west side lies a great shelf, which shoots a great way off from the land; but leaves an ample passage by the side of it, in which, as in all the rest of the harbour, it is many fathoms deep. Lord Kinsale has the ancient privilege of keeping his hat on in the king's presence. Kinsale gives the title of *baron* to the very ancient family of Courcy, lineally descended from John de Courcy earl of Ulster, who from him have the privilege to be covered in the presence of the king of England.

KINFORD, a royal borough of Aberdeenshire in Scotland, situated on the river Don, in W. Long 2. 5. N. Lat. 57. 38. It gives the title of *earl* to a branch of the noble family of Keith, but in other respects is inconsiderable.

KINTYRE. See CANTIRE.

KIOF, or KIOU, a considerable town of Poland, and capital of the Ukrain in the palatinate of the same name, with an archbishop's see and a castle. It belongs to Russia, and carries on a considerable trade. It is divided into the Old and New Town, and seated on the river Nieper, in E. Long. 31. 51. N. Lat. 50. 12.

KIPPING (Henry), in Latin *Kippingius*, a learned German Lutheran born at Boltuck; where, after having received the degree of master of arts, he was met by some soldiers who pressed him into the service. This, however, did not prevent his following his studies. One day while he was upon duty, holding his musket in one hand and the poet Statius in the other, a Swedish counsellor, who perceived him in that attitude, came up to him, entered into discourse with him, and then taking him to his house made him his librarian, and procured him the under-rectorship of the college of Bremen, where he died in 1678. He wrote many works in Latin; the principal of which are, 1. A treatise on the antiquities of the Romans. 2. Another on the works of Creation. 3. Several dissertations on the Old and New Testament, &c.

KIRCH (Christian Frederic), of Berlin, a celebrated astronomer, was born at Guben in 1694, and acquired great reputation in the observatories of Dantzic and Berlin. Godfrey Kirch his father, and Mary his mother, acquired considerable reputation by their astronomical observations. This family corresponded with all the learned societies of Europe, and their astronomical works are in high repute.

KIRCHER (Athanasius), a famous philosopher and mathematician, was born at Fulde in 1601. In 1618 he entered into the society of the Jesuits, and taught philosophy, mathematics, the Hebrew and Syriac languages, in the university of Wirtzburg, with great applause till the year 1631. He went to France on account of the ravages committed by the Swedes in Franconia, and lived some time at Avignon. He was afterwards called to Rome, where he taught mathematics in the Roman college, collected a rich cabinet of machines and antiquities, and died in 1680.—The quantity of his works is immense, amounting to 22 vols in folio, 11 in quarto, and 3 in 8vo; enough to employ a man for a great part of his life even to transcribe them. Most of them are rather curious than useful; many of them visionary and fanciful; and if they are not always accompanied with the greatest ex-

Kircher  
||  
Kircher

Kirchman  
Kirky.

aetness and precision, the reader, it is presumed, will not be astonished. The principal of his works are, 1. *Prædilesiones magneticae*. 2. *Primitiæ gnomonica catoptrica*. 3. *Ars magna lucis & umbræ*. 4. *Musurgia universalis*. 5. *Obeliscus Pamphilius*. 6. *Oedipus Ægyptiacus*, four volumes, folio. 7. *Itinerarium estaticum*. 8. *Obeliscus Ægyptianus*, in four volumes, folio. 9. *Mundus subterraneus*. 10. *China illustrata*.

KIRCHMAN (John), an eminent German divine, was born at Lubec in 1575. He studied in several places of Germany; in 1602 was made professor of poetry at Rostock, and in 1613 rector of the university at Lubec. He exercised this last employment with an extraordinary application during the rest of his life, and died in 1643. He wrote several works; the most esteemed of which are, 1. *De funcribus Romanorum*. 2. *De annulis liber singularis*.

KIRIATHAIM, (anc. geog.), one of the towns built by the Reubenites; reckoned to the tribe of Reuben (Joshua, xiii.), 12 miles to the west of Midaba. The ancient residence of the giants called *Emin*.

KIRIATH ARBA. See HEBRON.

KIRIATH-Baal, or *Cariath-baal*, called also *Kiriath-jearim*, "the city of the woods;" one of the cities of the Gibeonites belonging to the tribe of Judah, nine miles from Aelia, in the road to Diospolis. It was also called *Baala* (Joshua). The ark of the covenant, after its recovery from the Philistines, stood for some time in this city (1 Sam. vii).

KIRK, a Saxon term, signifying the same with church.

*Kirk-Sessions*, the name of a petty ecclesiastical judiciary in Scotland. Each parish, according to its extent, is divided into several particular districts; every one of which has its own elder and deacon to oversee it. A consistory of the ministers, elders, and deacons of a parish, form a *kirk-session*.—These meet once a week, the minister being their moderator, but without a negative voice. It regulates matters relating to public worship, elections, catechising, visitations, &c. It judges in matters of less scandal; but greater, as adultery, are left to the presbytery; and in all cases an appeal lies from it to the presbytery. *Kirk-sessions* have likewise the care of the poor and poor's funds.

KIRKALDY, a town of the county of Fife in Scotland, two miles to the north east of Kynhorn. It is a royal borough, the seat of a presbytery, and gives the title of *baron* to the earl of Melville. The town is populous, well built, and extends a mile in length from east to west, enjoying a tolerable share of trade by exporting its own produce and manufactures of corn, coal, linen, and salt. W. Long 3 0. N. Lat 56. 8.

KIRKBY LONSDALE, a town of Westmoreland, 253 miles from London. It is a large place, with a woollen manufactory, and a market on Tuesday. It has a free school well endowed, with three presentations to Christ's college Cambridge. It has a large church, and a good stone bridge of three arches over the Lon. From its churchyard and the banks of the river, there is a very fine prospect of the mountains at a vast distance, as well as of the course of the river, which abounds with salmon, trout, &c. and provisions of all sorts are very cheap here.

Nº 172.

KIRKBY-Steven, or *Stephen's-Church*, a town of Westmoreland, 257 miles from London, stands on the river Eden near Sedbergh and Algarth. The church is a large building with a lofty tower; in it are several old monuments. Here is a good free school that has two exhibitions. The town is noted for the manufactory of yarn-sockings; and it has a market and a fair.

KIRKBY-Thore, a town of Westmoreland, stands also on the river Eden, north-west of Appleby, 267 miles from London. A horn of a moose-deer was found here a few years since, at the depth of four feet from the surface of the earth; and several other antiquities have been dug up or taken out of a well, discovered at the end of the town near the bridge. Below it are the vast ruins of an ancient town, where Roman coins and urns are frequently dug up. The people call it *Whely-castle*, 300 yards in length, and 150 in breadth, with three entrances on each side, with bulwarks before them. At a little distance from thence Roman urns are found containing bones and ashes. The old military-way runs through it, called the *Maiden way*, because it began at Maiden-castle in Stainmore in Yorkshire, north riding.

KIRKCUDBRIGHT, beginning at the middle of Dumfries-shire in Scotland, makes a considerable part of Galloway, of which the earls of Nithsdale were hereditary stewards. The face of the country exhibits the appearance of one continued heath, producing nothing but pasture for sheep and small black cattle, which are generally sold in England; yet these dusky moors are intersected with pleasant valleys, and adorned with a great number of castles belonging to private gentlemen, every house being surrounded with an agreeable plantation. It is watered by the river Dee; which, taking its rise from the mountains near Carrick, runs through a tract of land about 70 miles in length, and, entering the Irish sea, forms the harbour of Kirkcudbright, a small inconsiderable borough, admirably situated for the fishery and other branches of commerce, which are almost totally neglected through the poverty and indolence of the inhabitants. There is no other town of any consequence in this stewartry. Kirkcudbright gives title of *baron* to the Maclellans, who formerly were a powerful family in the county.

KIRKHAM, a town of Lancashire, 221 miles from London, stands near the Ribble, six miles from the Irish sea, in that part of the county called the *Field-lands*. It has a market and three fairs, and a free school well endowed. By the late inland navigation, it has a communication with the rivers Mersey, Dea, Ribble, Ouse, Trent, Darwent, Severn, Fiumer Thames, Avon, &c. which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, York, Westmoreland, Chester, Warwick, Leicester, Oxford, Worcester, &c.

KIRKOSWALD, a town of Cumberland on the Eden, 291 miles from London. It had formerly a castle, which was demolished above 100 years ago. It has a market and two fairs. Its church is a very irregular old building; and the belfrey is placed distant from the church on the top of an hill, that the sound of the bells might be more easily heard by the circumjacent villages.

KIRK-

**KIRKWALL**, the capital of the Orkneys, situated in the island of Pomona, in W. Long. o. 25. N. Lat. 58. 33. It is built upon an inlet of the sea near the middle of the island, having a very safe road and harbour for shipping. It is a royal borough, governed by a provost, four bailiffs, and a common-council. It was formerly possessed by the Norwegians, who bestowed upon it the name of *Crucoviaca*. From king James III. of Scotland they obtained a new charter empowering them to elect their own magistrates yearly, to hold borough-courts, arrest, imprison, make laws and ordinances for the right government of the town; to have a weekly market, and three fairs annually at certain fixed terms: he moreover granted to them some lands adjoining to the town, with the customs and shore-dues, the power of a pit and gallows, and exempted them from the expence of sending commissioners to parliament. This charter has been confirmed by succeeding monarchs. At present Kirkwall is the seat of justice, where the steward, sheriff, and commissary, hold their several courts of jurisdiction: Here is likewise a public grammar-school, endowed with a competent salary for the master. The town consists of one narrow street about a mile in length; the houses are chiefly covered with slate, though not at all remarkable for neatness and convenience. — The principal edifices are the cathedral church and the bishop's palace. The former, called *St Magnus*, from Magnus king of Norway, the supposed founder of the town, is a large Gothic structure: the roof is supported by 14 pillars on each side, and the spire is built upon four large columns. The gates are decorated with a kind of Mosaic work, of red and white stones elegantly carved and flowered. By the ruins of the king's castle or citadel, it appears to have been a strong and stately fortress. At the north end of the town there is a sort of fortification built by the English in the time of Oliver Cromwell. It is surrounded with a ditch and rampart, and still mounted with some cannon for the defence of the harbour.

**KIRSTENIUS** (Peter), professor of physic at Upsal, and physician-extraordinary to the queen of Sweden, was born at Breslaw in 1577. He studied Greek, Latin, Hebrew, Syriac, natural philosophy, anatomy, botany, and other sciences. Being told that a man could not distinguish himself in physic unless he understood Avicenna, he applied himself to the study of Arabic; and not only to read Avicenna, but also Mesue, Rhasis, Abenzoar, Abukasis, and Averroes. He visited Spain, Italy, England, and did not return home from his travels till after seven years. He was chosen by the magistrates of Breslaw to have the direction of their college and of their schools. A fit of sickness having obliged him to resign that difficult employment, with which he was also much disgusted, he applied himself chiefly to the practice of physic, and went with his family into Prussia. Here he obtained the friendship and esteem of the chancellor Oxenstiern, whom he accompanied into Sweden; where he was made professor of physic in the university of Upsal, and physician to the queen. He died in 1640. It is said in his epitaph, that he understood 26 languages. He wrote many works; among which are, 1. *Liber secundus Canonis Avicenna, typis Arabicis*,

.VOL. IX. Part II.

ex *MSS. editus, et ad verbum in Latinum translatus*, in folio. 2. *De vero usu et abusu Medicinæ*. 3. *Grammatica Arabica*, folio. 4. *Vita quatuor Evangelistarum, ex antiquissimo codice MSS. Arabico eruta*, in folio. 5. *Nota in Evangelium S. Matthæi, ex collatione testuum Arabicorum, Syriacorum, Ægyptiacorum, Græcorum, & Latinorum*, in folio, &c.

He ought not to be confounded with *George Kerslenius*, another learned physician and naturalist, who was born at Stettin, and died in 1660; and also wrote several works which are esteemed.

**KIRTLE**, a term used for a short jacket; also for a quantity of flax about a hundred weight.

**KIRTON**, or **ΚΙΡΚΤΟΝ**, a town of Lincolnshire, 151 miles from London. It had its name from its kirk or church, which is truly magnificent. It has a market and two fairs. This place is famous for the pippin, which, when grafted on its stock, is called the *reunet*. It gives names to its hundreds, in which are four villages of the same name.

**KISSER**, the ancient Colonia Assuras in Africa, as appears from many inscriptions still to be met with in the place. Here is a triumphal arch done in a very good taste: there is also a small temple of a square figure, having several instruments of sacrifice carved upon it; but the execution is much inferior to the design, which is very curious. The town is situated in the kingdom of Tunis, on the declivity of a hill, above a large fertile plain; which is still called the plain of *Surfo*, probably from its ancient name *Assuras*.

**KISSING**, by way of salutation, or as a token of respect, has been practised in all nations. The Roman emperors saluted their principal officers by a kiss. Kissing the mouth or the eyes was the usual compliment upon any promotion or happy event. Soldiers kissed the general's hand when he quitted his office. Fathers, amongst the Romans, had so much delicacy, that they never embraced their wives in the presence of their daughters. Near relations were allowed to kiss their female kindred on the mouth: but this was done in order to know whether they smelt of wine or not; because the Roman ladies, in spite of a prohibition to the contrary, were found sometimes to have made too free with the juice of the grape. Slaves kissed their masters hand, who used to hold it out to them for that purpose. Kissing was a customary mode of salutation amongst the Jews, as we collect from the circumstance of Judas approaching his Master with a kiss. Relations used to kiss their kindred when dying, and when dead; when dying, out of a strange opinion that they should imbibe the departing soul; and when dead, by way of valedictory ceremony. They even kissed the corpse after it was conveyed to the pile, when it had been seven or eight days dead.

**KISTI**, an Asiatic nation, which extends from the highest ridge of Caucasus, along the Sundsha rivulets. According to Major Rennel\*, they are bounded to the west by the little Cabarda, to the east by the Tartars and Lesguis, and to the south by the Lesguis and Georgians. He imagines they may be the people whom Gaerber calls the *Taulinzi*, i. e. "mountaineers," and to whom he attributes the following strange custom:—"When a guest or stranger comes to lodge with them, one of the host's daughters is obliged to

\* *Memoir* of a map of the countries comprehended between the Black Sea and the Caspian.

Kisti.

receive him, to unsaddle and feed his horse, take care of his baggage, prepare his dinner, pass the night with him, and continue at his disposal during his stay. At his departure, she saddles his horse and packs up his baggage. It would be very uncourtly to refuse any of these marks of hospitality." The different tribes of this restless and turbulent nation are generally at variance with each other, and with all their neighbours. Their dialects have no analogy with any known language, and their history and origin are at present utterly unknown.

Their districts, as enumerated in Major Rennel's Memoir, are, 1. Ingushi, about 60 miles to the southward of Mosdok, in the high mountains about the Kumbeleni. 2. Endery; and, 3. Axai, on a low ridge between the Sundsha and Iaxai rivers. In their territories are the hotwells. 4. Ackinyurt, towards the upper part of the Sundsha and Kumbeleni. 5. Ardakli, on the Rosani that joins the Sundsha. 6. Wapi, near the Ossetin village Thim, towards the source of the Terek. 7. Anguht, on the upper part of the Kumbeleni. 8. Shalkha, called by the Russians *Maloï Angust*. 9. Thethen, on the lower part of the Argun river. 10. Atakhi, a small district on the upper part of the Argun. 11. Kulga, or Dhanti, in the high mountains. 12. Galgai, or Halha, about the source of the Afai, a Sundsha rivulet. 13. Thabrilo, and Shabul, on the Sundsha. 14. Thishni-Kabul, on the Rosni, a Sundsha rivulet. 15. Karaboulak, a wandering tribe, who have their little villages about the six uppermost rivulets of the Sundsha, particularly the Fortan. 16. Meesti, Meredhi, Galashka, and Duban, are small tribes on the Axai.

The Ingushi, or first of the above tribes, submitted to Russia in 1770. They are capable of arming about 5000 men; they call themselves *Ingushi*, *Kishi*, or *Halha*; they live in villages near each other, containing about 20 or 30 houses; are diligent husbandmen, and rich in cattle. Many of their villages have a stone tower, which serves in time of war as a retreat to their women and children, and as a magazine for their effects. These people are all armed, and have the custom of wearing shields.—Their religion is very simple, but has some traces of Christianity: They believe in one God, whom they call *Dailé*, but have no saints or religious persons; they celebrate Sunday, not by any religious ceremony, but by resting from labour; they have a fast in spring, and another in summer; they observe no ceremonies either at births or deaths; they allow of polygamy, and eat pork. One kind of sacrifice is usual among them: at certain times a sheep is killed by a person who seems to be considered as a kind of priest, as he is obliged to live in a state of celibacy. His habitation is in the mountains, near an old stone church, which is said to be adorned with various statues and inscriptions. Under the church is a vault that contains certain old books, which, however, no one ever attempts to approach. Mr Guldentaedt † was prevented by the weather from visiting this church.

The 6th, 7th, and 8th tribes, which were formerly tributary to the Cabardean princes, submitted to Russia in 1770. The 9th, Thethen, is governed by its own chiefs, who are related to the Avar-Khan. This tribe is so numerous and warlike, and has given the Russians so much trouble, that its name is usually given

by them to the whole Kisti nation. The chief village of Thethen lies on the Argun, about 15 miles from its mouth. Its other principal villages are Hadshaul and Langejent, both on the Sundsha.

KIT, in music, the name of a small violin of such form and dimension as to be capable of being carried in a case or sheath in the pocket. Its length, measuring from the extremities, is about 16 inches, and that of the bow about 17. Small as this instrument is, its powers are coextensive with those of the violin.

*KIT-Kat Club*, an association of above 30 noblemen and gentlemen of distinguished merit, formed in 1703, purely to unite their zeal in favour of the Protestant succession in the house of Hanover. Their name was derived from Christopher Kat, a pastry-cook, near the tavern where they met in King's-street, Westminster, who often supplied them with tarts. Old Jacob Tonson was their bookseller; and that family is in possession of a picture of the original members of this famous club, painted by Sir Godfrey Kneller. The design of these gentlemen was to recommend and encourage true loyalty by the powerful influence of wit and humour; and Sir Samuel Garth distinguished himself by the extempore epigrams he made on their toasts, which were inscribed on their drinking glasses.

KITCHEN, the room in a house where the provisions are cooked.

*ARMY KITCHEN*, is a space of about 16 or 18 feet diameter, with a ditch surrounding it three feet wide; the opposite bank of which serves as a seat for the men who dress the victuals. The kitchens of the flank companies are contiguous to the outline of the camp; and the intermediate space is generally distributed equally for the remaining kitchens; and as each tent forms a mess, each kitchen must have as many fire-places as there are tents in the company.

*KITCHEN-GARDEN*, a piece of ground laid out for the cultivation of fruit, herbs, pulse, and other vegetables, used in the kitchen.

A kitchen-garden ought to be situated on one side of the house, near the stables, from whence the dung may be easily conveyed into it; and after having built the wall, borders should be made under them; which, according to Miller, ought to be eight or ten feet broad; upon those borders exposed to the south, many sorts of early plants may be sown; and upon those exposed to the north, you may have some late crops, taking care not to plant any sort of deep-rooting plants, especially beans and pease, too near the fruit-trees. You should next proceed to divide the ground into quarters; the best figures for these is a square or an oblong, if the ground will admit of it; otherwise they may be of that shape which will be most advantageous to the ground; the size of these quarters should be proportioned to that of the garden; if they are too small, your ground will be lost in walks, and the quarters being inclosed by espaliers of fruit-trees, the plants will draw up slender, for want of a more open exposure. The walks should also be proportioned to the size of the ground: these in a small garden should be six feet broad, but in a large one ten; and on each side of the walk there should be allowed a border three or four feet wide between it and the espalier; and in these borders may be sown some small salads, or any other herbs that do not take deep root

or continue long; but these quarters should not be sown or planted with the same crop two years together. In one of these quarters, situated nearest to the stables, and best defended from the cold winds, should be the hot-beds, for early cucumbers, melons, &c. and to these there should be a passage from the stables, and a gate through which a small cart may enter. The most important points of general culture consist in well digging and manuring the soil; and giving a proper distance to each plant, according to their different growths: as also in keeping them clear from weeds; for which purpose, you should always observe to keep your dung-hills clear from them, otherwise their seeds will be constantly brought in and spread with the dung.

KITE, in ornithology. See *FALCO*, sp. 8.

KITTIWAKE, in ornithology. See *LARUS*.

KIU-HOA. See *PARTHENIUM*.

KIUN-TCHEOU-FOU. See *HAI-Nan*.

KLEINPOVIA, in botany: A genus of the decandria order, belonging to the gynandria class of plants; and in the natural method ranking under the 37th order, *Columnifera*. The calyx is pentaphyllous; the petals five; the nectarium campanulate and pedunculate, containing the stamina; the capsule is inflated and five-seeded.

KLEIST (Edward Christian de), a celebrated German poet, and a soldier of distinguished bravery, was born at Zeblin, in Pomerania, in 1715. At nine years of age he was sent to pursue his studies at Cron in Poland; and he afterwards studied at Dantzick and Königsberg. Having finished his studies, he went to visit his relations in Denmark, who invited him to settle there; and having in vain endeavoured to obtain preferment in the law, at 21 years of age accepted of a post in the Danish army. He then applied himself to the study of all the sciences that have a relation to military affairs, with the same assiduity as he had before studied civil law. In 1740, at the beginning of the reign of Frederic king of Prussia, Mr de Kleist went to Berlin, and was presented to his majesty, who made him lieutenant of his brother prince Henry's regiment; and he was in all the campaigns which distinguished the five first years of the king of Prussia's reign. In 1749 he obtained the post of captain; and in that year published his excellent poem on the Spring. Before the breaking out of the last war, the king chose him, with some other officers at Potsdam, companion to the young prince Frederic-William of Prussia, and to eat at his table. In the first campaign, in 1756, he was nominated major of Haufen's regiment; which being in garrison at Leipzig, he had time to finish several new poems. After the battle of Rosbach, the king gave him, by an order in his own hand-writing, the inspection of the great hospital established at Leipzig. And on this occasion has humanity was celebrated by the sick and wounded of both parties, and his disinterestedness was equally admired by all the inhabitants of that city. In 1758, Prince Henry coming to Leipzig, Mr Kleist desired to serve in his army with the regiment of Haufen, which was readily granted. Opportunities of distinguishing himself could not be wanting under that great officer, and he always communicated his courage to the battalion under his command. He also

served that prince at the beginning of the campaign of 1759, when he was with him in Franconia, and in all the expeditions of that army, till he was detached with the troops under general de Fink to join the king's army. On the 12th of August was fought the bloody battle of Kunersdorf, in which he fell. He attacked the flank of the Russians, and assisted in gaining three batteries. In these bloody attacks he received twelve contusions; and the two first fingers of his right hand being wounded, he was forced to hold his sword in the left. His post of major obliged him to remain behind the ranks; but he no sooner perceived the commander of the battalion wounded and carried away, than he instantly put himself at the head of his troop. He led his battalion in the midst of the terrible fire of the enemy's artillery, against the fourth battery. He called up the colours of the regiment; and, taking an ensign by the arm, led him on. Here he received a ball in his left arm; when, being no longer able to hold his sword in his left hand, he took it again in the right, and held it with the two last fingers and his thumb. He still pushed forward, and was within thirty steps of the battery, when his right leg was shattered by the wadding of one of the great guns; and he fell from his horse, crying to his men, "My boys, don't abandon your king." By the assistance of those who surrounded him, he endeavoured twice to remount his horse; but his strength forsook him, and he fainted. He was then carried behind the line; where a surgeon, attempting to dress his wounds, was shot dead. The Cossacs arriving soon after, stripped Mr Kleist naked, and threw him into a mirey place; where some Russian hussars found him in the night, and laid him upon some straw near the fire of the grand guard, covered him with a cloak, put a hat on his head, and gave him some bread and water. In the morning one of them offered him a piece of silver, which he refused; on which he tossed it upon the cloak that covered him, and then departed with his companions. Soon after the Cossacs returned, and took all that the generous hussars had given him. Thus he again lay naked on the earth; and in that cruel situation continued till noon, when he was known by a Russian officer, who caused him to be conveyed in a waggon to Frankfort on the Oder; where he arrived in the evening, in a very weak state, and was instantly put into the hands of the surgeons. But the fractured bones separating, broke an artery, and he died by the loss of blood. The city of Frankfort being then in the hands of the enemy, they buried this Prussian hero with all military honours: the governor, a great number of the Russian officers, the magistrates of the city, with the professors and the students, formed the procession, preceded by the funeral music. Mr Kleist's poems, which are greatly admired, are elegantly printed in the German tongue, in 2 volumes 8vo.

KNARESBOROUGH, a town in the West Riding of Yorkshire in England, 199 miles from London, is an ancient borough by prescription, called by foreigners *the Yorkshire Sparu*. It is almost encompassed by the river Nid, which issues from the bottom of Craven-hills; and had a piory, with a castle, long since demolished, on a craggy rock, whence it took the name. The town is about three furlongs in length;

Kleist.  
Knaresborough.

Knapdale  
||  
Knee.

and the parish is famous for four medicinal springs near each other, and yet of different qualities. 1. The sweet spaw, or vitriolic well, in Knareborough forest, three miles from the town, which was discovered in 1620. 2. The stinking, or sulphureous spaw, which is used only in bathing. 3. St Mungo's, a cold-bath, four miles from the town. 4. The dropping-well, which is in the town, and the most noted petrifying spring in England, so called by reason of its dropping from the spongy rock hanging over it. The ground which receives it, before it joins the well, is, for 12 yards long, become a solid rock. From the well it runs into the Nid, where the spring water has made a rock that stretches some yards into the river. The adjacent fields are noted for liquorice, and a soft yellow marle, which is rich manure. The town is governed by a bailiff. Its baths are not so much frequented since Scarborough Spaw came in vogue. It has a good market and six fairs. Here is a stone bridge over the river, near one end of which is a cell dug out of the rock, and called *St Robert's chapel*.

**KNAPDALE**, one of the divisions of Argyleshire in Scotland. It is parted from Cowal on the east by Lochfyn, borders with Kintyre on the south, with Lorn on the north, by Braidalbin on the north-east, and on the west by the Hebrides. Its length from north to south does not exceed 20 miles, and the breadth in some places may amount to 13. It is joined to Kintyre by a neck of land not above a mile broad, over which the country people draw their boats, to avoid sailing round Kintyre. This part of Knapdale abounds with lakes, some of them containing little islands, on which there are castles belonging to different proprietors. The grounds are more adapted for pasturage than grain; but that on the side of Lochow is fruitful in both.

**KNAPSACK**, in a military sense, a rough leather bag which a soldier carries on his back, and which contains all his necessaries. Square knapsacks are most convenient; and should be made with a division to hold the shoes, black-ball and brushes, separate from the linen. White goat-skins are the best.

**KNAVE**, an old Saxon word, which had at first a sense of simplicity and innocence, for it signified a *boy*: Sax. *knapa*, whence a *knave-child*, i. e. a boy, distinguished from a girl, in several old writers; afterwards it was taken for a servant-boy, and at length for any servant-man. Also it was applied to a minister or officer that bore the shield or weapon of his superior; as *field-knapa*, whom the Latins call *armiger*, and the French *escuyer*, 14 Edw. III. c. 3. And it was sometimes of old made use of as a titular addition; as *Johannes C. filius Willielmi C. de Derby, knave*, &c. 22 Hen. VII. c. 37. The word is now perverted to the hardest meaning, viz. a *false deceitful fellow*.

**KNAVESHIP**, in Scots law, one of the names of the small duties payable in thirlage to the miller's servants, called *sequals*.

**KNAUTIA**, in botany: A genus of the monogynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 48th order, *Aggregata*. The common calyx is oblong, simple, quinqueflorous; the proper one simple, superior; the florets irregular; the receptacle naked.

**KNEE**, in anatomy, the articulation of the thigh and leg bones. See **ANATOMY**, n° 59.

**KNEE**, in a ship, a crooked piece of timber, having two branches or arms, and generally used to connect the beams of a ship with her sides or timbers.

The branches of the knees form an angle of greater or smaller extent, according to the mutual situation of the pieces which they are designed to unite. One branch is securely bolted to one of the deck-beams, whilst the other is in the same manner attached to a corresponding timber in the ship's side, as represented by E in the plate of *MIDSHIP-FRAME*.

Besides the great utility of knees in connecting the beams and timbers into one compact frame, they contribute greatly to the strength and solidity of the ship, in the different parts of her frame to which they are bolted; and thereby enable her with greater firmness to resist the effects of a turbulent sea.

In fixing of these pieces, it is occasionally necessary to give an oblique direction to the vertical or side branch, in order to avoid the range of an adjacent gunport, or because the knee may be so shaped as to require this disposition; it being sometimes difficult to procure so great a variety of knees as may be necessary in the construction of a number of ships of war.

In France, the scarcity of these pieces has obliged their ship-wrights frequently to form their knees of iron.

Knees are either said to be *lodging* or *hanging*. The former are fixed horizontally in the ship's frame, having one arm bolted to the beam, and the other across two or three timbers, as represented in the **DECK**, Plate CLVI. The latter are fixed vertically, as we have described above. See also *SHIP-BUILDING*, **DECK**, and *MIDSHIP-FRAME*.

**KNEE of the Head**, a large flat piece of timber, fixed edgewise upon the fore-part of a ship's stem, and supporting the ornamental figure or image placed under the bowsprit. See *SHIP-BUILDING*.

The *knee of the head*, which may properly be defined a continuation of the stem, as being prolonged from the stem forwards, is extremely broad at the upper-part, and accordingly composed of several pieces united into one, YY (*Pieces of the Hull, in SHIP-BUILDING Plates*). It is let into the head, and secured to the ship's bows by strong knees fixed horizontally upon both, and called *the cheeks of the head*. The heel of it is scarfed to the upper-end of the fore foot: and it is fastened to the stem above by a knee, called a *standard*, expressed by & in the plate.

Besides supporting the figure of the head, this piece is otherwise useful, as serving to secure the boom, or bumkin, by which the fore-tack is extended to windward; and by its great breadth, preventing the ship from falling to leeward when close-hauled so much as she would otherwise do. It also affords a greater security to the bowsprit, by increasing the angle of the bob-stay, so as to make it act more perpendicularly on the bowsprit.

The *knee of the head* is a phrase peculiar to ship-wrights; as this piece is always called the *cut-water* by seamen, if we except a few, who, affecting to be wiser than their brethren, have adopted this expression probably on the presumption that the other is a cant-phrase or vulgarism.

**Carling Knees**, in a ship, those timbers which extend from the ship to the hatch-way, and bear up the deck on both sides.

**KNELLER** (Sir Godfrey), a painter, whose fame is well established in these kingdoms. He was born at Lubek in 1648; and received his first instructions in the school of Rembrant, but became afterwards a disciple of Ferdinand Bol. When he had gained as much knowledge as that school afforded him, he travelled to Rome, where he fixed his particular attention on Titian and the Caracci. He afterwards visited Venice, and distinguished himself so effectually in that city by his historical pictures and portraits of the noble families there, that his reputation became considerable in Italy. By the advice of some friends he came at last to England, where it was his good fortune to gain the favour of the duke of Monmouth: by his recommendation, he drew the picture of King Charles II. more than once; who was so taken with his skill in doing it, that he used to come and sit to him at his house in Covent-garden piazza. The Death of Sir Peter Lely left him without a competitor in England, and from that time his fortune and fame were thoroughly established. No painter could have more incessant employment, and no painter could be more distinguished by public honour. He was state-painter to Charles II. James II. William III. Queen Anne, and George I. equally esteemed and respected by them all: the Emperor Leopold made him a knight of the Roman empire, and King George I. created him a baronet. Most of the nobility and gentry had their likenesses taken by him, and no painter excelled him in a sure outline, or in the graceful disposition of his figures: his works were celebrated by the best poets in his time. He built himself an elegant house at Whitton near Hampton-court, where he spent the latter part of his life; and died in 1726.

**KNIFE** is a well-known instrument, made for cutting, and adapted in form to the uses for which it is designed.

Knives are said to have been first made in England in 1563, by one Matthews, on Fleet bridge, London. The importation of all sorts of knives is prohibited.

**KNIGHT** (*eques*), among the Romans, a person of the second degree of nobility, following immediately that of the senators. See *EQUESTRIAN Order*, and *EQUITES*.

**KNIGHT**, or *Cnecht* (Germ), in feudal history, was originally an appellation or title given by the ancient Germans to their youth after being admitted to the privileges of bearing arms.

The passion for arms among the Germanic states, as described by Dr Stuart \*, was carried to extremity. It was amidst scenes of death and peril that the young were educated: It was by valour and feats of prowess that the ambitious signalized their manhood. All the honours they knew were allotted to the brave. The sword opened the path to glory. It was in the field that the ingenious and the noble flattered most their pride, and acquired an ascendancy. The strength of their bodies, and the vigour of their counsels, surrounded them with warriors, and lifted them to command.

But, among these nations, when the individual felt the call of valour, and wished to try his strength against an enemy, he could not of his own authority take the lance and the javelin. The admission of their

youth to the privilege of bearing arms, was a matter of too much importance to be left to chance or their own choice. A form was invented by which they were advanced to that honour.

The council of the district, or of the canton to which the candidate belonged, was assembled. His age and his qualifications were inquired into; and if he was deemed worthy of being admitted to the privileges of a soldier, a chieftain, his father or one of his kindred adorned him with a shield and the lance. In consequence of this solemnity, he prepared to distinguish himself; his mind opened to the cares of the public; and the domestic concerns, or the offices of the family from which he had sprung, were no longer the objects of his attention. To this ceremony, so simple and so interesting, the institution of *knighthood* is indebted for its rise.

Knighthood, however, as a system, known under the denomination of *CHIVALRY*, is to be dated only from the 11th century. All Europe being reduced to a state of anarchy and confusion on the decline of the house of Charlemagne, every proprietor of a manor or lordship became a petty sovereign; the mansion-house was fortified by a moat, defended by a guard, and called a *castle*. The governor had a party of 700 or 800 men at his command; and with these he used frequently to make excursions, which commonly ended in a battle with the lord of some petty state of the same kind, whose castle was then pillaged, and the women and treasures borne off by the conqueror. During this state of universal hostility, there was no friendly communications between the provinces, nor any high roads from one part of the kingdom to another: the wealthy traders, who then travelled from place to place with their merchandise and their families, were in perpetual danger; the lord of almost every castle extorted something from them on the road; and at last, some one more rapacious than the rest, seized upon the whole of the cargo, and bore off the women for his own use.

Thus castles became the warehouses of all kinds of rich merchandise, and the prisons of the distressed females whose fathers or lovers had been plundered or slain, and who being therefore seldom disposed to take the thief or murderer into favour, were in continual danger of a rape.

But as some are always distinguished by virtue in the most general defection, it happened that many lords insensibly associated to repress these sallies of violence and rapine, to secure property, and protect the ladies. Among these were many lords of great fiery; and the association was at length strengthened by a solemn vow, and received the sanction of a religious ceremony. As the first knights were men of the highest rank, and the largest possessions, such having most to lose, and the least temptation to steal, the fraternity was regarded with a kind of reverence, even by those against whom it was formed. Admission into the order was deemed the highest honour; many extraordinary qualifications were required in a candidate, and many new ceremonies were added at his creation. After having fasted from sun-rise, confessed himself, and received the sacrament, he was dressed in a white tunic, and placed by himself at a side-table, where he was neither to speak, to smile, nor to eat; while the knights

Knight.

knights and ladies, who were to perform the principal parts of the ceremony, were eating, drinking, and making merry at the great table. At night his armour was conveyed to the church where the ceremony was performed; and here having watched it till the morning, he advanced with his sword hanging about his neck, and received the benediction of the priest. He then kneeled down before the lady who was to put on his armour, who being assisted by persons of the first rank, buckled on his spurs, put an helmet on his head, and accoutred him with a coat of mail, a cuirass, bracelets, cuisses, and gauntlets.

Being thus armed cap-a-pee, the knight who dubbed him struck him three times over the shoulder with the flat side of his sword, in the name of God, St Michael, and St George. He was then obliged to watch all night in all his armour, with his sword girded, and his lance in his hand. From this time the knight devoted himself to the redress of those wrongs which "patient merit of the unworthy takes;" to secure merchants from the rapacious cruelty of banditti, and women from ravishers, to whose power they were, by the particular confusion of the times, continually exposed.

From this view of the origin of chivalry, it will be easy to account for the castle, the moat, and the bridge, which are found in romances; and as to the dwarf, he was a constant appendage to the rank and fortune of those times, and no castle therefore could be without him. The dwarf and the buffoon were then introduced to kill time, as the card table is at present. It will also be easy to account for the multitude of captive ladies whom the knights, upon seizing a castle, set at liberty; and for the prodigious quantities of useless gold and silver vessels, rich stuffs, and other merchandize, with which many apartments in these castles are said to have been filled.

The principal lords who entered into the confraternity of knights, used to send their sons to each other to be educated, far from their parents, in the mystery of chivalry. These youths, before they arrived at the age of 21, were called *bachelors*, or *bas chevaliers*, inferior knights, and at that age were qualified to receive the order.

So honourable was the origin of an institution, commonly considered as the result of caprice and the source of extravagance; but which, on the contrary, rose naturally from the state of society in those times, and had a very serious effect in refining the manners of the European nations. Valour, humanity, courtesy, justice, honour, were its characteristics: and to these were added religion; which, by infusing a large portion of enthusiastic zeal, carried them all to a romantic excess, wonderfully suited to the genius of the age, and productive of the greatest and most permanent effects both upon policy and manners. War was carried on with less ferocity, when humanity, no less than courage, came to be deemed the ornament of knight-hood, and knighthood a distinction superior to royalty, and an honour which princes were proud to receive from the hands of private gentlemen: more gentle and polished manners were introduced, when courtesy was recommended as the most amiable of knightly virtues, and every knight devoted himself to the service of a lady: violence and oppression decreased, when it was

accounted meritorious to check and to punish them: a scrupulous adherence to truth, with the most religious attention to fulfil every engagement, but particularly those between the sexes as more easily violated, became the distinguishing character of a gentleman, because chivalry was regarded as the school of honour, and inculcated the most delicate sensibility with respect to that point; and valour, seconded by so many motives of love, religion, and virtue, became altogether irresistible.

That the spirit of chivalry sometimes rose to an extravagant height, and had often a pernicious tendency, must however be allowed. In Spain, under the influence of a romantic gallantry, it gave birth to a series of wild adventures which have been deservedly ridiculed: in the train of Norman ambition, it extinguished the liberties of England, and deluged Italy in blood; and at the call of superstition, and as the engine of papal power, it desolated Asia under the banner of the cross. But these ought not to be considered as arguments against an institution laudable in itself, and necessary at the time of its foundation: and those who pretend to despise it, the advocates of ancient barbarism and ancient rufficity, ought to remember, that chivalry not only first taught mankind to carry the civilities of peace into the operations of war, and to mingle politeness with the use of the sword; but roused the soul from its lethargy, invigorated the human character even while it softened it, and produced exploits which antiquity cannot parallel. Nor ought they to forget, that it gave variety, elegance, and pleasure, to the intercourse of life, by making woman a more essential part of society: and is therefore intitled to our gratitude, though the point of honour, and the refinements in gallantry, its more doubtful effects, should be excluded from the improvement of modern manners. For,

To illustrate this topic more particularly, we may observe, that women, among the ancient Greeks and Romans, seem to have been considered merely as objects of sensuality, or of domestic convenience: they were devoted to a state of seclusion and obscurity, had few attentions paid them, and were permitted to take as little share in the conversation as in the general commerce of life. But the northern nations, who paid a kind of devotion to the softer sex, even in their native forests, had no sooner settled themselves in the provinces of the Roman empire, than the female character began to assume new consequence. Those fierce barbarians, who seemed to thirst only for blood, who involved in one undistinguishing ruin the monuments of ancient grandeur and ancient ingenuity, and who devoted to the flames the knowledge of ages, always forbore to offer any violence to the women. They brought along with them the respectful gallantry of the north, which had power even to restrain their savage ferocity; and they introduced into the west of Europe a generosity of sentiment, and a complaisance toward the ladies, to which the most polished nations of antiquity were strangers.—These sentiments of generous gallantry were fostered by the institution of chivalry, which lifted woman yet higher in the scale of life. Instead of being nobody in society, she became *primum mobile*. Every knight devoting himself to danger, declared himself the humble servant of

some

some lady, and that lady was often the object of his love. Her honour was supposed to be intimately connected with his, and her smile was the reward of his valour: for her he attacked, for her he defended, and for her he shed his blood. Courage, animated by so powerful a motive, lost sight of every thing but enterprise: incredible toils were cheerfully endured, incredible actions were performed, and adventures seemingly fabulous were more than realized. The effect was reciprocal. Women, proud of their influence, became worthy of the heroism which they had inspired: they were not to be approached but by the high-minded and the brave; and men then could only be admitted to the bosom of the chaste fair, after proving their fidelity and affection by years of perseverance and of peril.

Again, as to the change which took place in the operations of war, it may be observed, that the perfect hero of antiquity was superior to fear, but he made use of every artifice to annoy his enemy: impelled by animosity and hostile passion, like the savage in the American woods, he was only anxious of attaining his end, without regarding whether fraud or force were the means. But the true knight or modern hero of the middle ages, who seems in all his rencounters to have had his eye on the judicial combat or judgment of God, had an equal contempt for stratagem and danger. He disdained to take advantage of his enemy: he desired only to see him, and to combat him upon equal terms, trusting that heaven would declare in behalf of the just; and as he professed only to vindicate the cause of religion, of injured beauty, or oppressed innocence, he was further confirmed in this enthusiastic opinion by his own heated imagination. Strongly persuaded that the decision must be in his favour, he fought as if under the influence of divine inspiration rather than of military ardour. Thus the system of chivalry, by a singular

combination of manners, blended the heroic and fanciful characters, united devotion and valour, zeal and gallantry, and reconciled the love of God and of the ladies.

Chivalry flourished most during the time of the croisades. From these holy wars it followed, that new fraternities of knighthood were invented: hence the knights of the Holy Sepulchre, the Hospitallers, Templars, and an infinite number of religious orders. Various other orders were at length instituted by sovereign princes: the Garter, by Edward III. of England; the Golden Fleece, by Philip the Good, duke of Burgundy; and St Michael, by Louis XI. of France. From this time ancient chivalry declined to an empty name; when sovereign princes established regular companies in their armies, knights-bannerets were no more, though it was still thought an honour to be dubbed by a great prince or victorious hero; and all who professed arms without knighthood assumed the title of *esquire*.

There is scarce a prince in Europe that has not thought fit to institute an order of knighthood; and the simple title of *knight*, which the kings of Britain confer on private subjects, is a derivation from ancient chivalry, although very remote from its source. See *Knight-BACHELOR*.

*KNIGHT-SERVICE* (*servitium militare*, and in law French *chivalry*); a species of TENURE, the origin and nature of which are explained under the articles CHIVALRY, and FEODAL SYSTEM, n<sup>o</sup> 13—21.

The knights produced by this tenure differed most essentially from the knights described in the preceding article; though the difference seems not to have been accurately attended to by authors (A). The one class of knights was of a high antiquity; the other was not heard of till the invention of a fee. The adorning with arms and the blow of the sword

(A) "The terms *knight* and *chivaler* (Dr Stuart \* observes), denoted both the knight of honour and knight of tenure; and *chivalry* was used to express both *knighthood* and *knight-service*. Hence, it has proceeded, that these persons and these states have been confounded. Yet the marks of their difference are so strong and pointed, that one must wonder that writers should mistake them. It is not, however, mean and common compilers only who have been deceived. Sir Edward Coke, notwithstanding his distinguishing head, is of this number. When estimating the value of the knight's fee at L. 20 *per annum*, he appeals to the statute *de militibus*, an. 1 Ed. II. and, by the sense of his illustration, he conceives, that the knights alluded to there were the same with the possessors of knight's fees: and they, no doubt, had knight's fees; but a knight's fee might be enjoyed not only by the tenants *in capite* of the crown, but by the tenants of a vassal, or by the tenants of a sub-vassal. Now, to these the statute makes no allusion. It did not mean to annex knighthood to every land-holder in the kingdom who had a knight's fee; but to encourage arms, by requiring the tenants *in capite* of the crown to take to them the dignity. He thus confounds *knighthood* and the *knight's fee*. CORE on Littleton, p. 69.

"If I am not deceived, Sir William Blackstone has fallen into the same mistake, and has added to it. Speaking of the knights of honour, or the *equites aurati* from the gilt spurs they wore, he thus expresses himself: 'They are also called, in our law, *milites*, because they formed a part, or indeed the whole, of the royal army, in virtue of their feudal tenures; one condition of which was, that every one who held a knight's fee (which in Henry II.'s time amounted to L. 20 *per annum*), was obliged to be knighted, and attend the king in his wars, or fined for his noncompliance. The exertion of this prerogative, as an expedient to raise money, in the reign of Charles I. gave great offence, though warranted by law, and the recent example of Queen Elizabeth: but it was, at the restoration, together with all other military branches of the feudal law, abolished; and this kind of knighthood has since that time fallen into great disrepute.' Book I. ch. 12.

"After what has been said, I need hardly observe, that this learned and able writer has confounded the knight of honour and the knight of tenure; and that the requisition to take knighthood was not made to every possessor of a knight's fee, but to the tenants of knight's fees held *in capite* of the crown, who had merely a sufficiency

Knight.

word made the act of the creation of the ancient knight; the new knight was constituted by an investment in a piece of land. The former was the member of an order of dignity which had particular privileges and distinctions; the latter was the receiver of a feudal grant. Knighthood was an honour; knight-service a tenure. The first communicated splendor to an army; the last gave it strength and numbers. The knight of honour might serve in any station whatever; the knight of tenure was in the rank of a soldier.—It is true at the same time, that every noble and baron were knights of tenure, as they held their lands by knight-service. But the number of fees they possessed, and their creation into rank, separated them widely from the simple individuals to whom they gave out grants of their lands, and who were merely the knights of tenure. It is no less true, that the sovereign, without conferring nobility, might give even a single fee to a tenant; and such vassals *in capite* of the crown, as well as the vassals of single fees from a subject, were the mere knights of tenure. But the former, in respect of their holding from the crown, were to be called to take upon themselves the knighthood of honour; a condition in which they might rise from the ranks, and be promoted to offices and command. And as to the vassals *in capite* of the crown who had many fees, their wealth of itself sufficiently distinguished them beyond the state of the mere knights of tenure. In fact, they possessed an authority over men who were of this last description; for, in proportion to their lands were the fees they gave out and the knights they commanded.

By the tenure of knight-service, the greatest part of the lands in England were holden, and that principally of the king *in capite*, till the middle of the last century; and which was created, as Sir Edward Coke expressly testifies, for a military purpose, viz. for defence of the realm by the king's own principal subjects, which was judged to be much better than to trust to hirelings or foreigners. The description here given is that of knight-service proper, which was to attend the king in his wars. There were also some other species of knight-service; so called, though improperly, because the service or render was of a free and honourable nature, and equally uncertain as to the time of rendering as that of knight-service proper, and because they were attended with similar fruits and consequences. Such was the tenure by *grand serjeanty*, *per magnum seruitium*, whereby the tenant was bound, instead of serving the king *generally* in his wars, to do some special honorary service to the king in person; as to carry his banner, his sword, or the like; or be his butler, champion, or other officer, at his coronation. It was, in most other respects, like knight-service, only he was not bound to pay aid or escuage; and when tenant by knight-service paid five pounds for a relief on every knight's fee, tenant by grand-

N<sup>o</sup> 172.

serjeanty paid one year's value of his land, were it much or little. Tenure by *cornage*, which was to wind a horn when the Scots or other enemies entered the land, in order to warn the king's subjects, was (like other services of the same nature) a species of grand-serjeanty.

These services, both of chivalry and grand-serjeanty, were all personal, and uncertain as to their quantity or duration. But the personal attendance in knight-service growing troublesome and inconvenient in many respects, the tenants found means of compounding for it, by first sending others in their stead, and in process of time making a pecuniary satisfaction to the lords in lieu of it. This pecuniary satisfaction at last came to be levied by assessments, at so much for every knight's fee; and therefore this kind of tenure was called *scutagium* in Latin, or *seruitium scuti*; *scutum* being then a well-known denomination of money; and in like manner it was called, in our Norman French, *escuage*; being indeed a pecuniary instead of a military service. The first time this appears to have been taken, was in the 5 Hen. II. on account of his expedition to Toulouse; but it soon came to be so universal, that personal attendance fell quite into disuse. Hence we find in our ancient histories, that, from this period when our kings went to war, they levied scutages on their tenants, that is on all the landholders of the kingdom, to defray their expences and to hire troops: and these assessments in the time of Henry II. seem to have been made arbitrarily, and at the king's pleasure. Which prerogative being greatly abused by his successors, it became matter of national clamour; and King John was obliged to consent, by his *magna carta*, that no scutage should be imposed without consent of parliament. But this clause was omitted in his son Henry III.'s charter; where we only find, that scutages or escuage should be taken as they were used to be taken in the time of Henry II.; that is, in a reasonable and moderate manner. Yet afterwards, by statute 25 Edw. I. c. 5. & 6. and many subsequent statutes, it was enacted, that the king should take no aids or taxes but by the common assent of the realm. Hence it is held in our old books, that escuage or scutage could not be levied but by consent of parliament; such scutages being indeed the groundwork of all succeeding subsidies, and the land-tax of later times.

Since, therefore, escuage differed from knight-service in nothing but as a compensation differs from actual service, knight-service is frequently confounded with it. And thus Littleton must be understood, when he tells us, that tenant by homage, fealty, and escuage, was tenant by knight-service: that is, that this tenure (being subservient to the military policy of the nation) was respected as a tenure in chivalry. But as the actual service was uncertain, and depended upon emergencies, so it was necessary that this pecuniary com-

sufficiency to maintain the dignity, and were thence disposed not to take it. The idea that the whole force of the royal army consisted of knights of honour, or dubbed knights, is so extraordinary a circumstance, that it might have shown of itself to this eminent writer the source of his error. Had every soldier in the feudal army received the investiture of arms? could he wear a seal, surpass in silk and dress, use ensigns-armorial, and enjoy all the other privileges of knighthood? But, while I hazard these remarks, my reader will observe, that it is with the greatest deference I dissent from Sir William Blackstone, whose abilities are the object of a most general and deserved admiration."

compensation should be equally uncertain, and depend on the assessments of the legislature suited to those emergencies. For had the escuage been a settled invariable sum, payable at certain times, it had been neither more nor less than a mere pecuniary rent; and the tenure, instead of knight service, would have then been of another kind, called *SOCAGE*.

By the degenerating of knight-service, or personal military duty, into escuage or pecuniary assessments, all the advantages (either promised or real) of the feudal constitutions were destroyed, and nothing but the hardships remained. Instead of forming a national militia composed of barons, knights, and gentlemen, bound by their interest, their honour, and their oaths, to defend their king and country, the whole of this system of tenures now tended to nothing else but a wretched means of raising money to pay an army of occasional mercenaries. In the mean time the families of all our nobility and gentry groaned under the intolerable burdens which (in consequence of the fiction adopted after the conquest) were introduced and laid upon them by the subtlety and finesse of the Norman lawyers. For, besides the feutages to which they were liable in defect of personal attendance, which, however, were assailed by themselves in parliament, they might be called upon by the king or lord paramount for *aids*, whenever his eldest son was to be knighted, or his eldest daughter married; not to forget the ransom of his own person. The heir, on the death of his ancestor, if of full age, was plundered of the first emoluments arising from his inheritance, by way of *relief* and *primer seisin*; and if under age, of the whole of his estate during infancy. And then, as Sir Thomas Smith very feelingly complains, "when he came to his own, after he was out of *wardship*, his woods decayed, houses fallen down, stock wasted and gone, lands let forth and ploughed to be barren," to make amends, he was yet to pay half a year's profits as a fine for suing out his *livery*; and also the price or value of his *marriage*, if he refused such wife as his lord and guardian had bartered for, and imposed upon him; or twice that value, if he married another woman. Add to this, the untimely and expensive honour of *knighthood*, to make his poverty more completely splendid. And when, by these deductions, his fortune was so shattered and ruined, that perhaps he was obliged to sell his patrimony, he had not even that poor privilege allowed him, without paying an exorbitant fine for a *licence of alienation*.

A slavery so complicated and so extensive as this, called aloud for a remedy in a nation that boasted of her freedom. Palliatives were from time to time applied by successive acts of parliament, which assuaged some temporary grievances. Till at length the humanity of King James I. consented, for a proper equivalent, to abolish them all, though the plan then proceeded not to effect; in like manner as he had formed a scheme, and began to put it in execution, for removing the feudal-grievance of heritable jurisdictions in Scotland, which has since been pursued and effected by the statute 20 Geo. II. c. 43. King James's plan for exchanging our military tenures seems to have been nearly the same as that which has been since pursued; only with this difference, that by way of compensation for the loss which the crown and other lords

would sustain, an annual fee-farm rent should be settled and inseparably annexed to the crown, and assured to the inferior lords, payable out of every knight's fee within their respective feignories. An expedient, seemingly much better than the hereditary excise which was afterwards made the principal equivalent for these concessions. For at length the military tenures, with all their heavy appendages, were destroyed at one blow by the statute 12 Car. II. c. 24, which enacts, "that the court of ward or liveries, and all wardships, liveries, primer seisons, and ousterlemains, values and forfeitures of marriages by reason of any tenure of the king or others, be totally taken away. And that all fines for alienations, tenures by homage, knights-service, and escuage, and also aids for marrying the daughter or knighting the son, and all tenures of the king *in capite*, be likewise taken away. And that all sorts of tenures, held of the king or others, be turned into free and common socage; save only tenures in frankalmoin, copyholds, and the honorary services (without the slavish part) of grand-ferjeanty." A statute which was a greater acquisition to the civil property of this kingdom than even *magna carta* itself: since that only pruned the luxuriances that had grown out of the military tenures, and thereby preserved them in vigour; but the statute of King Charles extirpated the whole, and demolished both root and branches.

*Knights-Errent.* During the prevalence of chivalry, the ardour of redressing wrongs seized many knights so powerfully, that, attended by esquires, they wandered about in search of objects whose misfortunes and misery required their assistance and succour. And as ladies engaged more particularly their attention, the relief of unfortunate damfels was the achievement they most courted. This was the rise of knights-errant, whose adventures produced romance. These were originally told as they happened. But the love of the marvellous came to interfere; fancy was indulged in her wildest exaggerations; and poetry gave her chains to the most monstrous fictions, and to scenes the most unnatural and gigantic. See KNIGHT.

*KNIGHT-Bachelor.* See BACHELOR.

*KNIGHT-Baronet.* See BARONET.

*KNIGHTS of the Shire, or Knights of Parliament,* are two gentlemen of worth, chosen on the king's writ in *pleno comitatu*, by such of the freeholders of every county as can expend 40 s. *per annum*, to represent such county in parliament. These, when every man who held a knights-fee *in capite* of the crown was customarily constrained to be a knight, were of necessity to be *milites gladio civili*, for so the writ runs to this day; but now custom admits esquires to be chosen to this office. They must have at least 500 l. *per annum*; and their expences are to be defrayed by the county, though this be seldom now required.

*KNIGHT-Marshal,* an officer in the king's household, who has jurisdiction and cognizance of any transgression within the king's household and verge; as also of contracts made there, whereof one of the house is party.

KNIGHTS, in a ship, two short thick pieces of wood, commonly carved like a man's head, having four shivers in each, three for the halyards, and one for the

**Knighthood, Knightlow.** top to run in: one of them stands fast bolted on the beams abaft the foremast, and is therefore called the *fore-knight*; and the other, standing abaft the mainmast, is called the *main knight*.

**KNIGHTHOOD**, a military order or honour, or a mark or degree of ancient nobility, or reward of personal virtue and merit.

There are four kinds of knighthood; military, regular, honorary, and social.

*Military KNIGHTHOOD*, is that of the ancient knights, who acquired it by high feats of arms. They are called *milites*, in ancient charters and titles, by which they were distinguished from mere bachelors, &c. These knights were girt with a sword, and a pair of gilt spurs; whence they were called *equites aurati*.

Knighthood is not hereditary, but acquired. It does not come into the world with a man like nobility; nor can it be revoked. The sons of kings, and kings themselves, with all other sovereigns, heretofore had knighthood conferred on them as a mark of honour. They were usually knighted at their baptism or marriage, at their coronation, before or after a battle, &c.

*Regular KNIGHTHOOD*, is applied to all military orders which profess to wear some particular habit, to bear arms against the infidels, to succour and assist pilgrims in their passage to the Holy Land, and to serve in hospitals where they should be received; such were the knights templars, and such still are the knights of Malta, &c.

*Honorary KNIGHTHOOD*, is that which princes confer on other princes, and even on their own great ministers and favourites; such are knights of the Garter, Bath, St Patrick, Nova Scotia, Thistle, &c. See these articles; and for a representation of their different insignia, see Plate CCLVIII.

*Social KNIGHTHOOD*, is that which is not fixed nor confirmed by any formal institution, nor regulated by any lasting statutes; of which kind there have many orders been erected on occasion of factions, of tilts and tournaments, masquerades, and the like.

The abbot Bernardo Justiniani, at the beginning of his History of Knighthood, gives us a complete catalogue of the several orders: according to this computation, they are in number 92. Favin has given us two volumes of them under the title of *Theatre d'Honneur & de Chevalerie*. Menenius has published *Deliciae Equestrium Ordinum*, and Andr. Mendo has written *De Ordinibus Militaribus*. Beloi has traced their original; and Geliot, in his Armorial Index, has given us their institutions. To these may be added, Father Menestrier de la Chevalerie Ancienne & Moderne. Michieli's *Tresor Militaire*, Cavanius's *Theologia Regolare*, Miræus's *Origines Equestrium sive Militarum Ordinum*: but above all, Justinian's *Historie Chronologique dell'Origine de gl'Ordine Militari, e di tutte le Religione Cavaleresche*; the edition which is fullest is that of Venice in 1692, in two vols fol.

**KNIGHTLOW HILL**, or **CROSS**, which gives name to a hamlet in Warwickshire, stands in the road from Coventry to London, at the entrance of Duntmore-Heath. About 40 towns in this hamlet, which are specified by Dugdale, are obliged, on the forfeiture of 30 s. and a white bull, to pay a certain rent to the lord of the hamlet, called *wroth-money*, or *swarf-penny*; which must

be deposited every Martinmas-day in the morning at this cross before sun-rise; when the party paying it must go thrice about the cross, and say the wroth-money, and then lay it in the hole of the said cross before good witness.

**KNIGHTON**, a well built town of Radnorshire in South Wales, 155 miles from London. It is pleasantly situated on an elevation rising from a small river, which divided this part of Wales from Shropshire. It carries on a considerable trade, and has a market and a fair.

**KNIGHTSBRIDGE**, a village of Middlesex, and the first village from London in the great western road. It lies in the parishes of St Margaret's Westminster, and St George by Humber-Square; and has a chapel, which is nevertheless independent. At the entrance of it from London stands that noble infirmary for sick and wounded, called *St George's Hospital*, erected and maintained by the contributions of our nobility and gentry, of whom there are no less than 300 governors. In the centre of this village, there is a fabric lately erected, where is carried on one of the most considerable manufactures in England for painting floor-cloths, &c.

**KNOCTOPHER**, a borough and market town of Ireland in the county of Kilkenny and province of Leinster, 63 miles from Dublin. It returns two members to parliament; patronage in the families of Langrishe and Ponsonby.

**KNOLL**, a term used in many parts of the kingdom for the top of a small hill, or for the hill itself.

**KNOLLES** (Richard), was born in Northamptonshire, about the middle of the 16th century, and educated at Oxford, after which he was appointed master of the free-school at Sandwich in Kent. He composed *Grammaticæ Latine, Græcæ, et Hebraicæ, compendium, cum radicibus*, London 1606; and sent a great number of well grounded scholars to the universities. He also spent 12 years in compiling a history of the Turks; which was first printed in 1610, and by which he has perpetuated his name. In the later editions it is called, *The general history of the Turks, from the first beginning of that nation to the rising of the Ottoman family*, &c. He died in 1610, and this history has been since continued by several hands: the best continuation is that by Paul Ricaut consul at Smyrna, folio, London 1680. Knolles wrote also, "The lives and conquests of the Ottoman kings and emperors to the year 1610;" which was not printed till after his death in 1621, to which time it was continued by another hand; and lastly, "A brief discourse of the greatness of the Turkish empire, and wherein the greatness of the strength thereof consisteth, &c."

**KNOT**, a part of a tree, from which shoots out branches, roots, or even fruit. The use of the knots is, to strengthen the stem; they serve also as scarves, to filtrate, purify, and refine the juices raised up for the nourishment of the plant.

**KNOTS of a Rope**, among seamen, are distinguished into three kinds, viz. whole-knot, that made so with the lays of a rope that it cannot slip, serving for sheets, tacks, and stoppers: bow-line knot, that so firmly made and fastened to the cringles of the sails, that they must break or the sail split before it slips: and

and sheep-shank knot, that made by shortening a rope without cutting it, which may be presently loosened, and the rope not the worse for it.

*Knots of the Log-line*, at sea, are the divisions of it. See the article *LOG*.

**KNOT**, in ornithology. See *TRINGA*.

*KNOT-Grass*, or *Bilfort*. See *POLYGONUM*.

**KNOT** (Edward), born in Northumberland in England, entered among the Jesuits at the age of 26, being already in priest's orders. This happened in the year 1606. He taught a long time at Rome in the English college; and was afterwards appointed sub-provincial of the college of England, and was sent provincial thither. He was twice honoured with that employment. He was present as provincial at the general assembly of the order of the Jesuits held at Rome in 1646, and was chosen definitor. He died in 1696. He published several pieces; among the rest, *Mersey and Truth*, or *Charity maintained by the Catholics*; against Dr Potter, who had charged the church of Rome with wanting charity, because she asserts that a man cannot be saved in the Protestant communion.

**KNOTTESFORD**, a town of Cheshire, near the Mersey, 184 miles from London, is divided into the upper and lower towns by a rivulet called *Bicken*. In the former is the church; and in the latter is a chapel of ease, the market and town house. It has a market and three fairs.

**KNOTTINGLEY**, a town in the west riding of Yorkshire, on the Aire near Ferrybridge, is noted for its merchandize in lime. The stones of which it is made are dug up plentifully at Elmet, and here burnt; from whence it is conveyed at certain seasons in great quantities to Wakefield, Sandal, and Standbridge, for sale, and so carried into the western parts of the county for manure.

**KNOUT**, the name of a punishment inflicted in Russia, with a kind of whip called *knout*, and made of a long strap of leather prepared for this purpose. With this whip the executioners dexterously carry off a slip of skin from the neck to the bottom of the back laid bare to the waist, and repeating their blows, in a little while rend away all the skin off the back in parallel strips. In the common knout the criminal receives the lashes suspended on the back of one of the executioners: but in the great knout, which is generally used on the same occasions as racking on the wheel in France, the criminal is raised into the air by means of a pulley fixed to the gallows, and a cord fastened to the two wrills tied together; a piece of wood is placed between his two legs also tied together; and another of a crucial form under his breast. Some times his hands are tied behind over his back; and when he is pulled up in this position, his shoulders are dislocated. The executioners can make, this punishment more or less cruel: and it is said, are so dexterous, that when a criminal is condemned to die, they can make him expire at pleasure either by one or several lashes.

**KNOWLEDGE**, is defined by Mr Locke to be the perception of the connection and agreement or disagreement and repugnancy of our ideas. See *METAPHYSICS* and *LOGIC*.

**KNOX** (John), the hero of the reformation in Scotland, was born in 1505, at Gifford near Haddington in East Lothian; and educated at the university of

St Andrew's, where he took a degree in arts, and commenced teacher very early in life. At this time the new religion of Martin Luther was but little known in Scotland: Mr Knox therefore at first was a zealous Roman-catholic: but attending the sermons of a certain black friar, named *Guilliam*, he began to waver in his opinions; and afterwards conversing with the famous Wishart, who in 1544 came to Scotland with the commissioners sent by Henry VIII. he renounced the Romish religion, and became a zealous reformer. Being appointed tutor to the sons of the lairds of Ormskoun and Langniddery, he began to instruct them in the principles of the Protestant religion; and on that account was so violently persecuted by the bishop of St Andrew's, that with his two pupils he was obliged in the year 1547 to take shelter in the castle of that place. But the castle was besieged and taken by 21 French galleys. He continued a prisoner on board a galley two years, namely, till the latter end of the year 1549; when being set at liberty, he landed in England, and having obtained a licence, was appointed preacher, first at Berwick, and afterwards at Newcastle. Strype conjectures that in 1552 he was appointed chaplain to Edward VI. He certainly obtained an annual pension of 40 l. and was offered the living of All-hallows in London; which he refused, not choosing to conform to the liturgy.

Soon after the accession of Queen Mary, he retired to Geneva; whence, at the command of John Calvin, he removed to Francfort, where he preached to the exiles: but a difference arising on account of his refusing to read the English liturgy, he went back to Geneva; and from thence in 1555 returned to Scotland, where the reformation had made considerable progress during his absence. He now travelled from place to place, preaching and exhorting the people with unremitting zeal and resolution. About this time (1556), he wrote a letter to the queen regent, earnestly intreating her to hear the Protestant doctrine; which letter she treated with contempt. In the same year the English Calvinists at Geneva invited Mr Knox to reside among them. He accepted their invitation. Immediately after his departure from Scotland, the bishop summoned him to appear, and he not appearing, condemned him to death for heresy, and burnt his effigy at the cross of Edinburgh.

Our reformer continued abroad till the year 1559, during which time he published his "First blatt against the monstrous regiment of women." Being now returned to Scotland, he resumed the great work of reformation with his usual ardour, and was appointed minister at Edinburgh. In 1561 Queen Mary arrived from France. She, it is well known, was bigotted to the religion in which she had been educated; and on that account was exposed to continual insults from her reformed subjects. Mr Knox himself frequently insulted her from the pulpit; and when admitted to her presence, regardless of her sex, her beauty, and her high rank, behaved to her with a most unjustifiable freedom. In the year 1571 our reformer was obliged to leave Edinburgh, on account of the confusion and danger from the opposition to the earl of Lenox, then regent; but he returned the following year, and resumed his pastoral functions. He died at Edinburgh in November 1572, and was buried in the church-yard

Knox  
||  
Knutzen.

of St Giles's in that city.—His History of the Reformation was printed with his other works at Edinburgh in 1584, 1586, 1644, 1732. He published many other pieces; and several more are preserved in Calderwood's History of the Church of Scotland. He left also a considerable number of manuscripts, which in 1732 were in the possession of Mr Woodrow, minister of Eastwood.

As to his character, it is easily understood, notwithstanding the extreme dissimilitude of the two portraits drawn by Popish and Calvinistical pencils. According to the first, he was a devil; in the ideas of the latter, an angel. He was certainly neither. The following character is drawn by Dr Robertson. "Zeal, intrepidity, disinterestedness, were virtues that he possessed in an eminent degree. He was acquainted too with the learning cultivated in that age; and excelled in that species of eloquence which is calculated to rouse and to inflame. His maxims, however, were often too severe, and the impetuosity of his temper excessive. Rigid and uncompromising, he showed no indulgence to the infirmities of others. Regardless of the distinctions of rank and character, he uttered his admonitions with an acrimony and vehemence more apt to irritate than to reclaim; and this often betrayed him into indecent expressions, with respect to Queen Mary's person and conduct. Those very qualities, however, which now render his character less amiable, fitted him to be the instrument of Providence for advancing the reformation among a fierce people, and enabled him to face dangers, and to surmount opposition, from which a person of a more gentle spirit would have been apt to shrink back. By an unwearied application to study and to business, as well as by the frequency and fervour of his public discourses, he had worn out a constitution naturally strong. During a lingering illness, he discovered the utmost fortitude; and met the approach of death with a magnanimity inseparable from his character. He was constantly employed in acts of devotion, and comforted himself with those prospects of immortality, which not only preserve good men from desponding, but fill them with exultation in their last moments. The earl of Morton, who was present at his funeral, pronounced his eulogium in a few words, the more honourable for Knox, as they came from one whom he had often censured with peculiar severity; "Here lies he who never feared the face of man."

**KNOXIA**, in botany: A genus of the monogynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 47th order, *Stellate*. The corolla is monopetalous, and funnel-shaped; there are two furrowed seeds; the calyx has one leaf larger than the rest.

**KNUTZEN** (Matthias), a native of Holstein, the only person on record who openly professed and taught atheism. It is said he had about 1000 disciples in different parts of Germany. They were called *Conscientiaris*, because they asserted there is no other God, no other religion, no other lawful magistracy, but conscience, which teaches every man the three fundamental principles of the law of nature:—To hurt nobody, to live honestly, and to give every one his due. Several copies of a letter of his from Rome were spread abroad, containing the substance of his

system. It is to be found entire in the last edition of Micraelius.

**KOEDOE**. See **CAPRA**.

**KOEI-TCHOU**, a province of China, and one of the smallest in the kingdom. On the south it has Quang-si, on the east Hou-quang, on the north Setchen, and Yun-nan on the west. The whole country is almost a desert, and covered with inaccessible mountains: it may justly be called the *Siberia* of China. The people who inhabit it are mountaineers, accustomed to independence, and who seem to form a separate nation: they are no less ferocious than the savage animals among which they live.—The mandarins and governors who are sent to this province are sometimes disgraced noblemen, whom the emperor does not think proper to discard entirely, either on account of their alliances, or the services which they have rendered to the state: numerous garrisons are entrusted to their charge, to over-awe the inhabitants of the country; but these troops are found insufficient, and the court despairs of being ever able thoroughly to subdue these untractable mountaineers.—Frequent attempts have been made to reduce them to obedience, and new forts have from time to time been erected in their country; but the people, who are not ignorant of those designs, keep themselves shut up among their mountains, and seldom issue forth but to destroy the Chinese works or ravage their lands.—Neither silks nor cotton cloths are manufactured in this province; but it produces a certain herb much resembling our hemp, the cloth made of which is used for summer dresses. Mines of gold, silver, quicksilver, and copper, are found here; of the last metal, those small pieces of money are made which are in common circulation throughout the empire.—Koei-tcheou contains 10 cities of the first class, and 38 of the second and third.

**KOEMPFER** (Engelbert), was born in 1651 at Lemgow in Westphalia. After studying in several towns, he went to Dantzick, where he gave the first public specimen of his proficiency by a dissertation *De majestatis divissione*. He then went to Thorn; and from thence to the university of Cracow, where he took his degree of doctor in philosophy; after which he went to Koningberg in Prussia, and staid there four years. He next travelled into Sweden, where he soon began to make a figure, and was appointed secretary of the embassy to the sophi of Persia. He set out from Stockholm with the presents for that emperor; and went through Aaland, Finland, and Ingermanland, to Narva, where he met Mr Fabricius the ambassador, who had been ordered to take Moscow in his way. The ambassador having ended his negotiations at the Russian court, set out for Persia. During their stay, two years, at Ispahan, Dr Kœmpfer, whose curious and inquisitive disposition suffered nothing to escape him unobserved, made all the advantages possible of so long an abode in the capital of the Persian empire. The ambassador, towards the close of 1685, preparing to return into Europe, Dr Kœmpfer chose rather to enter into the service of the Dutch East India company, in quality of chief surgeon to the fleet, then cruising in the Persian Gulph. He went aboard the fleet, which, after touching at many Dutch settlements, came to Batavia in September 1689. Dr Kœmpfer here

here applied himself chiefly to natural history. Hence he set out for Japan, in quality of physician to the embassy which the Dutch East India company sends once a year to the Japanese court. He quitted Japan to return to Europe in 1692. In 1694 he took his degree of doctor of physic at Leyden; on which occasion he communicated, in what are called *Inaugural Theses*, ten very singular and curious observations made by him in foreign countries. He intended to digest his memoirs into proper order; but was prevented, by being made physician to the count de Lippe. He died in 1716. His principal works are, 1. *Amanites Esotice*, in 4to; a work which includes many curious and useful particulars in relation to the civil and natural history of the countries through which he passed. 2. *Herbarium Ultra-Gingeticum*. 3. The history of Japan, in German, which is very curious and much esteemed; and for which the public is indebted to the late Sir Hans Sloane, who purchased for a considerable sum of money all our author's curiosities, both natural and artificial, as likewise all his drawings and manuscript memoirs, and prevailed with the late learned Dr Scheuchzer to translate the Japanese history into English.

· KÆMPFERIA. See KEMPFERIA.

KOENIG (Samuel), a learned philosopher and mathematician, was professor of philosophy at Francker, and afterwards at the Hague, where he became librarian to the Stadtholder, and died there in 1757. He wrote several works which are esteemed.

KOENIGIA, in botany; a genus of the trigynia order, belonging to the triandria class of plants. The calyx is triphyllous; there is no corolla; and but one ovate and naked seed.

KONGSBERG, a town of Norway, belonging to Denmark, and celebrated for its silver mines, whose produce has been considerably exaggerated by most of the travellers that have published on this subject. The town, which stretches on both sides the river Lowe, contains about 1000 houses, and including the miners 6000 inhabitants. The mines, which lie about two miles from the town, were first discovered and worked during the reign of Christian IV.; and of their present state the following account is given by Mr Coxæ†. There are 36 mines now working; the deepest whereof called *Segen-Gottes in der North*, is 652 feet perpendicular. The matrix of the ore is the faxum of Linnæus. The silver is extracted according to the usual process, either by smelting the ore with lead or by pounding. The pure silver is occasionally found in small grains and in small pieces of different sizes, seldom weighing more than four or five pounds. Sometimes, indeed, but extremely rare, masses of a considerable bulk have been discovered; and one in particular which weighed 409 marks, and was worth 3000 rix-dollars, or 600l. This piece is still preserved in the cabinet of curiosities at Copenhagen. Formerly these mines produced annually 350,000 rix-dollars, or 70,000l.; and in 1769, even 79,000l.; at present they seldom yield only from 50,000l. to 54,000l. Formerly above 4000 men were necessary for working the mines, smelting and preparing the ore; but a few years ago 2400 miners were removed to the cobalt works lately established at Fossun and to other mines, and the number is now reduced to 2500. By these

and other reductions, the expence, which was before estimated at 5750l. per month, now amounts to only 4400l. or about 52,800l. per annum. Yet even with this diminution the expences generally equal, and sometimes exceed, the profits. Government, therefore, draws no other advantage from these mines, than by giving employment to so many persons, who would be otherwise incapable of gaining their livelihood, and by receiving a certain quantity of specie, which is much wanted in the present exhausted state of the finances in Denmark. For such is the deficiency of specie, that even at Kongberg itself change for a bank note is with difficulty obtained. The miners are paid in small bank notes, and the whole expences are defrayed in paper currency. The value of 13,000 rix-dollars, or 2600l. in block silver is annually sent to Copenhagen; the remainder of the ore is coined in the mint of Kongberg, and transferred to Copenhagen. The largest piece of money now struck at Kongberg is only eight skillings or four pence.

KONIG (George Matthias), a learned German, born at Altorf in Franconia in 1616. He became professor of poetry and of the Greek tongue there, and librarian to the university; in which last office he succeeded his father. He gave several public specimens of his learning; but is principally known for a Biographical Dictionary, intitled, *Bibliotheca vetus et nova*, 4to, Altorf, 1674: which, though it is very defective, is useful to biographers. He died in 1699.

KONIG (Emanuel), a learned physician of Basil, born in that city in 1658, whose medicinal works were so esteemed in Switzerland, that he was considered as a second Avicenna. He died at Basil in 1731.

KONINGSBERG, a town of Poland, and capital of Regal Prussia, with a magnificent palace, in which is a hall 274 feet long and 59 broad without pillars to support it, and a handsome library. It is about five miles in circumference; and including the garrison of 7000 men contains 60,000 inhabitants. The town-house, the exchange, and the cathedral church, are all very fine structures. The tower of the castle is exceeding high; and has 284 steps to go to the top, from whence there is a very distant prospect. There are 18 churches in all; of which 14 belong to the Lutherans, three to the Calvinists, and one to the Papists. It stands on the Pregel, a navigable river which flows from the north-western provinces of Poland, and here falls into the eastern extremity of the Fische Haf, an inlet of the Baltic. No ships drawing more than seven feet water can pass the bar and come up to the town; so that the large vessels anchor at Pillau, a small town on the Baltic, which is the port of Konigsberg; and the merchandise is sent in smaller vessels to this place. Its trade is very considerable.—Konigsberg contains an university founded by Albert of Brandenburg. According to the original endowment there were 40 professors; but their number is now reduced to 16. Each professor receives a salary of about 50l. per annum, which may be increased by private lectures. In 1775, the university contained 800 students, of whom 200 are lodged and boarded at the expence of the crown. There are three public libraries in the town, the royal or university library, the town library, and the *Wallenrodt library*, so called because it was given by Martien von Wallenrodt, in 1650. E. L. 21. 35. N. L. 54. 43.

**KORAN**, or **ALCORAN**. See **ALCORAN** and **MAGOMETANISM**.

**KOREKI**, the country of the **Koriacs**. See the next article.

**KORIACS**, a people inhabiting the northern part of **Kamtschatka**, and all the coast of the Eastern Ocean from thence to the **Anadir**.—They are divided into the **Rein-deer** or **Wandering Koriacs**, and the **Fixed Koriacs**. The former lead an erratic life, in the tract bounded by the **Penshinska** sea to the south-east, the river **Kowyma** to the west, and the river **Anadir** to the north. They wander from place to place with their rein-deer, in search of the moss, the food of those animals, which are their only wealth. They are squalid, cruel, and warlike; the terror of the **Fixed Koriacs** as much as the **Tchutski** are of them. They never frequent the sea, nor live on fish. Their habitations are jourts, or places half sunk in the earth; and they never use **balagans** or summer-houses elevated on posts like the **Kamtschatkans**. They are in their persons lean, and very short; have small heads and black hair, which they shave frequently: their faces are oval; their nose is short; their eyes are small; their mouth is large; and their beard black and pointed, but often eradicated.—The **fixed Koriacs** are likewise short; but rather taller than the others, and strongly made: the **Anadir** is also their boundary to the north, the ocean to the east, and the **Kamtschatkans** to the south. They have few rein-deer, which they use in their sledges; but neither of the tribes of **Koriacs** are civilized enough to apply them to the purposes of the dairy. Each speak a different dialect of the same language: but the **Fixed** in most things resemble the **Kamtschatkans**; and, like them, live almost entirely on fish. They are timid to a high degree, and behave to their wandering brethren with the utmost submission; who call them by a name which signifies *their slaves*. These poor people seem to have no alternative; for, by reason of the scarcity of rein-deer, they depend on these tyrants for the essential article of cloathing—These two nations Mr **Pennant** supposes, from their features, to be the offspring of **Tatars**, which have spread to the east, and degenerated in size and strength by the rigour of the climate, and often by scarcity of food.

**KOS**, in Jewish antiquity, a measure of capacity, containing about four cubic inches: this was the cup of blessing out of which they drank when they gave thanks after solemn meals, like that of the **passover**.

**KOTTERUS** (**Christoph**), was one of the three fanatics whose visions were published at **Amsterdam** in 1657, with the title of *Lux in tenebris*. He lived at **Sprotta** in **Silesia**, and his visions began in 1616. He fancied he saw an angel under the form of a man, who commanded him to go and declare to the magistrates, that, unless the people repented, the wrath of God would make dreadful havoc. The elector palatine, whom the Protestants had declared king of **Bohemia**, was introduced in these visions. **Kotterus** waited on him at **Breslaw** in December 1620, and informed him of his commission. He went to several other places, and at last to the court of **Brandenburg**. As most of these predictions promised felicity to the elector palatine, and unhappiness to his imperial majesty, the emperor's fiscal in **Silesia** and **Lusatia** got

him seized, set on the pillory, and banished the emperor's dominions. Upon this he went to **Lusatia**, and there lived unmolested till his death, which happened in 1647.

**KOU-CHU**, a Chinese shrub, which bears a great resemblance to the fig-tree both in the make of its branches and the form of its leaves. From its root several twigs or shoots generally spring up, which form a kind of bush; but sometimes it consists of only one shoot. The wood of the branches of the **kou-chu** is soft and spongy, and covered with bark like that of the fig-tree. Its leaves are deeply indented, and their colour and the texture of their fibres are exactly the same as those of the fig-tree; but they are larger and thicker, and much rougher to the touch.

This tree yields a kind of milky juice, which the Chinese use for laying on gold-leaf in gilding. They make one or more incisions in the trunk, into which they insert the edges of a shell, or something else of the same kind, to receive the sap. When they have extracted a sufficiency, they use it with a small brush, and delineate whatever figures they intend for the decoration of their work. They then lay on the gold-leaf, which is so strongly attracted by this liquor, that it never comes off.

**KOUANIN**, in the Chinese language, the name of a tutelary deity of women. The Chinese make great numbers of the figures of this deity in white porcelain, and send them to all parts of the world, as well as keep them in their own houses. The figure represents a woman with a child in her arms. The women who have no children pay a sort of adoration to these images, and suppose the deity they represent to have power to make them fruitful. The statue always represents a handsome woman very modestly attired.

**KOUC**, or **КОЕСК** (**Peter**), an excellent painter in the 16th century, was born at **Alost**, and was the disciple of **Bernard Van Orley**, who lived with **Raphael**. He went to **Rome**; and by studying the beautiful pieces which he found there, formed an excellent taste, and became a very correct designer. On his return to his own country, he undertook the office of directing the execution of some tapestry-work after the designs of **Raphael**. He was afterwards persuaded by some merchants of **Brussels** to undertake a voyage to **Constantinople**; but when he came there, finding that the Turks were not allowed by their religion to draw any figure, and that there was nothing for him to do but to draw designs for tapestry, he spent his time in designing the particular prospects in the neighbourhood of **Constantinople**, and the manner of the Turks living; of which he has left many wooden cuts, that alone suffice to give an idea of his merit. After his return from **Constantinople** he settled at **Antwerp**, where he drew several pictures for the emperor **Cha. V.** He was also a good architect; and, in the latter part of his life, wrote *A Treatise of Sculpture, Geometry, and Perspective*: and translated **Vitruvius** and **Serlin** into the **Flemish** tongue. He died in 1550.

**KOULI KHAN** (**Thamas**), or *Schah Nadir*, was not the son of a shepherd, as the authors of the **English Biographical Dictionary** assert; his father being chief of a branch of the tribe of **Affchars**, and governor of a fortress erected by that people against the **Turks**. Upon his father's death, his uncle usurped his

Kou-chi  
||  
Kouli-kh

Graffer's  
China, vo  
p. 486.

li-khan, his government, under the pretext of taking care of it during the minority of Kouli-Khan; or, more properly, young Nadir. Disgust at this affront made him commence adventurer. He entered into the service of Beglerberg, governor of Mafchada, in the Khorasan; who, discovering in him strong marks of a military genius, promoted him to the command of a regiment of cavalry. In 1720, the Ulbee Tartars having made an irruption into the Khorasan with 10,000 men, Beglerberg, whose whole force consisted only of 4000 horse and 2000 infantry, called a council of war, in which it was declared imprudent to face the enemy with such an inferior force: but Kouli-Khan proposed to march against the enemy, and engaged to conduct the expedition, and to be answerable for the success of it. He was accordingly made general; defeated the Tartars, and took their commander prisoner. Hossin Beglerberg received him at his return with marks of distinction: but growing jealous of his rising fame, instead of obtaining him the rank of lieutenant-general of the Khorasan, as he had promised, obtained it for another; which so exasperated Kouli-Khan, that he publicly complained of the governor's ingratitude and perfidy; who thereupon broke him, and ordered him to be punished with the battinado so severely, that the nails of his great toes fell off. This affront occasioned his flight, and his joining a banditti of robbers (not his stealing his father's or his neighbour's sheep). The rest of his adventures are too numerous to be inserted in this work. In 1729 he was made general of Persia by Schah Thamas, and permitted to take his name *Thamas*, and that of *Khuli*, which signifies *slave*: his title therefore was, *The slave of Thamas*; but he was ennobled by the addition of Khan. In 1736, he fomented a revolt against his master, for having made an ignominious peace with the Turks; and having the army at his command, he procured his deposition, and his own advancement to the throne. In 1739 he conquered the Mogul empire; and from this time growing as cruel as he was ambitious, he at length met with the usual fate of tyrants, being assassinated by one of his generals, in league with his nephew and successor, in 1747, aged sixty.

**KOUMISS**, a sort of wine made in Tartary, where it is used by the natives as their common beverage during the season of it, and often serves them instead of all other food. It is said to be so nourishing and salutary, that the Baschkir Tartars, who towards the end of winter are much emaciated, no sooner return in summer to the use of koumifs, than they become strong and fat. The author of "A historical description of all the nations which compose the Russian empire," says, speaking of Koumifs, *Elle est fort nourissante, et peut tenir lieu de tout autre aliment. Les Baschkirs s'en trouvent très bien, elle les rend bienportans et gais; elle leur donne de l'embonpoint, et de bonnes couleurs.* From the Tar-

tars it has been borrowed by the Russians who use it medicinally. It is made with fermented mares-milk, according to the following recipe communicated by Dr Grieve in the *Edin. Phil. Trans.* as he obtained it from a Russian nobleman, who went into that part of Tartary where it is made, for the sake of using it medicinally.

"Take of fresh mare's milk, of one day, any quantity; add to it a sixth part of water, and pour the mixture into a wooden vessel; use then, as a ferment, an eighth part of the fourest cow's milk that can be got; but at any future preparation, a small portion of old koumifs will better answer the purpose of souring; cover the vessel with a thick cloth, and let it in a place of moderate warmth; leave it at rest 24 hours, at the end of which time the milk will have become sour, and a thick substance will be gathered on the top; then with a stick made at the lower end in the manner of a churn-staff, beat it till the thick substance above mentioned be blended intimately with the subjacent fluid. In this situation, leave it again at rest for 24 hours more; after which pour it into a higher and narrower vessel, resembling a churn, where the agitation must be repeated as before, till the liquor appear to be perfectly homogeneous; and in this state it is called *koumifs*, of which the taste ought to be a pleasant mixture of sweet and sour. Agitation must be employed every time before it be used."—To this detail of the process the nobleman subjoined, that in order to obtain milk in sufficient quantity, the Tartars have a custom of separating the foal from the mare during the day, and allowing it to suck during the night: and when the milk is to be taken from the mare, which is generally about five times a day, they always produce the foal, on the supposition that she yields her milk more copiously when it is present.

To the above method of making koumifs, our author has added some particulars taken from other communications with which he was favoured by Tartars themselves. According to the account of a Tartar who lived to the south-east of Orenboug, the proportion of milk and souring ought to be the same as above; only, to prevent changing the vessel, the milk may be put at once into a pretty high and narrow vessel; and in order to accelerate the fermentation, some warm milk may be added to it, and, if necessary, more souring.—From a Tartar whom the Doctor met with at the fair of Macatieff upon the Volga, and from whom he purchased one of the leathern bags (A) which are used by the Kalmucks for the preparation and carriage of their koumifs, he learned that the process may be much shortened by heating the milk before the souring be added to it, and as soon as the parts begin to separate, and a thick substance to rise to the top, by agitating it every hour or ottener. In this way he made some in the Doctor's presence in the space of 12 hours. Our author learned also, that it was common among some

Kouli's.

Vol. i.  
p. 162.

(A) This bag was made of a horse's hide undressed, and by having been frosted had acquired a great degree of hardness. Its shape was conical, but was at the same time somewhat triangular, from being composed of three different pieces, set in a circular base of the same hide. The futures, which were made with tendons, were secured by a covering on the outside, with a doubling of the same skin, very closely secured. It had a dirty appearance, and a very disagreeable smell. On being asked the reason of this, he said, "The remains of the old koumifs were left, in order to supply a ferment to the new milk."

No. 100.

Tartars to prepare it in one day during summer, and that with only two or three agitations; but that in winter, when, from a deficiency of mares milk, they are obliged to add a great proportion of that of cows, more agitation and more time are necessary. And though it is commonly used within a few days after the preparation, yet when well secured in close vessels, and kept in a cold place, that it may be preserved for three months, or even more, without any injury to its qualities. He was told farther, that the acid fermentation might be produced by four milk as above, by a four parts of rye-flour, by the rennet of a lamb's stomach, or, what is more common, by a portion of old koumifs; and that in some places they saved much time, by adding the new milk to a quantity of that already fermented; on being mixed with which, it very soon undergoes the vinous change.

It was according to the process first mentioned, however, that all the koumifs which the Doctor employed in medicine was prepared.—It has been found serviceable in hectic and in nervous complaints; and our author relates some very striking cases which the use of it had completely cured. All those who drank it, our author informs us, agreed in saying, that during its use, they had little appetite for food; that they drank it in very large quantities, not only without disgust, but with pleasure; that it rendered their veins turgid, without producing languor; that, on the contrary, they soon acquired from it an uncommon degree of sprightliness and vivacity; that even in cases of some excess it was not followed by indigestion, headache, or any of the symptoms which usually attend the abuse of other fermented liquors.

The utility, however, of this preparation as a medicine, supposing it completely ascertained, would among us, as our author observes, be greatly circumscribed by the scarcity of mares milk in this country. "Hence (says he) inquiries will naturally be made, whether other species of milk admit of a similar vinous fermentation, and what proportion of spirit they contain. As these have never been the object, however, of my attention, I will here give the substance of what I have been able to learn from others respecting that which is the most common, the milk of cows.

"Dr Pallas, in the work above quoted, says, that cows milk is also susceptible of the vinous fermentation, and that the Tartars prepare a wine from it in winter, when mares milk fails them; that the wine prepared from cows milk, they call *airen*; but that they always prefer koumifs when it can be got, as it is more agreeable, and contains a greater quantity of spirit; that koumifs on distillation yields of a weak spirit one third, but that *airen* yields only two ninth parts of its whole quantity, which spirit they call *arika*.

"This account is confirmed by Oseretzkowsky, a Russian, who accompanied Lepechin and other academicians, in their travels through Siberia and Tartary. He published lately a dissertation on the ardent spirit to be obtained from cows milk.

"From his experiments it appears, that cows milk may be fermented with, or even without, souring, provided sufficient time and agitation be employed; that no spirit could be produced from any one of its constituent parts taken separately, nor from any two of them, unless inasmuch as they were mixed with some part of

the third; that the milk with all its parts in their natural proportion was the most productive of it; that the closer it was kept, or, which is the same thing, the more difficultly the fixed air is allowed to escape during the fermentation (care being taken, however, that we do not endanger the bursting of the vessel), the more spirit is obtained. He also informs us, that it had a sourer smell before than after agitation; that the quantity of spirit was increased, by allowing the fermented liquor to repose for some time before distillation; that from six pints of milk, fermented in a close vessel, and thus set to repose, he obtained three ounces of ardent spirit, of which one was consumed in burning; but that from the same quantity of the same milk fermented in an open vessel, he could scarcely obtain an ounce."

**KRAKEN**, in zoology, a most amazing large sea animal, said to be seemingly of a crab-like form; the credit of whose existence rests upon the evidence produced by bishop Pontoppidan, in his Natural history of Norway.

As a full grown kraken has never been seen in all its parts and dimensions, an accurate survey of which must employ some time, and not a little motion, it is impossible to give a complete description of one. Nevertheless, we shall submit the probability of its existence on the best information our author could collect, which seems to have fixed his own belief of it; though at the same time he acknowledges the account is very defective, and supposes a farther information concerning the creature may be reserved for posterity.

Our fishermen, says the author, unanimously and invariably affirm, that when they are several miles from the land, particularly in the hot summer days, and by their distance, and the bearings of some points of land, expect from eighty to a hundred fathoms depth, and do not find but from twenty to thirty; and more especially if they find a more than usual plenty of cod and ling, they judge that the kraken is at the bottom; but if they find by their lines that the water in the same place still shallows on them, they know he is rising to the surface, and row off with the greatest expedition till they come into the usual soundings of the place; when lying on their oars, in a few minutes the monster emerges, and shows himself sufficiently, though his whole body does not appear. Its back or upper part, which seems an English mile and a half in circumference (some have affirmed more), looks at first like a number of small islands, surrounded with something that floats like sea-weeds; at last several bright points of horns appear, which grow thicker the higher they emerge, and sometimes stand up as high and large as the masts of middle-sized vessels. In a short time it slowly sinks, which is thought as dangerous as its rising; as it causes such a swell and whirlpool as draws every thing down with it, like that of Malestrom. The bishop justly regrets the omission of probably the only opportunity that ever has or may be presented, of surveying it alive, or seeing it entire when dead. This, he informs us, once did occur, on the credit of the reverend Mr Friis, minister at Nordland, and vicar of the college for promoting Christian knowledge; who informed him that in 1680, a kraken (perhaps a young and careless one, as they generally keep several leagues from land) came into the waters that run between the

Kraken

rocks and cliffs near Alshoug; where, in turning about, some of its long horns caught hold of some adjoining trees, which it might easily have torn up, but that it was also entangled in some cliffs of the rocks, whence it could not extricate itself, but putrefied on the spot. Our author has heard of no person destroyed by this monster, but relates a report of the danger of two fishermen who came upon a part of the water full of the creature's thick slimy excrements (which he voids for some months, as he feeds for some other); they immediately strove to row off, but were not quick enough in turning to save the boat from one of the kraken's horns, which so crushed the head of it that it was with difficulty they saved their lives on the wreck, though the weather was perfectly calm; the monster never appearing at other times. His excrement is said to be attractive of other fish on which he feeds; which expedient was probably necessary, on account of his slow unwieldy motion to his subsistence; as this slow motion again may be necessary to the security of ships of the greatest force and burden, which must be overwhelmed on encountering such an immense animal, if his velocity was equal to his weight; the Norwegians supposing, that if his arms, on which he moves, and with which he takes his food, were to lay hold of the largest man of war, they would pull it down to the bottom.

In confirmation of the reality of this animal, our learned author cites Debes's description of Faroe, for the existence of certain islands which suddenly appear and as suddenly vanish. Many seafaring people, he adds, give accounts of such, particularly in the north sea; which their superstition has either attributed to the delusion of the devil, or considered as inhabited by evil spirits. But our honest historian, who is not for wronging the devil himself, supposes such mistaken islands to be nothing but the kraken, called by some the *see trolden*, or *sea mischief*; in which opinion he was greatly confirmed by the following quotation of Dr Hierne, a learned Swede, from baron Grippenhielm; and which is certainly a very remarkable passage, viz. "Among the rocks about Stockholm, there is sometimes seen a tract of land, which at other times disappears, and is seen again in another place. Buræus has placed it as an island in his map. The peasants, who call it *gummars ore*, say, that it is not always seen, and that it lies out in the open sea, but I could never find it. One Sunday, when I was out amongst the rocks sounding the coast, it happened, that in one place I saw something like three points of land in the sea, which surprised me a little, and I thought I had inadvertently passed them over before. Upon this I called to a peasant, to enquire for *gummars ore*; but when he came, we could see nothing of it; upon which the peasant said all was well, and that this prognosticated a storm or a great quantity of fish." To which our author subjoins, "who cannot discover that this *gummars ore*, with its points and prognostications of fish, was the kraken, mistaken by Buræus for an island, who may keep himself about that spot where he rises?" He takes the kraken, doubtless, from his numerous *tentaculi*, which serve him as feet, to be of the polype kind; and the contemplation of its enormous bulk led him to adapt a passage from Ecclesiasticus, xliii 31, 32. to it. Whether by it may be intended the dragon that is in the sea, mentioned Isaiah xxvii. 1. we refer

to the conjecture of the reader. After paying but a just respect to the moral character, the reverend function, and diligent investigations of our author, we must admit the possibility of its existence, as it implies no contradiction; though it seems to encounter a general prepossession of the whale's being the largest animal on or in our globe; and the eradication of any long prepossession is attended with something irksome to us. But were we to suppose a salmon or aurgeon the largest fish any number of persons had seen or heard of, and the whale had discovered himself as seldom, and but in part, as the kraken, it is easy to conceive that the existence of the whale had been as indigestible to such persons then as that of the kraken may be to others now. Some may incline to think such an extensive monster would encroach on the symmetry of nature, and be over proportionate to the size of the globe itself; as a little retrospection will inform us, that the breadth of what is seen of him, supposing him nearly round, must be full 2600 feet (if more oval, or crab-like, full 2000), and his thickness, which may rather be called *altitude*, at least three hundred; our author declaring he has chosen the least circumference mentioned of this animal for the greater certainty. These immense dimensions, nevertheless, we apprehend will not argue conclusively against the existence of the animal, though considerably against a numerous increase or propagation of it. In fact, the great scarcity of the kraken, his confinement to the north sea, and perhaps to equal latitudes in the south; the small number propagated by the whale, who is viviparous; and by the largest land animals, of whom the elephant is said to go near two years with young; all induce us to conclude from analogy, that this creature is not numerous; which coincides with a passage in a manuscript ascribed to Svere king of Norway, as it is cited by Ol. Wormius, in his Museum, p. 280, in Latin, which we shall exactly translate. "There remains one kind, which they call *halsguse*, whose magnitude is unknown, as it is seldom seen. Those who affirm they have seen its body, declare, it is more like an island than a beast, and that its carcass was never found; whence some imagine there are but two of the kind in nature." Whether the vanishing island Lemair, of which Captain Rodney went in search, was a kraken, we submit to the fancy of our readers. In fine, if the existence of the creature is admitted, it will seem a fair inference, that he is the scarcest as well as largest in our world; and that if there are larger in the universe, they probably inhabit some sphere or planet more extended than our own. Such we have no pretence to limit; and that fiction can devise a much greater than this is evident, from the cock of Mahomet, and the whale in the Bava Bathra of the Talmud, which were intended to be credited; and to either of which our kraken is a very shrimp in dimensions.

KRANTZIUS (Albertus), a native of Hamburgh, and a famous historian, who travelled over several parts of Europe, and was made rector of the university of Röstoch in 1482. He went from thence to Hamburgh in 1508, where he was elected dean of the chapter in the cathedral. He did many good services to that church and city; and was so famed for his abilities and prudence, that John king of Denmark and Frederic duke of Holstein did not scruple to make him

||  
Koster.

umpire in a dispute they had with the Dittmarsh. He wrote several good historical works; the most considerable of which is an Ecclesiastical History of Saxony, intitled *Metropolis*, in folio; the best edition is that of Francfort. He died in 1517.

KRAUT, or CROUT. See CROUT.

KUBESHA. See LESGUIS.

KUHNIUS (Joachim), a learned German critic, was born at Gripfwalde in Pomerania, in 1647. He was in 1669 made principal of the college at Oettingen in Suabia: in 1676, he was elected Greek professor in the principal college at Strafsburg; and after acquitting himself with honour for ten years in this capacity, was made Greek and Hebrew professor in the same university. His uncommon skill in the Greek language drew a great number of scholars about him from very distant places; and he published some classic authors with very learned notes both explanatory and critical. He died in 1697.

KUNCKEL (John), a celebrated Saxon chemist, born in the duchy of Sleswick, in 1630. He became chemist to the elector of Saxony, the elector of Brandenburg, and Charles II. king of Sweden, who gave him the title of *counsellor in metals*, and letters of nobility, with the surname of *Louwenfcing*. He employed 50 years in chemistry; in which, by the help of the furnace of a glass-house which he had under his care, he made several excellent discoveries, particularly of the phosphorus of urine. He died in Sweden in 1702; and left several works, some in German, and others in Latin: among which, that intitled *Observationes Chemicæ*, and the "Art of making Glass," printed at Paris in 1752, are the most esteemed.

KURIL or KURILSKI ISLES, extending from N. Lat. 51. to 45. which probably once lengthened the peninsula of Kamtchatka before they were convulsed from it, are a series of islands running south from the low promontory Lopatka, between which and Shoonska the most northerly is only the distance of one league. On the lofty Paramoufer, the second in the chain, is a high-peaked mountain probably volcanic; and on the fourth, called *Araunakutan*, is another volcano. On Urufs there is another; on Storgu there are two; and on Kanatir, or Kannachir, there is one. These three make part of the group which pass under the name of the land of *Jeso*. Japan abounds with volcanoes; so that there is a series of spiracles from Kamtchatka to Japan, the last great link of this extensive chain.—The Russians soon annexed these islands to their conquests. The sea abounded with otters, and the land with bears and foxes; and some of the isles sheltered the fable: temptations sufficient for the Russians to invade these islands; but the rage after the furs of the sea otters has been so great, that they are become extremely scarce both here and in Kamtchatka.

KUSTLER (Ludolf), a very learned writer in the 18th century, was born at Blomberg in Westphalia. When very young, he was upon the recommendation of baron Spauheim appointed tutor to the two sons

of the count de Schwerin, prime minister of the king of Prussia, who, upon our author's quitting that station, procured him a pension of 400 livres. He was promised a professorship in the university of Joachim; and till this should be vacant, being then but 25, he resolved to travel. He read lectures at Utrecht; went to England; and from thence to France, where he collated Suidas with three MSS. in the king's library, which furnished him with a great many fragments that had never been published. He was honoured with the degree of doctor by the university of Cambridge, which made him several advantageous offers to continue there: but he was called to Berlin, where he was installed in the professorship promised him. Afterward he went to Antwerp; and being brought over to the Catholic religion, he abjured that of the Protestants. The king of France rewarded him with a pension, and ordered him to be admitted supernumerary associate of the academy of inscriptions. But he did not enjoy this new settlement long; for he died in 1716, aged 46. He was a great master of the Latin tongue, and wrote well in it; but his chief excellence was his skill in the Greek language, to which he almost entirely devoted himself. He wrote many works; the principal of which are, 1. *Historia critica Homeri*. 2. *Jamblicus de vita Pythagoræ*. 3. An excellent edition of Suidas, in Greek and Latin, three volumes, folio. 4. An edition of Aristophanes, in Greek and Latin, folio. 5. A new Greek edition of the New Testament, with Dr Mill's Variations, in folio.

KYPHONISM, KYPHONISMUS, or *Cyphonismus*, an ancient punishment which was frequently undergone by the martyrs in the primitive times; wherein the body of the person to suffer was anointed with honey, and so exposed to the sun, that the flies and wasps might be tempted to torment him. This was performed in three manners: sometimes they only tied the patient to a stake; sometimes they hoisted him up into the air, and suspended him in a basket; and sometimes they stretched him out on the ground with his hands tied behind him. The word is originally Greek, and comes from *κρυφον*, which signifies either the *stake* to which the patient was tied, the *collar* fitted to his neck, or an *instrument* wherewith they tormented him: the scholiast on Aristophanes says, it was a wooden lock or cage; and that it was called so from *κρυφον*, "to crook or bend," because it kept the tortured in a crooked, bowing posture; others take the *κρυφον* for a log of wood laid over the criminal's head, to prevent his standing upright: Hesy chius describes the *κρυφον* as a piece of wood whereon criminals were stretched and tormented. In effect, it is probable the word might signify all these several things. It was a general name, whereof these were the species.

Suidas gives us the fragment of an old law, which punished those who treated the laws with contempt with kyphonism for the space of twenty days; after which they were to be precipitated from a rock, dressed in womens habit.

nism

## L.

**L** A semi-vowel, or liquid, making the eleventh letter of the alphabet.

It was derived from the old Hebrew Lamed, or Greek Lambda. It is founded by intercepting the breath between the top of the tongue and forepart of the palate, with the mouth open; and makes a sweet sound, with something of an aspiration; and therefore the Britons and Spaniards usually doubled it, or added an *b* to it, in the beginning of words, as in *llan*, or *llan*, "a temple," sounding nearly like *pl*. &c. In English words of one syllable it is doubled at the end, as *tell*, *bell*, *knell*, &c. but in words of more syllables than one it is single at the end, as *evil*, *general*, *constitutional*, &c. It is placed after most of the consonants in the beginning of words and syllables, as *black*, *glare*, *ad-les*, *ea-gle*, &c. but before none. Its sound is clear in *Allel*, but obscure in *able*, &c.

As a numeral letter, L denotes 50; and with a dash over it, thus, *L*, 5000. Used as an abbreviation, L stands for Lucius; and L. L. S. for a letter-see. See *SESTERCE*.

LA, the syllable by which Guido denotes the last sound of each hexachord; if it begins in C, it answers to our A; if in G, to E; and if in F, to D.

LABADIE (John), a famous French enthusiast, son of John Charles Labadie, governor of Bourges and gentleman in ordinary of the bed-chamber to the French king, was born in 1610. He entered young into the Jesuits college at Bourdeaux; which, by his own account, he afterwards quitted, but by other accounts was expelled for his peculiar notions, and for hypocrisy. He became a popular preacher; but being repeatedly detected in working upon female devotees with spiritual instructions for carnal purposes, his loss of character among the Catholics drove him among the Protestants. A reformed jesuit being thought a great acquisition, he was precipitately accepted as a pastor at Montauban, where he officiated for eight years; but, attempting the chastity of a young lady whom he could not convert to his purpose, and quarrelling with the Catholic priest about the right of interring a dead body, he was at length banished that place. The story of his affair with the lady, as related by Mr Balye, may here be given as a specimen of his ministry. Having directed this damsel to the spiritual life, which he made to consist in internal recollection and mental prayer, he gave her out a certain point of meditation; and having strongly recommended it to her to apply herself entirely for some hours to such an important object, he went up to her when he believed her to be at the height of her recollection, and put his hand into her breast. She gave him a hasty repulse, expressed a great deal of surprize at the proceeding, and was even preparing to rebuke him, when he, without being in the least disconcerted, and with a devout air, prevented her thus: "I see plainly, my child, that you are at a great distance from perfection; acknowledge your weakness with an humble spirit; ask forgiveness of God for your having given so little attention to the mysteries upon which you ought to have meditated. Had you bestowed all

necessary attention upon these things, you would not have been sensible of what was doing about your breast. But you are so much attached to sense, so little centered with the Godhead, that you were not a moment in discovering that I had touched you. I wanted to try whether your fervency in prayer had raised you above the material world, and united you with the Sovereign Being, the living source of immortality and of a spiritual state; and I see, to my great grief, that you have made very small progress, and that you only creep on the ground. May this, my child, make you ashamed, and for the future move you to perform the duties of mental prayer better than you have hitherto done." The young lady, who had as much good sense as virtue, was no less provoked at these words; than at the bold actions of her ghostly instructor; and could never afterwards bear the name of such an holy father. Labadie being driven out of Montauban, went to seek an asylum at Orange: but not finding himself so safe there as he imagined, he withdrew privately to Geneva, where he imposed on the people by his devout preaching and carriage; and from thence was invited to Middleburg, where his spirituality made him and his followers considered as so many saints, distinguished by the name of *Labadists*. They increased so much, that he excited the attention of the other churches, whose authority he disputed, till he was formally deposed by the synod of Dort. Instead of obeying, he procured a tumultuous support from a crowd of his devotees; and at length formed a little settlement between Utrecht and Amsterdam, where he erected a printing-press, which sent forth many of his works. Here he was betrayed by some deserters, who exposed his private life, and informed the public of his familiarities with his female disciples, under pretence of uniting them more particularly to God; and was finally obliged to retire to Altena in Holstein, where he died in 1674.

LABADISTS, a sect of religionists in the 17th century, followers of the opinions of John Labadie, of whom an account is given in the preceding article. Some of their opinions were, 1. That God could, and did deceive men. 2. That, in reading the Scriptures, greater attention should be paid to the internal inspiration of the Holy Spirit than to the words of the text. 3. That baptism ought to be deferred till mature age. 4. That the good and the wicked entered equally into the old alliance, provided they descended from Abraham; but that the new admitted only spiritual men. 5. That the observation of Sunday was a matter of indifference. 6. That Christ would come and reign 1000 years on earth. 7. That the eucharist was only a commemoration of the death of Christ; and that, though the symbols were nothing in themselves, yet that Christ was spiritually received by those who partook of them in a due manner. 8. That a contemplative life was a state of grace, and of divine union during this life, the summit of perfection, &c. 9. That the man whose heart was perfectly content and calm, half enjoys God, has familiar entertainments with him, and sees all things in him. 10. That this state was to be

Labadie.  
Labadists.

**Labarum** come at by an entire self abnegation, by the mortification of the senses and their objects, and by the exercise of mental prayer.

**LABARUM**, the banner or standard borne before the Roman emperors in the wars. The *labarum* consisted of a long lance, with a staff a-top; crossing it at right angles; from which hung a rich streamer, of a purple colour, adorned with precious stones. Till the time of Constantine it had an eagle painted on it; but that emperor, in lieu thereof, added a cross with a cipher expressing the name of *Jesus*.

This standard the Romans took from the Germans, Dace, Sarmatæ, Pannonians, &c. whom they had overcome. The name *labarum* was not known before the time of Constantine; but the standard itself, in the form we have described it, abating the symbols of Christianity, was used by all the preceding emperors. Some derive the word from *labor*, as if this finished their labours; some from *εὐλαβία*, "reverence, piety;" others from *λαμβάνειν*, "to take;" and others from *λατρεία*, "spoils."

**LABAT** (John Baptist), a celebrated traveller, of the order of St Dominic, was born at Paris, taught philosophy at Nancy, and in 1693 went to America in quality of a missionary. At his return to France in 1705, he was sent to the chapter of his order at Bologna to give an account of his mission, and staid several years in Italy. He died at Paris in 1738. His principal works are, 1. A new voyage to the American islands, 6 vols 12mo. 2. Travels in Spain and Italy, 8 vols 12mo. 3. A new account of the western parts of Africa, 5 vols 12mo.: Father Labat was not in Africa, and therefore was not a witness of what he relates in that work. He also published the *Chevalier des Marchais's voyage to Guinea*, in 4 vols 12mo.; and *An historical account of the western parts of Æthiopia*, translated from the Italian of Father Cavazzi, 5 vols 12mo.

**LABBE** (Philip), born at Bourges in France, in 1607; professed philosophy, divinity, and the languages, with great applause; and died in 1667, aged 70. He was a laborious writer, and a good critic; and wrote, 1. *Nova Bibliotheca MS. librorum*, in two volumes folio. 2. *De Byzantinæ historiæ Scriptoribus*. 3. *Galenî vita*. 4. *Bibliotheca bibliothecarum*. 5. *Concordantia chronologica*, &c. He began the last edition of "The councils," and died while the 9th volume was printing; they were finished in 17 volumes by father Cossart.

**LABDANUM**, or **LADANUM**, in the materia medica, a resinous juice, which exudes from a tree of the cistus kind. It is said to have been formerly collected from the beards of goats who browsed the leaves of the cistus: at present, a kind of rake, with several straps or thongs of skins fixed to it, is drawn lightly over the shrub, so as to take up the unctuous juice, which is afterwards scraped off with knives. It is rarely met with pure, even in the places which produce it; the dust, blown upon the plant by the wind, mingling with the tenacious juice: the inhabitants are also said to mix with it a certain black sand. In the shops two sorts are met with. The best (which is very rare) is in dark-coloured almost black masses, of the consistence of a soft platter, which grows still softer upon being handled; of a very agreeable smell, and

of a light pungent bitterish taste. The other sort is harder, not so dark coloured, in long rolls coiled up: this is of a much weaker smell than the first, and has a large admixture of a fine sand, which in the ladanum, examined by the French academy, made up three fourths of the mass.

In medicine it is used externally, to attenuate and discuss tumors; internally, it is more rarely used, but is greatly extolled by some against catarrhs and indigestions. Rectified spirit of wine almost entirely dissolves pure ladanum, leaving only a small portion of gummy matter which has no taste or smell: and hence this resin may be thus excellently purified for internal purposes. It is an useful ingredient in the stomachic plaster, which is now indeed styled the *emplastrum ladanum*.

**LABEL**, a long, thin, brass rule, with a small sight at one end, and a centre-hole at the other; commonly used with a tangent line on the edge of a circumferenter, to take altitudes, &c.

**LABEL**, in law, is a narrow slip of paper, or parchment, affixed to a deed or writing, in order to hold the appending seal.—Any paper annexed by way of addition or explication, to any will or testament, is also called a label or codicil.

**LABEL**, in heraldry, a fillet usually placed in the middle along the chief of the coat, without touching its extremities. Its breadth ought to be a ninth part of the chief. It is adorned with pendants; and when there are above three of these, the number must be specified in blazoning.

It is used on the arms of eldest sons while the father is alive, to distinguish them from the younger; and is esteemed the most honourable of all differences. See **HERALDRY**, p. 445. col. 1.

**LABIAL LETTERS**, those pronounced chiefly by means of the lips.

**LABIATED FLOWERS**, monopetalous flowers, consisting of a narrow tube with a wide mouth, divided into two or more segments.

**LABIAU**, a small town of Ducal Prussia, in a circle of the same name, seated at the mouth of the river Deime, with a strong castle, two sides of which are surrounded with water, and the other defended by a wall and ditch. E. Long. 19. 56. N. Lat. 55. 17.

**LABORATORY**, or **ELABORATORY**, the chemists work-house, or the place where they perform their operations, where the furnaces are built, their vessels kept, &c. and in general the term *laboratory* is applied to any place where physical experiments in pharmacy, chemistry, pyrotechny, &c. are performed.

As laboratories must be of very different kinds, according to the nature of the operations to be performed in them, it is impossible that any directions can be given which will answer for every one. Where the purposes are merely experimental, a single furnace or two of the portable kind will be sufficient. It is scarce needful to add, that shelves are necessary for holding vessels with the products of the different operations: and that it is absolutely necessary to avoid confusion and disorder, as by these means the products of the operations might be lost or mistaken for one another. Mortars, filters, levigating stones, &c. must also be procured: but from a knowledge of the methods of performing the different chemical operations will easily be derived the knowledge of a proper place to perform them.

them in; for which see the articles CHEMISTRY, METALLURGY, and FURNACE.

LABORATORY, in military affairs, signifies that place where all sorts of fire-works are prepared, both for actual service and for pleasure, viz. quick matches, fuzes, port-fires, grape-shot, case-shot, carcasses, hand-grenades, cartridges, shells filled, and fuzes fixed, wads, &c. &c.

LABOUR, in general, denotes a close application to work or business.—Among seamen a ship is said to be in labour when the rolls and tumbles very much, either a hull, under sail, or at anchor.—It is also spoken of a woman in travail or child birth; see MIDWIFERY.

LABOUREK, generally signifies one that does the most slavish and less artful part of a laborious work, as that of husbandry, masonry, &c.

LABOUREUR (John le), almoner to the king of France, and prior of Juvigne, was born at Montmorency near Paris in 1623. At the age of 18, he distinguished himself by publishing “A collection of the monuments of illustrious persons buried in the church of the Celestines at Paris, with their eulogies, genealogies, arms, and mottoes,” 4to. He afterwards published an excellent edition of The Memoirs of Michael de Callenau, with several other genealogical histories; and died in 1675.—He had a brother, *Louis le Laboureur*, bailiff of Montmorency, author of several pieces of poetry; and an uncle, *Dom. Claude le Laboureur*, provost of the abbey of L’isle Barbe, of which abbey he wrote a history, and published notes and corrections upon the breviary of Lyons, with some other things.

LABRADOR, the same with *New Britain*, or the country round *Hudson’s Bay*. See these articles.

LABRADORE STONE, a curious species of felspar, which exhibits all the colours of a peacock’s tail. See the article *FELT-SPAR*.

LABRUM, in antiquity, a great tub which stood at the entrance of the temples, containing water for the priests to wash themselves in previous to their sacrifices. It was also the name of a bathing tub used in the baths of the ancients.

LABRUS, in ichthyology, a genus of fishes belonging to the order of thoracii. The characters are as follow: The covers of the gills scaly; the branchiostegous rays unequal in number; teeth conic, long, and blunt at their ends; one tuberculated bone in the bottom of the throat; two above, opposite to the other; one dorsal fin reaching the whole length of the back; a slender skin extending beyond each ray, with a rounded tail. There are 41 species of this genus, which vary from each other, even those of the same species, almost infinitely in colour; some of them being of a dirty red mixed with a certain duskiness; others most beautifully striped, especially about the head, with the richest colours, such as blue, red, and yellow. Care must therefore be taken not to multiply the species from these accidental tints, but to attend to the form, which never varies. Mr Pennant mentions his having seen a species of labrus taken about the Giant’s Causeway in Ireland, of a most beautiful vivid green, spotted with scarlet; and others at Bandooran in the county of Sligo of a pale green. To this genus belongs the fish called by the English the *old-wife*.

LABURNUM, in botany. See *CYTISUS*.

LABYRINTH, among the ancients, was a large intricate edifice cut out into various aisles and meanders running into each other, so as to render it difficult to get out of it.

There is mention made of several of those edifices among the ancients; but the most celebrated are the Egyptian and the Cretan labyrinths.

That of Egypt, according to Pliny, was the oldest of all the known labyrinths, and was subsisting in his time after having stood 3600 years. He says it was built by king Petefucens, or Pithoes; but Herodotus makes it the work of several kings: it stood on the banks of the lake Mæris, and consisted of 12 large contiguous palaces, containing 300 chambers, 1500 of which were under ground.—Strabo, Diodorus Siculus, Pliny, and Mela, speak of this monument with the same admiration as Herodotus: but not one of them tells us that it was constructed to bewilder those who attempted to go over it; though it is manifest that, without a guide, they would be in danger of losing their way.

It was this danger, no doubt, which introduced a new term into the Greek language. The word *labyrinth*, taken in the literal sense, signifies a circumscribed space, intersected by a number of passages, some of which cross each other in every direction like those in quarries and mines, and others make larger or smaller circuits round the place from which they depart like the spiral lines we see on certain shells. In the figurative sense, it was applied to obscure and captious questions, to indirect and ambiguous answers, and to those discussions which, after long digressions, bring us back to the point from which we set out.

The Cretan labyrinth is the most famed in history or fable; having been rendered particularly remarkable by the story of the Minotaur, and of Theseus who found his way through all its windings by means of Ariadne’s clue. On Plate CCLIX. is exhibited a supposed plan of it, copied after a draught given by Menestius\*, taken from an ancient stone.—But what was the real nature of this labyrinth, merits a more particular inquiry.

Diodorus Siculus relates as a conjecture, and Pliny as a certain fact, that Dædalus constructed this labyrinth on the model of that of Egypt, though on a less scale. They add, that it was formed by the command of Minos, who kept the Minotaur shut up in it; and that in their time it no longer existed, having been either destroyed by time, or purposely demolished. Diodorus Siculus and Pliny, therefore, considered this labyrinth as a large edifice; while other writers represent it simply as a cavern hollowed in the rock, and full of winding passages. The two former authors, and the writers last mentioned, have transmitted to us two different traditions; it remains for us to choose that which is most probable.

If the labyrinth of Crete had been constructed by Dædalus under Minos, whence is it that we find no mention of it, neither in Homer, who more than once speaks of that prince and of Crete; nor in Herodotus, who describes that of Egypt, after having said that the monuments of the Egyptians are much superior to those of the Greeks; nor in the more ancient geographers; nor in any of the writers of the ages when Greece flourished?

This -

**Labyrinth.**

This work was attributed to Dædalus, whose name is alone sufficient to discredit a tradition. In fact, his name, like that of Hercules, had become the resource of ignorance, whenever it turned its eyes on the early ages. All great labours, all works which required more strength than ingenuity, were attributed to Hercules; and all those which had a relation to the arts, and required a certain degree of intelligence in the execution, were ascribed to Dædalus.

The opinion of Diodorus and Pliny supposes, that in their time no traces of the labyrinth existed in Crete, and that even the date of its destruction had been forgotten. Yet it is said to have been visited by the disciples of Apollonius of Tyana, who was contemporary with those two authors. The Cretans, therefore, then believed that they possessed the labyrinth.

"I would request the reader (continues the Abbe Barthélemi †, from whom these observations are extracted) to attend to the following passage in Strabo. At Napulia, near the ancient Argos, (says that judicious writer), are still to be seen vast caverns, in which are constructed labyrinths that are believed to be the work of the Cyclops: the meaning of which is, that the labours of men had opened in the rock passages which crossed and returned upon themselves, as is done in quarries. Such, if I am not mistaken, is the idea we ought to form of the labyrinth of Crete.

"Were there several labyrinths in that island? Ancient authors speak only of one, which the greater part place at Cnossus; and some, though the number is but small, at Gortyna.

"Belon and Tournefort have given us the description of a cavern situated at the foot of mount Ida, on the south side of the mountain, at a small distance from Gortyna. This was only a quarry according to the former, and the ancient labyrinth according to the latter; whose opinion I have followed, and abridged his account. Those who have added critical notes to his work, besides this labyrinth, admit a second at Cnossus, and adduce as the principal support of this opinion the coins of that city, which represent the plan of it, according as the artists conceived it. For on some of these it appears of a square form, on others round: on some it is only sketched out; on others it has, in the middle of it, the head of the Minotaur. In the Memoirs of the Academy of Belles Lettres, I have given an engraving of one which appears to me to be of about the 3th century before Christ; and on which we see on one side the figure of the Minotaur, and on the other a rude plan of the labyrinth. It is therefore certain, that at that time the Cnossians believed they were in possession of that celebrated cavern; and it also appears that the Gortynians did not pretend to contest their claim, since they have never given the figure of it on their money.

"The place where I suppose the labyrinth of Crete to have been situated, according to Tournefort, is but one league distant from Gortyna; and, according to Strabo, it was distant from Cnossus six or seven leagues. All we can conclude from this is, that the territory of the latter city extended to very near the former.

"What was the use of the caverns to which the name of labyrinth was given? I imagine that they were first excavated in part by nature; that in some places stones were extracted from them for building

cities; and that, in more ancient times, they served for a habitation or asylum to the inhabitants of a district exposed to frequent incursions. In the journey of Anacharsis through Phocis, I have spoken of two great caverns of Parnassus, in which the neighbouring people took refuge; in the one at the time of the deluge of Deucalion, and in the other at the invasion of Xerxes. I here add, that, according to Diodorus Siculus, the most ancient Cretans dwelt in the caves of Mount Ida. The people, when inquiries were made on the spot, said that their labyrinth was originally only a prison. It may have been put to this use; but it is difficult to believe that, to prevent the escape of a few unhappy wretches, such immense labours would have been undertaken."

*Labyrinth of the Ear.* See ANATOMY, p. 764.

LAC, MILK, among physicians. See MILK.

LAC, Gum. See LACCA.

LACARRY (Giles), a learned Jesuit of the 17th century, was born in the diocese of Cañres, in Languedoc, in 1605. He taught philosophy, theology, and the holy Scriptures in his society; was rector of the college of Cahors; and became well skilled in history. He wrote many works; the principal of which are, 1. *Hist. Galliarum sub Prefectis Prætorii Galliarum*, &c. a work which is much esteemed, and extends from the reign of Constantine to that of Justinian. 2. *Historia Romana a Julio Cesare ad Constantinum Magnum, per numismata & marmora antiqua*, an excellent work. 3. *Epitome historię Reg. Francię, ex Dionysio Petavio excerpta*, also much esteemed. 4. An edition of Veilicis Paterculius, with learned notes.

LACCA, LAC, or Gum-Lac is a kind of wax, of which a species of insects form cells upon trees, like honeycombs. See the article Coecus, spec. 5. In these cells remain some of the dead insects, which give a red colour to the whole substance of the lac. That called *slick-lac* is the wax adhering to some of the small branches of the tree, and which is unprepared. This lac, when separated from the adhering sticks, and grossly powdered, and deprived of its colour by digestion with menstrua, for the sake of the dyes and other purposes, is called *seed lac*; when the *slick-lac* is freed from impurities by melting it over a gentle fire, and formed into cakes, it is called *lump lac*; and lastly, that called *shell-lac* is the cells liquified, strained, and formed into thin transparent laminae in the following manner. Separate the cells from the branches, break them into small pieces, throw them into a tub of water for one day, wash off the red water and dry the cells, and with them fill a cylindrical tube of cotton cloth two feet long, and one or two inches in diameter; tie both ends, turn the bag above a charcoal fire; as the lac liquifies twist the bag, and when a sufficient quantity has transuded the pores of the cloth, lay it upon a smooth junk of the plantain-tree (*Musa Paradisiaca, Linnaei*), and with a strip of the plantain leaf draw it into a thin lamella; take it off while flexible, for in a minute it will be hard and brittle. The value of shell-lac is according to its transparency.

The lac insect is one of the most useful of that tribe yet discovered, particularly to the natives of the countries where it is found. They consume a great quantity of shell-lac in making ornamental rings, painted and gilded in various tastes, to decorate the arms of the

71.  
&c

the ladies; and it is formed into beads, spiral and linked chains for necklaces, and other female ornaments.—The following are recipes for various purposes to which this substance is applied by them.

1. For sealing wax. Take a stick, and heat one end of it upon a charcoal fire; put upon it a few leaves of the shell-lac softened above the fire; keep alternately heating and adding more shell lac until you have got a mass of three or four pounds of liquified shell-lac upon the end of your stick (in which manner lump lac is formed from seed lac). Knead this upon a wetted board with three ounces of levigated cinna-bar; form it into cylindrical pieces; and to give them a polish, rub them while hot with a cotton cloth.

2. For japanning. Take a lump of shell-lac, prepared in the manner of sealing-wax, with whatever colour you please, fix it upon the end of a stick, heat the polished wood over a charcoal fire, and rub it over with the half-melted lac, and polish by rubbing it even with a piece of folded plantain leaf held in the hand; heating the laquer and adding more lac as occasion requires. Their figures are formed by lac, charged with various colours in the same manner.

3. For Varnish. In ornamenting their images and religious houses, &c. they make use of very thin beat lead, which they cover with various varnishes, made of lac charged with colours. The preparation of them is kept a secret. The leaf of lead is laid upon a smooth iron heated by fire below while they spread the varnish upon it.

4. For Grindstones. Take of river sand three parts, of seed-lac washed one part, mix them over the fire in a pot, and form the mass into the shape of a grindstone, having a square hole in the centre, fix it on an axis with liquified lac, heat the stone moderately, and by turning the axis it may easily be formed into an exact orbicular shape. Polishing grindstones are made only of such sand as will pass easily through fine muslin, in the proportion of two parts sand to one of lac. This sand is found at Ragin-aul. It is composed of small angular crystalline particles tinged red with iron, two parts to one of black magnetic sand. The stone-cutters, instead of sand, use the powder of a very hard granite called *corune*. These grindstones cut very fast. When they want to increase their power, they throw sand upon them, or let them occasionally touch the edge of a vitrified brick. The same composition is formed upon sticks, for cutting stones, shells, &c. by the hand.

5. For Painting. Take one gallon of the red liquid from the first washing for shell-lac, strain it thro' a cloth, and let it boil for a short time, then add half an ounce of soap earth (fusil alkali); boil an hour more, and add three ounces of powdered lead (bark of a tree); boil a short time, let it stand all night, and strain next day. Evaporate three quarts of milk without cream to two quarts upon a slow fire, curdle it with four milk, and let it stand for a day or two; then mix it with the red liquid above mentioned; strain them through a cloth, add to the mixture one ounce and an half of alum, and the juice of eight or ten lemons: mix the whole and throw it into a cloth-bag strainer. The blood of the insect forms a coagulum with the caseous part of the milk, and remains in the bag, while a limpid acid water drains from it. The

coagulum is dried in the shade, and is used as a red colour in painting and colouring.

6. For Dyeing. Take one gallon of the red liquid prepared as before without milk, to which add three ounces of alum. Boil three or four ounces of tamarinds in a gallon of water, and strain the liquor. Mix equal parts of the red liquid and tamarind water over a brisk fire. In this mixture dip and wring the silk alternately until it has received a proper quantity of the dye. To increase the colour, increase the proportion of the red liquid, and let the silk boil a few minutes in the mixture. To make the silk hold the colour, they boil a handful of the bark called *lud* in water, strain the decoction, and add cold water to it; dip the dried silk into this liquor several times, and then dry it. Cotton cloths are dyed in this manner; but the dye is not so lasting as in silk.

The lac colour is preserved by the natives upon flakes of cotton dipped repeatedly into a strong solution of the lac insect in water, and then dried.

Among us lac is also used in various arts; being employed in the preparation of spirit-varnishes, for the making of sealing-wax, and as a colouring material for dying scarlet; see VARNISH, WAX, &c. It is insoluble in water; and difficultly soluble in spirit of wine, which for that purpose must be well dephlegmated. According to Neumann, 16 ounces of seed-lac, distilled in an open fire, yielded nine ounces and six drams of a butter or thick oil, one ounce six drams of a watery liquor neither acid nor alkaline, and a residuum weighing two ounces and a half. The colour given by lac is less beautiful, but more durable, than that given by cochineal. To render the colouring matter of the lac diffusible in water, so as to be applied to the stuffs to be dyed, Mr Hellet directs the following process: Let some powdered gum lac be digested during two hours in a decoction of comfrey root, by which a fine crimson colour is given to the water, and the gum is rendered pale or straw-coloured. To this tincture, poured off clear, let a solution of alum be added; and when the colouring matter has subsided, let it be separated from the clear liquor and dried. It will weigh about  $\frac{1}{10}$  of the quantity of lac employed. This dried fecula is to be dissolved or diffused in warm water, and some solution of tin is to be added to it, by which it acquires a vivid scarlet colour. This liquor is to be added to a solution of tartar in boiling water; and thus the dye is prepared.

The method of obtaining the fine red lac used by painters from this substance, is by the following simple process. Boil the stick-lac in water, filtre the decoction, and evaporate the clear liquor to a dryness over a gentle fire. The occasion of this easy separation is, that the beautiful red colour here separated, adheres only slightly to the outsides of the sticks broke off the trees along with the gum-lac, and readily communicates itself to boiling water. Some of this sticking matter also adhering to the gum itself, it is proper to boil the whole together; for the gum does not at all prejudice the colour, nor dissolve in boiling water: so that after this operation the gum is as fit for making sealing-wax as before, and for all other uses which do not require its colour.

Lac is likewise employed for medicinal purposes.

The

Lacca,  
Lace.

The stick-lac is the sort used. It is of great esteem in Germany, and other countries, for laxity and sponginess of the gums proceeding from cold or a scorbutic habit: for this use the lac is boiled in water, with the addition of a little alum, which promotes its solution; or a tincture is made from it with rectified spirit. This tincture is recommended also internally in the fluor albus, and in rheumatic and scorbutic disorders: it has a grateful smell, and not unpleasant, bitterish, astringent taste.

The gum-lac has been lately used as an electric, instead of glass, for electrical machines. See LACQUER, LAKE, and VARNISH.

*Artificial LACCA*, or *Lacque*, is also a name given to a coloured substance drawn from several flowers; as the yellow from the flower of the juniper, the red from the poppy, and the blue from the iris or violet. The tinctures of these flowers are extracted by digesting them several times in aqua-vitæ, or by boiling them over a slow fire in a lixivium of pot-ashes and alum.

An artificial lacca is also made of Brasil wood, boiled in a lixivium of the branches of the vine, adding a little cochineal, turmeric, calcined alum, and arsenic, incorporated with the bones of the cuttle-fish pulverized and made up into little cakes and dried. If it be to be very red, they add the juice of lemon to it; to make it brown, they add oil of tartar. Dove-coloured or columbine lacca is made with Brasil of Fernambuc, steeped in distilled vinegar for the space of a month, and mixed with alum incorporated in cuttle-fish bone. For other processes, see *COLOR-BLICKING*.

LACE, in commerce, a work composed of many threads of gold, silver, or silk, interwoven the one with the other, and worked upon a pillow with spindles according to the pattern designed. The open work is formed with pins, which are placed and displaced as the spindles are moved. The importation of gold and silver lace is prohibited.

*Method of Clearing Gold-LACE and Embroidery when tarnished.*—For this purpose alkaline liquors are by no means to be used; for while they clean the gold, they corrode the silk, and change or discharge its colour. Soap also alters the shade, and even the species of certain colours. But spirit of wine may be used without any danger of its injuring either the colour or quality of the subject; and in many cases proves as effectual, for restoring the lustre of the gold, as the corrosive detergents. A rich brocade, flowered with a variety of colours, after being disagreeably tarnished, had the lustre of the gold perfectly restored by washing it with a soft brush dipt in warm spirit of wine; and some of the colours of the silk, which were likewise soiled, became at the same time remarkably bright and lively. Spirit of wine seems to be the only material adapted to this intention, and probably the hoasted secret of certain artificers is no other than this spirit disguised. Among liquids, Dr Lewis says, he does not know of any other that is of sufficient activity to discharge the soul matter, without being hurtful to the silk: as to powders, however fine, and however cautiously used, they scratch and wear the gold, which here is only superficial and of extreme tenuity.

But tho' spirit of wine is the most innocent material that can be employed for this purpose, it is not in all

cases proper. The golden covering may be in some parts worn off; or the base metal, with which it had been iniquitously alloyed, may be corroded by the air, so as to leave the particles of the gold disunited; while the silver underneath, tarnished to a yellow hue, may continue a tolerable colour to the whole: in which cases it is apparent, that the removal of the tarnish would be prejudicial to the colour, and make the lace or embroidery less like gold than it was before. A piece of old tarnished gold-lace, cleaned by spirit of wine, was deprived, with its tarnish, of the greatest part of its golden hue, and looked now almost like silver-lace.

*Method of separating the Gold and Silver from LACE without burning it.* Cut the lace in pieces, and (having separated the thread from it by which it was sewed to the garment) tie it up in a linen cloth, and boil it in soap ley, diluted with water, till you perceive it is diminished in bulk; which will take up but a little time, unless the quantity of lace be very considerable. Then take out the cloth, and wash it several times in cold water, squeezing it pretty hard with your foot, or beating it with a mallet, to clear it of the soap-ley; then untie the cloth, and you will have the metallic part of the lace pure, and nowhere altered in colour or diminished in weight.

This method is abundantly more convenient and less troublesome than the common way of burning; and as a small quantity of the ley will be sufficient, the expence will be trifling, especially as the same ley may be used several times, if cleared of the silky calcination. It may be done in either an iron or copper vessel.

The ley may be had at the soap-boilers, or it may be made of pearl-ash and quick-lime boiled together in a sufficient quantity of water.

The reason of this sudden change in the lace will be evident to those who are acquainted with chemistry: for silk, on which all our laces are wove, is an animal substance, and all animal substances are soluble in alkalies, especially when rendered more caustic by the addition of quicklime; but the linen you tie it in, being a vegetable, will remain unaltered.

*Blond-LACE*, a lace made of fine linen thread or silk, much in the same manner as that of gold and silver. The pattern of the lace is fixed upon a large round pillow, and pins being stuck into the holes or openings in the patterns, the threads are interwoven by means of a number of bobbins made of bone or ivory, each of which contains a small quantity of fine thread, in such a manner as to make the lace exactly resemble the pattern. There are several towns in England, and particularly in Buckinghamshire, that carry on this manufacture; but vast quantities of the finest lace have been imported from Flanders.

LACEDÆMON (fab. hist.), a son of Jupiter and Tayget the daughter of Atlas, who married Sparta the daughter of Europa, by whom he had Amyclas and Eurydice the wife of Acrisius. He was the first who introduced the worship of the Graces in Laconia, and who first built them a temple. From Lacedæmon and his wife, the capital of Laconia was called *Lacedæmon* and *Sparta*.

LACEDÆMON, a noble city of Peloponnesus, called also *Sparta*; these names differing in this, that the latter is the proper and ancient name of the city, the former of the country, which afterwards came

came to be applied to the city (Strabo, Stephanus.) Homer also makes this distinction; who calls the country *holy*, because encompassed with mountains. It has also been severally known by the name of *Lelegia*, from the Leleges the first inhabitants of the country, or from Lelex one of their kings; and *Oebalia*, from *Oebalus* the sixth king from Eurotas. It was also called *Hecatompolis*, from 100 cities which the whole province once contained. This city was the capital of Laconia, situated on the right or west side of the Eurotas: it was less in compass than, however equal, or even superior, to Athens in power. Polybius makes it 48 stadia, a circuit much inferior to that of Athens. Lelex is supposed to have been the first king of Lacedæmon. His descendants, 13 in number, reigned successively after him, till the reign of the sons of Orestes, when the Heraclidæ recovered the Peloponnesus about 80 years after the Trojan war. Procles and Eurythenes, the descendants of the Heraclidæ, usurped the crown together; and after them it was decreed that the two families should always sit on the throne together. The monarchial power was abolished, and the race of the Heraclidæ extinguished at Sparta about 219 years before Christ. Lacedæmon in its flourishing state remained without walls, the bravery of its citizens being instead of them (Nepos). At length in Cassander's time, or after, when the city was in the hands of tyrants, distrustful the defence by arms and bravery, a wall was built round it, at first slight, and in a tumultuary, or hasty manner; which the tyrant Nabis made very strong (Livy, Justin). Pausanias ascribes the first walls to the times of Demetrius and Pyrrhus, under Nabis. The walls of the city were pulled down 188 years before Christ by Philopœmen, who was then at the head of the Achæan league, and Laconia some time after became a Roman province when reduced by Mummius. See SPARTA.—The present city is called *Misura*, situated in E. Long. 23. 0. N. Lat. 36. 55.

LACERNA, a coarse thick garment worn by the Romans over their gowns like a cloak, to keep off the rain and cold. It was first used in the camp, but afterwards admitted into the city. The emperors wore the lacerna of a purple dye. The lacerna was at first very short, but was lengthened after it became fashionable; before this time it was confined to the soldiers. Senators were forbidden wearing it in the city by Valentinian and Theodosius. Martial makes mention of lacernæ worth 10,000 sesterces. Some confound this garment with the penula; but it seems rather to have resembled the *chlamys* and *birrus*.

LACERTA, the LIZARD, in zoology, a genus of amphibious animals, belonging to the order of reptilia, the characters of which are these: The body is naked, with four feet, and a tail. There are 49 species: the most remarkable are,

1. The crocodylus, or crocodile, has a compressed jagged tail, five toes on the fore and four on the hind-foot. This is the largest animal of the lizard kind. One that was dissected at Siam, an account of which was sent to the Royal Academy at Paris, was 18 feet and a half long, of which the tail was no less than five feet and a half, and the head and neck above two feet and a half. He was four feet and nine inches in circumference where thickest.

The hinder legs, including the thigh and the paw,

were two feet and two inches long; the paws, from the joint to the extremity of the longest claws, were above nine inches. They were divided into four toes; of which three were armed with large claws, the longest of which was an inch and a half, and seven lines and a half broad at the root. The fourth toe was without a nail, and of a conical figure; but was covered with a thick skin like shagreen leather. These toes were united with membranes like those of ducks, but much thicker.

The fore-legs had the same parts and conformation as the arms of a man, both within and without; but they were somewhat shorter than those behind. The hands had five fingers, the two last of which had no nails, and were of a conical figure, like the fourth toe on the hind paws. The head was long, and had a little rising at the top; but the rest was flat, and especially towards the extremity of the jaws. It was covered with a skin, which adhered firmly to the skull and to the jaws. The skull was rough and unequal in several places; and about the middle of the forehead there were two bony crests, about two inches high. They were not quite parallel, but separated from each other in proportion as they mounted upwards.

The eye was very small in proportion to the rest of the body; and was so placed within its orbit, that the outward part, when shut, was only a little above an inch in length, and run parallel to the opening of the jaws.

The nose was placed in the middle of the upper jaw, near an inch from its extremity, and was perfectly round and flat, being two inches in diameter, of a black, soft, spongy substance, not unlike the nose of a dog. The nostrils were in the form of a Greek capital  $\Sigma$ ; and there were two caruncles which filled and closed them very exactly, and which opened as often as he breathed through the nose. The jaws seemed to shut one within another by means of several apophyses, which proceeded from above downwards, and from below upwards, there being cavities in the opposite jaw to receive them. They had 27 dog-teeth in the upper jaw and 15 in the lower, with several void spaces between them. They were thick at the bottom, and sharp at the point; being all of different sizes, except ten large hooked ones, six of which were in the lower jaw, and four in the upper. The mouth was 15 inches in length, and eight and a half in breadth where broadest; and the distance of the two jaws, when opened as wide as they could be, was 15 inches and a half. The skull, between the two crests, was proof against a musket-ball, for it only rendered the part a little white that it struck against.

The colour of the body was of a dark brown on the upper part, and of a whitish citron below, with large spots of both colours on the sides. From the shoulders to the extremity of the tail he was covered with large scales of a square form, disposed like parallel girdles, and were 52 in number; but those near the tail were not so thick as the rest. In the middle of each girdle there were four protuberances, which became higher as they approached the end of the tail, and composed four rows; of which the two in the middle were lower than the remaining two, forming three channels, which grew deeper the nearer they came to the tail, and were confounded with each other about two feet from its extremity.

The skin was defended with a sort of armour which

Lacerta.

which, however, was not proof against a musket-ball, contrary to what has been commonly said. However, it must be acknowledged, that the attitude in which it was placed might contribute not a little thereto; for probably, if the ball had struck obliquely against the shell, it would have flown off. Those parts of the girdles underneath the belly were of a whitish colour, and were made up of scales of divers shapes. They were about one sixth of an inch in thickness, and were not so hard as those on the back.

This creature is, however, said to grow to a still larger size than that above mentioned, some having been known to measure 25 feet in length.—They have no tongue; but in place of that organ there is a sort of membrane attached by its edges to the two sides of the under jaw.

The crocodile lays eggs, which she covers over with sand, and leaves to be hatched by the heat of the sun. They are to be met with in the rivers Nile, Niger, and Ganges, besides most other large rivers in the southern parts of Asia, Africa, and America.

Mr Halfelquist informs us, that the crocodile swallows stones to assist digestion, after the manner of seed-eating birds, which commit to the stomach the work of mastication as well as concoction, being destitute of the instruments adapted to that purpose. The Egyptians say, that his excrements do not pass by the anus: this seems to be confirmed by the structure of the gut, which is near the pylorus; for it cannot easily be conceived that excrements should pass through such a narrow passage, seemingly destined for the conveyance of the chyle only; but the structure of the parts, and the gut being so near the pylorus, seem to indicate that the excrements pass through it into the ventricle, and are vomited up. The inhabitants above Cairo say they see this daily; and observe, that the crocodile is obliged to come on shore as often as he has occasion to ease himself. There is a folliculus, of the bigness of a hazel-nut, under the shoulders of the old crocodiles, which contains a thick matter smelling like musk. The Egyptians are very anxious to get this when they kill a crocodile, it being a perfume much esteemed by the grandees. When the male copulates with the female, he turns her with his snout on her back. The Egyptians use the fat against the rheumatism and stiffness of the tendons, esteeming it a powerful remedy outwardly applied. They say the gall is good for the eyes; they make use of it as a certain remedy for barrenness in women, taking about six grains internally, and outwardly they apply a pessus made of cotton and the gall of a crocodile. The eyes of the crocodile are the best aphrodisiacs of any known by the Arabs; who prefer them to all confections, dea-fatyrii, hyacinthi, &c. and even to ambergris.

The crocodile is a very dangerous and terrible animal in some countries. It does a great deal of mischief among the common people of Upper Egypt, often killing and devouring women who come to the river to fetch water, and children playing on the shore or swimming in the river. In the stomach of one dissected before Mr Barton the English consul, they found the bones of the legs and arms of a woman, with the rings which they wear in Egypt as ornaments. These animals are seen in some places lying for whole hours, and even days, stretched in the sun and motionless; so that one not used to them might mistake

them for trunks of trees covered with a rough and dry bark: but the mistake would soon be fatal; for the seemingly torpid animal, at the near approach of any living creature, instantly darts upon it, and carries it to the bottom. In the times of an inundation they sometimes enter the cottages of the natives, where they seize the first animal they meet with. There have been several examples of their taking a man out of a canoe in the sight of his companions, without their being able to lend him any assistance. The crocodile, however, except when pressed with hunger, or with a view of depositing its eggs, seldom leaves the water. Its usual method is to float along upon the surface, and seize whatever animals come within its reach; but when this method fails, it then goes closer to the bank. There it waits in patient expectation of some land animal that comes to drink; the dog, the bull, the tiger, or man himself. Nothing is to be seen as the animal approaches, nor is its retreat discovered till it is too late for safety. It seizes the victim with a spring, and goes at a bound much faster than such an unwieldy animal could be supposed to do; then having secured the creature both with teeth and claws, it drags it into the water, instantly sinks with it to the bottom, and in this manner quickly drowns it. Sometimes it happens, that the creature wounded by the crocodile makes its escape; in which case, the latter pursues with great celerity, and often takes it a second time. In these depredations, however, this terrible animal often seizes on another as formidable as itself, and meets with a desperate resistance. We are told of frequent combats between the crocodile and the tiger. All creatures of the tiger kind are continually oppressed by a parching thirst, that keeps them in the vicinity of great rivers, whither they descend to drink very frequently. On these occasions they are seized by the crocodile; upon whom they instantly turn with the greatest agility, and force their claws into his eyes, while he plunges with his fierce antagonist into the river. There they continue to struggle for some time, till at last the tiger is drowned. Notwithstanding all this, however, we are assured by Labat, that a negro, with no other weapon than a knife in his right hand, and his left arm wrapped round with a cow-hide, ventures boldly to attack this animal in its own element. As soon as he approaches the crocodile, he presents his left arm, which the animal swallows most greedily: but as it ticks in his throat, the negro has time to give it several stabs below the chin, where it is easily vulnerable; and the water also getting in at the mouth, which is held involuntarily open, the creature is soon bloated up as big as a tun, and expires.

The natives of Siam seem particularly fond of the capture of all the great animals with which their country abounds. The crocodiles are taken by throwing three or four strong nets across a river, at proper distances from each other; so that if the animal breaks through the first, it may be caught by one of the rest. When it is first taken, it employs the tail, which is the grand instrument of strength, with great force; but after many unsuccessful struggles, the animal's strength is at last exhausted. Then the natives approach their prisoner in boats, and pierce him in the most tender parts till he is weakened by loss of blood. When he has done stirring, they begin by tying up his mouth,

and

Lacerta.

and with the same cord tie his head to his tail, which last they bend back like a bow. However, they are not yet perfectly secure from his fury; but for their greater safety they tie his fore feet, as well as those behind, to the top of his back. These precautions are not useless; for if they were to omit them, the crocodile would soon recover strength enough to do a great deal of mischief. When thus brought into subjection, or when taken young and tamed, this formidable animal is used to divert and entertain the great men of the east. It is often managed like an horse; a curb is put into its mouth, and the rider directs it as he thinks proper. Though awkwardly formed, it does not fail to proceed with some degree of swiftness; and is thought to move as fast as some of the most unwieldy of our own animals, the hog or the cow. Some indeed assert, that no animal could escape it but for its slowness in turning; which, however, seems very improbable, as its back-bone is full of articulations, and seemingly as flexible as that of other large animals.

All crocodiles breed near fresh waters; and though they are sometimes found in the sea, yet that may be considered rather as a place of excursion than abode. They produce their young by eggs, as was said above; and for this purpose, the female, when she comes to lay, chooses a place by the side of a river, or some fresh-water lake, to deposit her brood in. She always pitches upon an extensive sandy shore, where she may dig a hole without danger of detection from the ground being fresh turned up. The shore must also be gentle and shelving to the water, for the greater convenience of the animal's going and returning; and a convenient place must be found near the edge of the stream, that the young may have a shorter way to go. When all these requisites are adjusted, the animal is seen cautiously stealing up on shore to deposit her burden. The presence of a man, a beast, or even a bird, is sufficient to deter her at that time; and if she perceives any creature looking on, she infallibly returns. If, however, nothing appears, she then goes to work, scratching up the sand with her fore-paws, and making a hole pretty deep in the shore. There she deposits from 80 to 100 eggs, of the size of a tennis-ball, and of the same figure, covered with a tough white skin like pitchment. She takes above an hour to perform this task; and then covering up the place so artfully that it can scarcely be perceived, she goes back to return again the next day. Upon her return with the same precaution as before, she lays about the same number of eggs; and the day following also a like number. Thus having deposited her whole quantity, and having covered them close up in the sand, they are soon vivified by the heat of the sun; and at the end of 30 days the young ones begin to break open the shell. At this time the female is instinctively taught that her young ones want relief; and she goes upon land to scratch away the sand and set them free. Her brood quickly avail themselves of their liberty; a part run unguided to the water; another part ascend the back of the female, and are carried thither in greater safety. But the moment they arrive at the water, all natural connection is at an end; when the female has introduced her young to their natural element, not only she, but the male, become amongst the number of their most formidable enemies, and devour as many of them as they can. The whole brood scatters into different parts

at the bottom; by far the greatest number are destroyed, and the rest find safety in their agility or minuteness.

But it is not the parent alone that is thus found to thin their numbers: the eggs of this animal are not only a delicious feast to the savage, but are eagerly sought after by every beast and bird of prey. The ichneumon was erected into a deity among the ancients for its success in destroying the eggs of these monsters: at present that species of the vulture called the *gallinazo* is their most prevailing enemy. All along the banks of great rivers, for thousands of miles, the crocodile is seen to propagate in numbers that would soon over-run the earth, but for the vulture, that seems appointed by Providence to abridge its fecundity. These birds are ever found in great numbers where the crocodile is most numerous; and hiding themselves within the thick branches of the trees that shade the banks of the river, they watch the female in silence, and permit her to lay all her eggs without interruption. Then when she has retired, they encourage each other with cries to the spoil; and flocking all together upon the hidden treasure, tear up the eggs, and devour them in a much shorter time than they were deposited. Nor are they less diligent in attending the female while she is carrying her young to the water; for if any one of them happens to drop by the way, it is sure to receive no mercy.

Such is the extraordinary account given us by late travellers of the propagation of this animal; an account adopted by Linnæus and the most learned naturalists of the age. Yet if one might argue from the general analogy of nature, the crocodile's devouring her own young when she gets to the water seems doubtful. This may be a story raised from the general idea of this animal's rapacious cruelty; when in fact the crocodile only seems more cruel than other animals, because it has more power to do mischief. It is probable that it is not more devoid of parental tenderness than other creatures; and we are the more led to think so, from the peculiar formation of one of the crocodile kind, called,

2. The *open-bellied crocodile*: which is furnished with a false belly like the opossum, where the young creep out and in as their dangers or necessities require. The crocodile, thus furnished at least, cannot be said to be an enemy to her own young, since she thus gives them more than parental protection. It is probable also that this open-bellied crocodile is viviparous, and fosters her young that are prematurely excluded in this second womb until they come to proper maturity.

This crocodile is a species that was not described by Linnæus; but has been inserted in the *Synonyma Naturæ* since his death, under the name of *Lacerta gangetica*. Mr Edwards tells us, that three of these creatures were sent from Bengal about the year 1747, to the late Dr Mead physician in ordinary to the king. Two of them the Doctor preferred in his collection, and presented the third to the late curious Mrs Kennon; and since the decease of these worthy persons, they became the property of Mr James Lemon of London, who obliged our author with one of them to produce to the royal society. The narrowness of the beak is the most extraordinary circumstance in this crocodile, which appears like

Lacerta.

the bill of the bird called *gonfander*. It has small sharp teeth. Another peculiarity is a paunch or open purse in the middle of the under side of the belly, which seems to be naturally formed with round hips, and hollow within, to receive its young in time of danger, as it appears in the American animal called *opofum*. Dr Parsons gave it as his opinion, that the opening in the belly was really natural, it having no appearance of being cut or torn open. In other respects it hath all the marks common to alligators or crocodiles. The beak was finely creased transversely. The animal appeared in the spirits all over of a yellowish olive colour, the under side lighter than the upper, the latter having some dusky marks and spots. This species inhabits the banks of the Ganges; and it is very strange that they should never have been described before, as our India company have been so long settled there, and the animal is at full growth nearly, if not altogether, as large as the common crocodile.

How long the crocodile lives we are not certainly informed; if we may believe Aristotle, it lives the age of a man; but the ancients so much amused themselves in inventing fables concerning this animal, that even truth from them is suspicious. What we know for certain from the ancients is, that among the various animals that were produced to fight in the amphitheatre at Rome, the combat of the crocodile was not wanting. Marcus Scaurus produced them living in his unrivalled exhibitions; and the Romans considered him as the best citizen, because he furnished them with the most expensive entertainments.

3. The alligator, or American crocodile, has a vast mouth, furnished with sharp teeth; from the back to the end of the tail, ferrated; skin tough and brown, and covered on the sides with tubercles. This dreadful species, which grows to the length of 17 or 18 feet, is found in the warmer parts of North America; and most numerous as we approach the south, and the more fierce and ravenous. Yet in Carolina it never devours the human species, but on the contrary shuns mankind; it will, however, kill dogs as they swim the rivers, and hogs which feed in the swamps. It is often seen floating like a log of wood on the surface of the water, and is mistaken for such by dogs and other animals, which it seizes and draws under water to devour at its leisure. Like the wolf, when pressed by long hunger, it will swallow mud, and even stones and pieces of wood. They often get into the weirs in pursuit of fish, and do much mischief by breaking them to pieces. They are torpid during the winter in Carolina; and retire into their dens, which they form by burrowing far under ground. It makes the entrance under water, and works upwards. In spring it quits its retreat, and resorts to the rivers, which it swims up and down; and chiefly seeks its prey near the mouth, where the water is brackish.—It roars and makes a dreadful noise at its first leaving its den, and against bad weather. It lays a vast number of eggs in the sand, near the banks of lakes and rivers, and leaves them to be hatched by the sun: multitudes are destroyed as soon as hatched either by their own species or by fish of prey. In South America the carrion vulture is the instrument of Providence to destroy multitudes; by that means preventing the country from being rendered uninhabitable.

4. The Cayman, or Antilles crocodile, which has by different authors been confounded with the two preceding species, is evidently different from both; and has accordingly been properly distinguished by the Abbe Bonnaeire in the *Encyclopédie Methodique*. See our figure, where the differences are so apparent as to require no detail.—The greatest strength of this animal, according to M. Merian, consists in its teeth, of which there are two rows crossing one another, by means of which it grinds with the greatest ease whatever it seizes upon. But it must not be understood from this that there is a double row of teeth, as Seba pretends, on each side of the under jaw: but only that there are two rows on each jaw, one on the right and the other on the left side.—The *Cayman* is so called from some small isles of that name among the Antilles, where these creatures are said to be very numerous. They are of exceeding strength, and equally the dread both of men and animals; for they live on land as well as in the water, and devour every creature they meet with.—Another figure is added, representing an egg with the young one at the time of breaking the shell. See the Plates.

5. The *caudiverbera*, has a depressed pinnatifid tail, and palmated feet. It is larger than the common green lizard, is found in Peru, and has got its name from its beating the ground with its tail.

6. The *stellio* has a verticillated tail, and dentated scales. It is a native of Africa, and the warm parts of Asia. It frequents the ruinous walls of Natolia, Syria, and Palestine. The Arabs call it *bardum*. The Turks kill it; for they imagine, that, by declining the head, it mimics them while they say their prayers.

7. The *agilis*, has a pretty long verticillated tail, with sharp scales, and a scaly collar. This is the common green lizard, and is a native both of Europe and India. This species is extremely nimble: in hot weather it basks on the sides of dry banks or old trees; but, on being observed, immediately retreats to its hole. The food of this species, as well as of all the other British lizards, is insects; and they themselves are devoured by birds of prey. They are all perfectly harmless; yet their form strikes one with disgust, and has occasioned great obscurity in their history. Mr Pennant mentions a lizard killed in Worcestershire in the year 1714, which was two feet six inches long, and four inches in girth. The fore-legs were placed eight inches from the head; the hind-legs five inches beyond those: the legs were two inches long; the feet divided into four toes, each furnished with a sharp claw. Another of the same kind was afterwards killed in that county; but whether these large lizards were natives of other countries and imported into England, or whether they were of British growth, is uncertain.

8. The *chamæleon* has a crooked cylindrical tail. The head of a large *chamæleon* is almost two inches long, and from thence to the beginning of the tail it is four inches and a half. The tail is five inches long, and the feet two and a half. The thickness of the body is different at different seasons; for sometimes from the back to the belly it is two inches, and sometimes but one; for he can blow himself up and contract himself at pleasure. This swelling and contraction is not only of the back and belly, but also of the legs and tail.

*Gangetica.*

*Salamander.*

*Gecko.*

*Procodile.*

*Sinensis.*

*Stellio.*

*Cayman.*

These different motions are not like those of other animals, which proceed from a dilatation of the breast in breathing, and which rises and falls successively; but they are very irregular, as in tortoises and frogs. The chameleon has continued as it were blown up for two hours together, and then he would grow less and less insensibly: for the dilatation was always more quick and visible than the contraction. In this last state he appeared extremely lean, and the spine of the back was sharp, and all his ribs might be told; likewise the tendons of the arms and legs might be seen very distinctly.

The skin is very cold to the touch; and notwithstanding he seems so lean, there is no feeling the beating of the heart. The surface of the skin is unequal, and has a grain not unlike shagreen, but very soft, because each eminence is as smooth as if it was polished. Some of these are as large as a middling pin's head on the arms, legs, belly, and tail; but on the shoulders and head they are of an oval figure, and a little larger. Those under the throat are ranged in the form of a chaplet, from the lower lip to the breast. Some on the head and back are amassed together in clusters, with spaces between them, on which are almost imperceptible spots of a pale red and yellow colour, as well as the ground of the skin itself, which plainly appears between these clusters. This ground changes colour when the animal is dead, becoming of a greyish brown, and the small spots are whitish.

The colour of all these eminences, when the chameleon is at rest in a shady place, is of a bluish grey, except on the claws, where it is white with a little yellow; and the spaces between the clusters is of a pale red and yellow, as was before observed. But when he is in the sun, all parts of the body which are affected with the light become of a greyish brown, or rather of a tawney. That part of the skin which the sun does not shine on, changes into several brighter colours, which form spots of the size of half one's finger. Some of these descend from the spine half way on the back; and others appear on the sides, arms, and tail. They are all of an Isabella colour, from a mixture of a pale yellow and of a bright red, which is the colour of the ground of the skin.

The head of a chameleon is not unlike that of a fish, it being joined to the breast by a very short neck, covered on each side with cartilaginous membranes resembling the gills of fishes. There is a crest directly on the top of the head, and two others on each side above the eyes, and between these there are two cavities near the top of the head. The muzzle is blunt, and not much unlike that of a frog: at the end there is a hole on each side for the nostrils; but there are no ears, nor any sign of any.

The jaws are furnished with teeth, or rather with a bone in the form of teeth, which he makes little or no use of, because he lives upon swallowing flies and other insects without chewing them; and hence arose the vulgar notion of his living upon air, because he was never seen to eat. The tongue, which Linnaeus says resembles an earthworm, is of considerable length, and is enlarged and somewhat flattened at the end. From this member there continually oozes out a very glutinous liquor, by means of which it catches such insects as come within its reach, and it is surprising to see with what quickness it retracts its tongue the instant it has arrested any prey. The form, struc-

ture, and motion of the eyes, have something very particular; for they are very large, being almost half an inch in diameter. They are of a globous figure; which may be easily seen, because they stand out of the head. They have a single eye-lid like a cap, with a small hole in the middle, through which the sight of the eye appears, no bigger than a pin's head, and of a shining brown, encircled by a little ring of a gold colour. This eye-lid has a grain like shagreen, as well as the other parts of the skin; and when the rest of the body changes colour, and assumes spots of different shapes, those on the lid always keep the same form, though they are tintured with the same colour as the skin. But the most extraordinary thing relating to the eyes is, that this animal often moves one when the other is entirely at rest; nay, sometimes one eye will seem to look directly forward and the other backward, and one will look up to the sky when the other regards the earth.

That part of the body which is called the *trunk*, and comprehends the thorax and the belly in a chameleon, is almost all thorax, with little or no belly. The four feet are all of a length; and the only difference between them is, that those before are turned backwards, and those behind forwards. There are five toes on each paw, which have a greater resemblance to hands than feet. They are all divided into two, which gives the appearance of two hands to each arm, and two feet to each leg; and though one of these parts have three toes, and the other but two, yet they seem to be all of the same size. These toes lie together under the same skin as in a mitten; however, their shape might be seen through the skin. With these paws the chameleon can lay hold of the small branches of trees in the same manner as a parrot. When he is about to perch, he parts his toes differently from birds, because he puts two behind and two before. The claws are little, crooked, very sharp, and of a pale yellow, proceeding but half way out of the skin, while the other half is hid beneath it. His walk is slower than that of a tortoise, and he seems to move along with an affectation of gravity. He seems to seek for a proper place to set his feet upon; and when he climbs up trees, he does not trust to his feet like squirrels, but endeavours to find out clefts in the bark, that he may get a surer hold.

His tail is like that of a viper when it is puffed up and round; for otherwise the bones may be seen in the same manner as on the back. He always wraps his tail round the branches of trees, and it serves him as it were instead of a fifth hand.—He is a native of Africa and Asia. Mr Hasselquist is of opinion, that the change of colour in the chameleon is owing to its being exceedingly subject to the jaundice, which particularly happens either when it is exposed to the sun or when it is made angry. The mixture of the bile with its blood is then very perceptible, and, as the skin is transparent, makes it spotted with green and yellow. He never saw it coloured with red, blue, or purple; and does not believe that ever it assumes these colours.

9. The gecko, has a cylindrical tail, concave ears, and a warty body. It is the Indian salamander or Bontius. "This animal is very frequent in Cairo (says Hasselquist), both in the houses and without them. The poison of this animal is very singular, as it exhales from the lobuli of the toes. The animal  
feels

I.acerta.

seeks all places and things impregnated with sea-salt, and, passing over them several times, leaves this very noxious poison behind it. In July 1750, I saw two women and a girl in Cairo at the point of death, from eating cheese new salted, bought in the market, and on which this animal had dropt its poison. Once at Cairo, I had an opportunity of observing how acrid the exhalations of the toes of this animal are, as it ran over the hand of a man who endeavoured to catch it; there immediately rose little pustules over all those parts the animal had touched: these were red, inflamed, and smarted a little, greatly resembling those occasioned by the stinging of nettles. It emits an odd sound, especially in the night, from its throat, not unlike that of a frog."

10. The scincus has a cylindrical tail compressed at the point, and blunt marginated toes. This animal is found in Arabia Petæa near the Red Sea, and in Upper Egypt near the Nile. It is much used by the inhabitants of the east as an aërodissiac, but not at this time by the Europeans. The flesh of the animal is given in powder, with some stimulating vehicle; broth made of the recent flesh is likewise used by the Arabs. It is brought from Upper Egypt and Arabia to Alexandria, whence it is carried to Venice and Marseilles, and from thence to all the apothecaries shops of Europe.

11. The nilotica has a long tail with a triangular edge, and four lines of scales on the back. It is met with in the moist places of Egypt near the Nile. The Egyptians say that this lizard proceeds from the eggs of the crocodile laid in the sand, but that the crocodile proceeds from those laid in the water. Mr Hæselquist hath detected the fallacy of this account.

12. The palustris has a lanceolated tail, and four toes on the fore-feet, and inhabits the stagnating waters of Europe. It has a slow and crawling pace. Mr Pennant mentions his having more than once found, under stones and old logs, some very minute lizards that had much the appearance of this kind: they were perfectly formed, and had not the least vestiges of fins; which circumstance, joined to their being found in a dry place remote from water, seems to indicate, that they had never been inhabitants of that element, as it is certain many of our lizards are in their first state. At that period they have a fin above and below their tail; that on the upper part extends along the back as far as the head; but both drop off as soon as the animal takes to the land, being then no longer of any use. Mr Ellis has remarked certain pennated fins at the gills of one very common in most of our stagnating waters, and which is frequently observed to take a bait like a fish.

13. The salamandra, or salamander, has a short cylindrical tail, four toes on the fore-feet, and a naked porous body. This animal has been said, even in the Philosophical Transactions, to live in the fire; but this is found to be a mistake. It is found in the southern countries of Europe. The following account of this species is extracted from the Count de la Cèpede's Natural History of Serpents. Whilst the hardest bodies cannot resist the violence of fire, the world have endeavoured to make us believe that a small lizard can not only withstand the flames, but even extinguish them. As agreeable fables readi-

ly gain belief, every one has been eager to adopt that of a small animal so highly privileged, so superior to the most powerful agent in nature, and which could furnish so many objects of comparison to poetry, so many pretty emblems to love, and so many brilliant devices to valour. The ancients believed this property of the salamander, wishing that its origin might be as surprising as its power: and being desirous of realizing the ingenious fictions of the poets, they have pretended that it owes its existence to the purest of elements, which cannot consume it; and they have called it the daughter of fire, giving it however a body of ice. The moderns have followed the ridiculous tales of the ancients; and as it is difficult to stop when one has passed the bounds of probability, some have gone so far as to think that the most violent fire could be extinguished by the land salamander. Quacks sold this small lizard, affirming, that when thrown into the greatest conflagration, it would check its progress. It was very necessary that philosophers and naturalists should take the trouble to prove by facts what reason alone might have demonstrated; and it was not till after the light of science was diffused abroad, that the world gave over believing in this wonderful property of the salamander. This lizard, which is found in so many countries of the ancient world, and even in very high latitudes, has been however very little noticed, because it is seldom seen out of its hole, and because for a long time it has inspired much terror. Even Aristotle speaks of it as of an animal with which he was scarcely acquainted.

One of the largest of this species, preserved in the French king's cabinet, is seven inches five lines in length, from the end of the muzzle to the root of the tail, which is three inches eight lines. The skin does not appear to be covered with scales, but it is furnished with a number of excrescences like teats, containing a great many holes, several of which may be very plainly distinguished by the naked eye, and through which a kind of milk oozes, that generally spreads itself in such a manner as to form a transparent coat of varnish above the skin of this oviparous quadruped, naturally dry.

The eyes of the salamander are placed in the upper part of the head, which is a little flattened; their orbit projects into the interior part of the palate, and is there almost surrounded by a row of very small teeth, like those in the jaw-bones: these teeth establish a near relation between lizards and fishes; many species of which have also several teeth placed in the bottom of the mouth. The colour of this lizard is very dark: upon the belly it has a bluish cast, intermixed with pretty large irregular yellow spots, which extend over the whole body, and even to the feet and eye-lids; some of these spots are besprinkled with small black specks; and those which are upon the back often touch without interruption, and form two long yellow bands. The colour must, however, be subject to vary; and it appears that some salamanders are found in the marshy forests of Germany, which are quite black above and yellow below. To this variety we must refer the black salamander, found by Mr Laurenti in the Alps, which he considered as a distinct species.

The salamander has no ribs; neither have frogs, to which it has a great resemblance in the general form

of

of the anterior part of its body. When touched, it suddenly covers itself with that kind of coat of which we have spoken, and it can also very rapidly change its skin from a state of humidity to a state of dryness. The milk which issues from the small holes in its surface is very acrid; when put upon the tongue one feels as it were a kind of fear at the part which it touched. This milk, which is considered as an excellent substance for taking off hair, has some resemblance to that which distils from those plants called esula and euphorbium. When the salamander is crushed, or when it is only pressed, it exhales a bad smell, which is peculiar to it.

Salamanders are fond of cold damp places, thick shades, tufted woods, or high mountains, and the banks of streams that run through meadows; they sometimes retire in great numbers to hollow trees, hedges, and below old rotten stumps; and they pass the winter in places of high latitude, in a kind of burrows, where they are found collected, several of them being joined and twisted together. The salamander being destitute of claws, having only four toes on each of the fore feet, and no advantage of conformation making up its deficiencies, its manner of living must, as is indeed the case, be very different from that of other lizards. It walks very slowly; far from being able to climb trees with rapidity, it often appears to drag itself with great difficulty along the surface of the earth. It seldom goes far from the place of shelter which it has fixed on; it passes its life under the earth, often at the bottom of old walls during summer; it dreads the heat of the sun, which would dry it; and it is commonly only when rain is about to fall that it comes forth from its secret asylum, as if by a kind of necessity, to bathe itself, and to imbibe an element to which it is analogous. Perhaps it finds then with greatest facility those insects upon which it feeds. It lives upon flies, beetles, snails, and earth-worms; when it repose, it rolls up its body in several folds like serpents. It can remain some time in the water without danger, and it casts a very thin pellicle of a greenish grey colour. Salamanders have even been kept more than six months in the water of a well without giving them any food; care only was taken to change the water often.

It has been remarked, that every time a salamander is plunged into the water, it attempts to raise its nostrils above the surface as if to seek for air, which is a new proof of the need that all oviparous quadrupeds have to breathe during the time they are not in a state of torpor. The salamander has apparently no ears, and in this it resembles serpents. It has even been pretended that it does not hear, and on this account it has got the name of *Jourd* in some provinces of France. This is very probable, as it has never been heard to utter any cry, and silence in general is coupled with deafness.

Having then perhaps one sense less than other animals, and being deprived of the faculty of communicating its sensations to those of the same species, even by imperfect sounds, it must be reduced to a much inferior degree of instinct: it is therefore very stupid; and not bold, as has been reported: it does not brave danger, as is pretended, but it does not perceive it. Whatever gestures one makes to frighten it, it always

advances without turning aside; however, as no animal is deprived of that sentiment necessary for its preservation, it suddenly compresses its skin, as is said, when tormented, and spurts forth upon those who attack it that corrosive milk which is under it. If beat, it begins to raise its tail: afterwards it becomes motionless, as if stunned by a kind of paralytic stroke; for we must not, with some naturalists, ascribe to an animal so devoid of instinct, so much art and cunning as to counterfeit death. It shorn, it is difficult to kill it; but when dipped in vinegar, or surrounded with salt reduced to powder, it expires in convulsions, as is the case with several other lizards and worms.

It seems one cannot allow a being a chimerical quality, without refusing it at the same time a real property. The cold salamander has been considered as an animal endued with the miraculous power of resisting, and even of extinguishing, fire; but at the same time, it has been debased as much as elevated by this singular property. It has been made the most fatal of animals: the ancients, and even Pliny, have devoted it to a kind of anathema, by affirming that its poison is the most dangerous of all. They have written, that infecting with its poison almost all the vegetables of a large country, it might cause the destruction of *whole nations*. The moderns also for a long time believed the salamander to be very poisonous; they have said, that its bite is mortal, like that of the viper; they have sought out and prescribed remedies for it; but they have at length had recourse to observations, by which they ought to have begun. The famous Bacon wished naturalists would endeavour to ascertain the truth respecting the poison of the salamander. Gesner proved by experiments that it did not bite, whatever means were used to irritate it; and Wurfbauius showed that it might safely be touched, and that one might without danger drink the water of those wells which it inhabited. M. de Maupertuis studied also the nature of this lizard. In making researches to discover what might be its pretended poison, he demonstrated experimentally, that fire acted upon the salamander in the same manner as upon all other animals. He remarked, that it was scarcely upon the fire, when it appeared to be covered with the drops of its milk, which rarified by the heat, issued through all the pores of the skin, but in greater quantity from the head and dug, and that it immediately became hard. It is needless to say, that this milk is not sufficiently abundant to extinguish even the smallest fire. M. de Maupertuis, in the course of his experiments, in vain irritated several salamanders: none of them ever opened their mouths; he was obliged to open them by force. As the teeth of this lizard are very small, it was very difficult to find an animal with a skin sufficiently fine to be penetrated by them: he tried without success to force them into the flesh of a chicken stripped of its feathers; he in vain pressed them against the skin: they were displaced, but they could not enter. He however made a salamander bite the thigh of a chicken, after he had taken off a small part of the skin. He made salamanders newly caught bite also the tongue and lips of a dog, as well as the tongue of a turkey; but none of these animals received the least injury. M. de Maupertuis afterwards made a dog and a turkey swallow salamanders whole, or cut into pieces; and yet

Lacerta.

neither of them appeared to be sensible of the least uneasiness.—Mr Laurenti since made experiments with the same view: he forced grey lizards to swallow the milk proceeding from the salamander, and they died very suddenly. The milk, therefore, of the salamander, taken internally, may hurt, and even be fatal to certain animals, especially those which are small; but it does not appear to be hurtful to large animals.

It was long believed that the salamander was of no sex; and that each individual had the power of engendering its like, as several species of worms. This is not the most absurd fable which has been imagined with respect to the salamander; but if the manner in which they come into the world is not so marvellous as has been written, it is remarkable in this, that it differs from that in which most other lizards are brought forth, as it is analogous to that in which the chalcide and the seps, as well as vipers and several kinds of serpents, are produced. On this account the salamander merits the attention of naturalists much more than on account of the false and brilliant reputation which it has so long enjoyed. M. de Maupertuis having opened some salamanders, found eggs in them, and at the same time some young perfectly formed; the eggs were divided into two long bunches like grapes, and the young were enclosed in two transparent bags; they were equally well formed as the old ones, and much more active. The salamander, therefore, brings forth young from an egg hatched within its belly as the viper; and her fecundity is very great: naturalists have long written that she has forty or fifty at one time; and M. de Maupertuis found 42 young ones in the body of a female salamander, and 54 in another.

The young salamanders are generally of a black colour, almost without spots; and this colour they preserve sometimes during their whole lives in certain countries, where they have been taken for a distinct species, as we have said. Mr Thunberg has given, in the Memoirs of the Academy of Sweden, the description of a lizard, which he calls the *Japanese lizard*, and which appears not to differ from our salamander but in the arrangement of its colours. This animal is almost black, with several whitish and irregular spots, both on the upper part of the body and below the paws; on the back there is a strip of dirty white, which becomes narrower to the point of the tail. This whitish stripe is interspersed with very small specks which form the distinguishing characteristic of our land salamander. We are of opinion, therefore, that we may consider this Japanese lizard, described by Mr Thunberg, as a variety of the species of our land salamander, modified a little, perhaps, by the climate of Japan. It is in the largest island of that empire, named *Nippon*, that this variety is found. It inhabits the mountains there, and rocky places. The Japanese consider it as a powerful stimulant, and a very active remedy; and on this account, in the neighbourhood of Jedo, a number of these Japanese salamanders may be seen dried, hanging from the ceiling of the shops.

14. The basiliskus, has a long cylindrical tail, a radiated fin on the back, and a crest on the throat. It is a native of the Indies. It is a very harmless creature; and altogether destitute of those wonderful qualities

N<sup>o</sup> 173.

which have been attributed to the fabulous animal of the same name. See the article *BASILISK*.

15. The *sex-lineata*, or lion-lizard, is about six inches long; the body of a grey colour, marked lengthwise on each side with three whitish lines: the legs are long; and it has a very long tail, which it curls up, looking fierce at the same time, whence probably it has received its English name. It inhabits South Carolina and the greater Antilles. It is very inoffensive, and remarkably agile; but is a prey to rapacious birds.

16. The *green lizard* of Carolina is so denominated from its colour. This species is very slender; the tail is near double the length of the body, and the whole length about five inches. It inhabits Carolina; where it is domestic, familiar, and harmless. It sports on tables and windows, and amuses with its agility in catching flies. Cold affects the colours: in that uncertain climate, when there is a quick transition in the same day from hot to cold, it changes instantly from the most brilliant green to a dull brown. They are a prey to cats and ravenous birds. They appear chiefly in summer; and at the approach of cold weather they retire to their winter recesses, and lie torpid in the hollows and crevices of rotten trees. It frequently happens that a few warm sunshiny days so invigorate them, that they will come out of their holes and appear abroad; when on a sudden the weather changing to cold, so enfeebles them, that they are unable to return to their retreats, and will die of cold.

17. The *iguana*, or *guana*, with the top of the back and tail strongly serrated, and the gullet serrated in the same manner, is sometimes found to be five feet long. It has small teeth, and will bite hard. It inhabits the rocks of the Bahama islands, and lurks in cliffs or hollow trees. It feeds entirely on vegetables and fruits; and the fat of the abdomen assumes the colour of that which it has last eaten. It is slow of motion, and has a most disgusting look; yet it is esteemed a most delicate and wholesome food, noxious only to venereal patients, according to Linnæus. It is not amphibious, yet on necessity will continue long under water; it swims by means of the tail, keeping its legs close to the body. Guanans are the support of the natives of the Bahama islands, who go in their sloops from rock to rock in search of them. They are taken with dogs trained for the purpose; and as soon as caught, their mouths are sewed up, to prevent them from biting. Some are carried alive for sale to Carolina; others salted and barrelled for home-consumption.

18. The *bullaris*, or green lizard of Jamaica, is about six inches long, of a shining grass-green colour. It is common in Jamaica, frequenting hedges and trees. When approached to, these animals, by filling their throat with wind, swell it into a globular form with a scarlet colour; which, when contracted, the scarlet disappears, and the part returns to the colour of the rest of the body. The figure represents the animal with its throat thus inflated. This swelling action seems to proceed from menacing, or deterring one from coming near them, though they are very inoffensive.

19. The *muricata*, or prickly lizard, has a long rounded tail; its body, which is of a brownish grey colour, is covered with sharp-pointed scales, and the whole

*Crocon*

*Wallon. Mal. sulph. p. 101*

whole upper part marked with transverse dusky bars. The scales are furnished with a prominent line on the upper surface, and toward the back part of the head almost run into a sort of weak spines.

20. The laticauda, or broad-tailed lizard, has a flattened lanceolate tail, somewhat spiny on the margin. It is about four inches and a half in length. The head is disproportionately large. The upper surface of the body is of a dusky grey colour, and beset with small tubercles, which in some parts sharpen to a point. The colour of the under surface of the body is pale, or almost white. This and the preceding species are inhabitants of New South Wales.

There are above 60 other species of this genus; two of which, the *seps* and *chalcides*, being very different from the other species, and approaching in form to the serpent tribe, figures of them are added in the Plates. A similar species is the *bipes*, transferred to this genus, in the last edition of the *Système Naturel*, from the *Anguis* of former editions, where it was called the *anguis bipes*. See *ANGUIS*.

LACHES, (from the French *lâcher*, i. e. *laxare*, or *lâche*, *ignavus*), in the English law signifies slackness or negligence, as it appears in Littleton, where *laches of entry* is a neglect of the heir to enter. And probably it may be an old English word: for where we say there is *laches* of entry, it is all one as if it were said there is a *lack* of entry; and in this signification it is used. No *laches* shall be adjudged in the heir within age; and regularly, *laches* shall not bar infants or femme covert for not entry or claim, to avoid descents; but *laches* shall be accounted in them for non-performance of a condition annexed to the state of the land.

LACHESIS, in mythology, one of the Paræ. Her name is derived from *λαχίσις*, to measure out by lot. She presided over futurity, and was represented as spinning the thread of life, or, according to others, holding the spindle. She generally appeared covered with a garment variegated with stars, and holding spindles in her hand.

LACHISH, (anc. geog.) a city southward of the tribe of Judah. Eusebius and St Jerom tell us, that in their time there was a village called *Lachish*, seven miles from Eleutheropolis, southward. Sennacherib besieged Lachish, but did not take it. From thence it was that he sent Rabshakeh against Jerusalem. Here King Amaziah was slain by his rebel subjects.

LACHNEA, in botany: A genus of the monogynia order, belonging to the octandria class of plants; and in the natural method ranking under the 31st order, *Veprecule*. There is no calyx; the corolla is quadrifid with the limb unequal; there is one seed a little resembling a berry.

LACHRYMAL, in anatomy, an appellation given to several parts of the eye. See *ANATOMY*, p. 766. col. 1.

LACHRYMATORY, in antiquity, a vessel where-in were collected the tears of a deceased person's friends, and preserved along with the ashes and urn. They were small glass or earthen bottles, chiefly in the form of phials. At the Roman funerals, the friends of the deceased, or the *præfica*, women hired for that purpose, used to fill them with their tears, and deposit them very carefully with the ashes in testimony of their

forrow, imagining the manes of the deceased were thereby greatly comforted. Many specimens of them are preserved in the cabinets of the curious, particularly in the British Museum.

LACINIUM (anc. geog.), a noble promontory of the Brutii in Italy, the south boundary of the Sinus Tarentinus and the Adriatic; all to the south of it being deemed the Ionian Sea: it was famous for a rich temple of Juno, surnamed *Lacinia*, with a pillar of solid gold standing in it; which Hannibal intending to carry off, was, according to Cicero, dissuaded by a dream. Now *Capo delle Colonne*, from the columns of Juno's temple still standing on the north-east coast of the Calabria ultra.

LACK OF RUPEES, is 100,000 rupees; which, supposing them standard, or siccas, at 2s. 6d. amounts to 12,500l. Sterling.

LACONIA, or LACONICA, a country on the southern parts of Peloponnesus, having Argos and Arcadia on the north, Messenia on the west, the Mediterranean on the south, and the bay of Argos at the east. Its extent from north to south was about 50 miles. It was watered by the river Eurotas. The capital was called Sparta, or Lacedæmon: (See *LACEDÆMON* and *SPARTA*.) The brevity with which the Laconians always expressed themselves is now become proverbial; and by the epithet of *Laconic*, we understand whatever is concise, and is not loaded with unnecessary words.

LACONICUM, (whence our term *laconic*), a short pithy sententious speech, such as the Lacedæmonians were remarkable for: Their way of delivering themselves was very concise, and much to the purpose. See the preceding article.

LACQUERS, are varnishes applied upon tin, brass, and other metals, to preserve them from tarnishing, and to improve their colour. The basis of lacquers is a solution of the resinous substance called *seed lac*, in spirit of wine. The spirit ought to be very much dephlegmated, in order to dissolve much of the lac. For this purpose, some authors directly dry potash to be thrown into the spirit. This alkali attracts the water, with which it forms a liquid that subsides distinctly from the spirit at the bottom of the vessel. From this liquid the spirit may be separated by decantation. By this method the spirit is much dephlegmated; but, at the same time, it becomes impregnated with part of the alkali, which depraves its colour, and communicates a property to the lacquer of imbibing moisture from the air. These inconveniences may be prevented by distilling the spirit; or, if the artist has not an opportunity of performing that process, he may cleanse the spirit in a great measure from the alkali, by adding to it some calcined alum; the acid of which uniting with the alkali remaining in the spirit, forms with it a vitriolated tartar, which, not being soluble in spirit of wine, falls to the bottom together with the earth of the decomposed alum. To a pint of the dephlegmated and purified spirit, about three ounces of powdered shell-lac are to be added; and the mixture to be digested during some day with a moderate heat. The liquor ought then to be poured off, strained, and cleared by settling. This clear liquor is now fit to receive the required colour from certain resinous colouring substances, the

Lacinia  
||  
Lacquers.

*Lacccio.* principal of which are gamboge and annotto; the former of which gives a yellow, and the latter an orange colour. In order to give a golden colour, two parts of gamboge are added to one of annotto; but these colouring substances may be separately dissolved in the tincture of lac, and the colour required may be adjusted by mixing the two solutions in different proportions. When silver leaf or tin are to be lacquered, a larger quantity of the colouring materials are requisite than when the lacquer is intended to be laid on brass.

*Motherly's  
Medical  
Dictionary.*

LACTATIO, LACTATION, among medical writers, denotes the *giving suck*. The mother's breast, if possible, should be allowed the child, at least during the first month; for thus the child is more peculiarly benefited by what it sucks, and the mother is preserved from more real inconveniences than the falsely delicate imagine they would suffer by compliance herewith: but if by reason of an infirm constitution, or other causes, the mother cannot suckle her child, let dry nursing under the mother's eye be pursued.

When women lose their appetite by giving suck, both the children and themselves are thereby injured; wet nurses are to be preferred, who, during the time they give the breast, have rather an increased appetite, and digest more quickly; the former are apt to waste away, and sometimes die consumptive. In short, those nurses with whom lactation may for a while agree, should wean the child as soon as their appetite lessens, their strength seems to fail, or a tendency to hysterical symptoms are manifest.

When the new-born child is to be brought up by the mother's breast, apply it thereto in ten or twelve hours after delivery; thus the milk is sooner and more easily supplied, and there is less hazard of a fever than when the child is not put to it before the milk begins to flow of itself.

If the mother does not suckle her child, her breasts should be so kept warm with flannels, or with a hare-skin, that a constant perspiration may be supported; thus there rarely will arise much inconvenience from the milk.

The child, notwithstanding all our care in dry nursing, sometimes pines if a breast is not allowed. In this case a wet nurse should be provided, if possible one that hath not been long delivered of a child. She should be young, of a healthy habit, and an active disposition, a mild temper, and whose breasts are well filled with milk. If the milk is good, it is sweetish to the taste, and totally free from saltness; to the eye it appears thin, and of a bluish cast. That the woman hath her menses, if in other respects objections are not made, this need not be any; and as to the custom with many, of abstaining from venery while they continue to suckle a child, it is so far without reason to support it, that the truth is, a rigorous chastity is as hurtful, and often more pernicious, than an immoderate use of venery. Amongst the vulgar errors, is that of red-haired women being improper for wet nurses.

If the menses do not appear during the first months, but after six or eight months suckling they begin to descend, the child should be weaned.

Wet nurses should eat at least one hearty meal of animal-food every day; with this a proper quantity of vegetables should be mixed. Thin broth or milk are

proper for their breakfasts and their suppers; and if the strength should seem to fail a little, a draught of good ale should now and then be allowed: but spirituous liquors must in general be forborne; not but a spoonful of rum may be allowed in a quart of milk and water, (*i. e.* a pint of each), which is a proper common drink.

Though it is well observed by Dr Hunter, that the far greater number of those women who have cancers in the breast or womb are old maids, and those who refuse to give suck to their children; yet it is the unhappiness of some willing mothers not to be able: for instance, those with tender constitutions, and who are subject to nervous disorders; those who do not eat a sufficient quantity of solid food, nor enjoy the benefit of exercise and air: if children are kept at their breasts, they either die whilst young, or are weak and sickly after childhood is past, and so on through remaining life.

LACTANTIUS, (Lucius Coelius Firmianus), a celebrated author at the beginning of the 4th century, was, according to Baronius, an African; but, according to others, was born at Fermo in the marquisate of Ancona, from whence it is imagined he was called *Firmianus*. He studied rhetoric under Arnobius; and was afterwards a professor of that science in Africa and Nicomedia, where he was so admired, that the emperor Constantine chose him preceptor to his son Crispus Caesar. Lactantius was so far from seeking the pleasures and riches of the court, that he lived there in poverty, and, according to Eusebius, frequently wanted necessaries. His works are written in elegant Latin. The principal of which are, 1. *De ira divina*. 2. *De operibus Dei*, in which he treats of the creation of man, and of divine providence. 3. *Divine Institutions*, in seven books. This is the most considerable of all his works: he there undertakes to prove the truth of the Christian religion, and to refute all the difficulties that had been raised against it; and he solidly, and with great strength, attacks the illusions of paganism. His style is pure, clear, and natural, and his expressions noble and elegant, on which account he has been called the *Cicero of the Christians*. There is also attributed to him a treatise *De morte persecutorum*; but several of the learned doubt its being written by Lactantius. The most copious edition of Lactantius's works is that of Paris in 1748, 2 vols 4to.

LACTEALS, or LACTEAL VESSELS, a kind of long slender tubes for the conveyance of the chyle from the intestines to the common reservoir. See ANATOMY, n<sup>o</sup> 105.

LACTIFEROUS, an appellation given to plants abounding with a milky juice, as the sow-thistle and the like. The name of *lactiferous*, or *lactescent*, is given to all those plants which abound with a thick-coloured juice, without regarding whether it is white or not. Most lactiferous plants are poisonous, except those with compound flowers, which are generally of an innocent quality.

Of the poisonous lactescent plants the most remarkable are fumach, agaric, maple, burning thorny plant, cassida, celandine, puccoon, prickly poppy, and the plants of the natural order *contorta*, as swallow-wort, apocynum, cynanchum, and cerbera.

The bell-shaped flowers are partly noxious, as cardinal flower; partly innocent, as campanula.

Among

Among the lactescent plants with compound flowers that are innocent in their quality, may be mentioned dandelion, picris, hyoseris, wild lettuce, gum-fucory, hawk-weed, bastard hawk weed, hypocheris, goat's-beard, and most species of lettuce: we say most species, because the prickly species of that genus are said to be of a very virulent and poisonous nature; though Mr Lightfoot denies this, and affirms that they are a safe and gentle opiate, and that a syrup made from the leaves and stalks is much preferable to the common diacodium.

**LACTUCA**, in botany: A genus of the polygamia æqualis order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The receptacle is naked; the calyx imbricated, cylindrical, with a membranaceous margin; the pappus is simple, stipated, or stalked. There are several species, most of which are plants of no use, and never cultivated but in botanic gardens for variety. Those commonly cultivated in the kitchen-garden for use, are, 1. The common or garden lettuce. 2. Cabbage lettuce. 3. Silesia lettuce. 4. Dutch brown lettuce. 5. Aleppo lettuce. 6. Imperial lettuce. 7. Green capuchin lettuce. 8. Versailles or upright white Cos lettuce. 9. Black Cos. 10. Red Cos. 11. Red capuchin lettuce. 12. Roman lettuce. 13. Prince lettuce. 14. Royal lettuce. 15. Egyptian Cos lettuce.

*Culture, &c.* The first of these sorts is very common in all gardens, and is commonly sown for cutting very young, to mix with other salad herbs in spring; and the second, or cabbage lettuce, is only this mended by culture. It may be sown at all times of the year, but in the hot months requires to be sown in shady borders. The cabbage-lettuce may also be sown at different seasons, to have a continuation of it through the summer. The first crop should be sown in February, in an open situation; the others at three weeks distance; but the later ones under covert, but not under the drippings of trees. The Silesia, imperial, royal, black, white, and upright Cos lettuces, may be first sown in the latter end of February or the beginning of March, on a warm light soil, and in an open situation; when the plants are come up, they must be thinned to 15 inches distance every way, they will then require no farther care than the keeping them clear of weeds; and the black Cos, as it grows large, should have its leaves tied together to whiten the inner part. Succeeding crops of these should be sown in April, May, and June; and toward the latter end of August they may be sown for a winter crop, to be preserved under glasses, or in a bed arched over with hoops and covered with mats. The most valuable of all the English lettuces are the white Cos or the Versailles, the Silesia, and the black Cos. The brown Dutch and the green capuchin are very hardy, and may be sown late under walls, where they will stand the winter, and be valuable when no others are to be had. The red capuchin, Roman, and prince lettuce, are very early kinds, and are sown for variety; as are also the Aleppo ones for the beauty of their spotted leaves.

*Properties.* The several sorts of garden lettuces are very wholesome, emollient, cooling salad herbs, easy of digestion, and somewhat loosening the belly. Most

writers suppose that they have a narcotic quality; and indeed in many cases they contribute to procure rest; this they effect by abating heat, and relaxing the fibres. The feeds are in the number of the four lesser cold feeds.

The virofa, or strong-scented wild lettuce, which is indigenous in Britain, and grows in some places in considerable abundance, differs very essentially in its qualities from the garden lettuce. Although it has not been introduced into any of the modern pharmacopœias, yet it has of late been highly extolled for some purposes in medicine. It smells strongly of opium, and resembles it in some of its effects; and its narcotic power, like that of the poppy heads, resides in its milky juice. An extract from the expressed juice is recommended in small doses in dropsy. In dropsies of long standing, proceeding from visceral obstructions, it has been given to the extent of half an ounce a-day. It is said to agree with the stomach, to quench thirst, to be gently laxative, powerfully diuretic, and somewhat diaphoretic. Plentiful dilution is allowed during its operation. Dr Collin of Vienna asserts, that out of 24 dropical patients, all but one were cured by this medicine.

**LACUNÆ**, among anatomists, certain excretory canals in the genital parts of women.

**LACUNAR**, in architecture, an arched roof or ceiling, more especially the planking or flooring above porticos or piazzas.

**LACYDES**, a Greek philosopher, born at Cyrene, was the disciple of Arcefilaus, and his successor in the academy. He taught in a garden given him by Attalus king of Pergamus; but that prince sending for him to court, he replied, "That the pictures of kings should be viewed at a distance." He imitated his master in the pleasure he took in doing good without caring to have it known: he had a goose which followed him every where by night as well as by day; and when she died, he made a funeral for her, which was as magnificent as if it had been for a son or a brother. He taught the same doctrine as Arcefilaus; and pretended that we ought to determine nothing, but always to suspend our opinion. He died 212 B. C.

**LADDER**, a frame made with a number of steps, by means of which people may ascend as on a stair to places otherwise inaccessible.

*Scaling LADDERS*, in the military art, are used in scaling when a place is to be taken by surprize. They are made several ways: here we make them of flat staves, so that they may move about their pins, and shut like a parallel ruler, for conveniently carrying them: the French make them of several pieces, so as to be joined together, and to be made of any necessary length: sometimes they are made of single ropes, knotted at proper distances, with iron hooks at each end, one to fasten them upon the wall above, and the other in the ground; and sometimes they are made with two ropes, and staves, between them, to keep the ropes at a proper distance, and to tread upon. When they are used in the action of scaling walls, they ought to be rather too long than too short, and to be given in charge only to the stoutest of the detachment. The soldiers should carry these ladders with the left arm passed through the second step, taking care to hold them upright close to their sides, and

Lacuna  
||  
Ladder.

Laden very short below, to prevent any accident in leaping into the ditch.

Ladogna.

The first rank of each division, provided with ladders, should set out with the rest at the signal, marching resolutely with their firelocks slung, to jump into the ditch; when they are arrived, they should apply their ladders against the parapet, observing to place them towards the salient angles rather than the middle of the curtain, because the enemy have less force there. Care must be taken to place the ladders within a foot of each other, and not to give them too much nor too little slope, so that they may not be overturned or broke with the weight of the soldiers mounting upon them.

The ladders being applied, they who have carried them, and they who come after, should mount up, and rush upon the enemy sword-in hand: if he who goes first, happens to be overturned, the next should take care not to be thrown down by his comrade; but, on the contrary, immediately mount himself, so as not to give the enemy time to load his piece.

As the soldiers who mount first may be easily tumbled over, and their fall may cause the attack to fail, it would perhaps be right to protect their breasts with the fore parts of cuirasses; because, if they can penetrate, the rest may easily follow.

The success of an attack by scaling is infallible, if they mount the four sides at once, and take care to shower a number of grenades amongst the enemy, especially when supported by some grenadiers and picquets, who share the attention and fire of the enemy.

LADEN, in the sea-language, the state of a ship when she is charged with a weight or quantity of any sort of merchandises, or other materials, equal to her tonnage or burden. If the cargo with which she is laden is extremely heavy, her burden is determined by the weight of the goods; and if it is light, she carries as much as she can *float*, to be fit for the purposes of navigation. As a ton in measure is generally estimated at 2000 lb. in weight, a vessel of 200 tons ought accordingly to carry a weight equal to 400,000 lb. when the matter of which the cargo is composed is specifically heavier than the water in which she floats; or, in other words, when the cargo is so heavy that she cannot float high enough with so great a quantity of it as her hold will contain.

LADEN in Bulk, the state of being freighted with a cargo which is neither in casks, boxes, bales, nor cases, but lies loose in the hold; being defended from the moisture or wet of the hold, by a number of mats and a quantity of *dunage*. Such are usually the cargoes of corn, salt, or such materials.

LADENBURG, a town of Germany in the Palatinate of the Rhine, seated on the river Neckar, in E. Long. 8. 42. N. Lat. 49. 27. It belongs to the bishopric of Worms, and the elector Palatine.

LADISLAUS, the name of several kings of Poland. See POLAND.

LADOGA, a town of the Russian empire, seated on a great lake of the same name, which has a communication with the gulf of Finland, by the river Nieva; and it abounds in fish, particularly salmon. E. Lon. 33. 29. N. Lat. 60. 0.

LADOGNA, or LACEDOGNA, a town of Italy, in the kingdom of Naples, and in the Capitanata,

with a bishop's see. E. Long. 15. 12. N. Lat. 41. 16.

LADON (anc. geog.) a river of Arcadia falling into the ALPHEUS. The metamorphosis of Daphne into a laurel, and of Syrinx into a reed happened near its banks.

LADRONE or MARIAN islands, a cluster of twelve islands lying in the Pacific Ocean, in about 145° of east longitude, and between the 11th and 21st degree of north latitude. They were first discovered by Magellan, who sailed round the world through the Straits which bear his name. He gave them the name of *Ladrone Islands*, or the *Islands of Thieves*, from the thievish disposition of the inhabitants. At the time these islands were discovered by the Europeans, the natives were totally unacquainted with any other country besides their own; and having no traditionary accounts of their own origin, they imagined that the author of their race was formed of a piece of the rock of Funu, one of their smallest islands. Many things looked upon by us as absolutely necessary to our existence, were utterly unknown to these people. They had no animals of any sort; and would not even have had any idea of them, had it not been for the birds; and even of them they had but one species, somewhat like the turtle dove, which they never killed for eating, but only tamed them, and taught them to speak. They were much astonished on seeing a horse which a Spanish captain left among them in 1673, and could not for a long time be satisfied with admiring him. But what is most surprising and incredible in their history is, that they were utterly unacquainted with the element of fire till Magellan, provoked by their repeated thefts, burned one of their villages. When they saw their wooden houses blazing, they first thought that the fire was a beast which fed upon the wood; and some of them who came too near, being burnt, the rest stood at a distance, lest they should be devoured or poisoned by the breathings of this terrible animal.

The inhabitants of the Ladrone islands are olive-coloured, but not of such a deep dye as those of the Philippine islands; their stature is good, and their limbs well proportioned. Though their food consists entirely of fish, fruits, and roots, yet they are so fat, that strangers they appear swelled, but this does not render them less nimble and active. They often live to 100 years or more, yet retain the health and vigour of men of 50. The men go stark naked, but the women are covered. They are not ill-looking, and take great care of their beauty, though their ideas on that subject are very different from ours. They love black teeth and white hair. Hence one of their principal occupations is to keep their teeth black by the help of certain herbs, and to whiten their hair, sprinkling upon it a certain water for this purpose. The women have their hair very long; but the men generally shave it close, except a single lock on the crown of the head, after the manner of the Japanese. Their language much resembles that of the people called *Tagales* in the Philippine islands. It is agreeable to the ear, with a soft and easy pronunciation. One of its chief graces consists in the facility of transposing words, and even all the syllables of one word; and thus furnishing a variety of double meanings, with which these people are greatly delighted. Though plunged in the deepest ignorance,

Ladron, ignorance, and destitute of every thing valued by the rest of mankind, no nation ever showed more presumption, or a greater conceit of themselves, than these islands, looking on their own nation as the only wise, sensible, and polished one in the world, and beholding every other people with the greatest contempt. Though they are ignorant of the arts and sciences, yet, like every other nation, they have their fables which serve them for history, and some poems which they greatly admire. A poet is with them a character of the first eminence, and greatly respected.

We neither know at what time nor from what place the Ladron islands were first peopled. As Japan lies within six or seven days sail of them, some have been induced to believe, that the first inhabitants of the Ladrones came from Japan. But from their greater resemblance to the inhabitants of the Philippine islands than to the Japanese, it is more probable that they came from the former than the latter. Formerly most of the islands were inhabited; and about 90 years ago, the three principal islands, Guam, Tinian, and Rota, are said to have contained 50,000 people; but since that time, Tinian hath been entirely depopulated, and only 200 or 300 Indians left at Rota to cultivate rice for the island of Guam, which alone is inhabited by Europeans, and where the Spaniards have a governor and a garrison: here also the annual Manilla ship touches for refreshments in her passage from Acapulco to the Philippines. The island of Tinian afforded an asylum to Commodore Anson in 1742; and the masterly manner in which the author of that voyage paints the natural beauties of the country, hath given a degree of estimation not only to this island, but to all the rest, which they had not before. Commodore Byron, in 1765, continued nine weeks at Tinian, and anchored in the very spot where the Centurion lay; but gives a much less favourable account of this climate and country than the former navigator. The water, he says, is brackish, and full of worms; many of his men were seized with fevers, occasioned by the intense heat; the thermometer, which was kept on board the ship, generally stood at 86°, which is but 10 or 11 degrees less than the heat of the blood at the heart; and had the instrument been ashore, he imagines it would have stood much higher than it did. It was with the greatest difficulty that they could penetrate through the woods; and when they had fortunately killed a bull, and with prodigious labour dragged it through the forests to the beach, it stunk, and was full of fly-blows by the time it reached the shore. The poultry was ill-tasted; and within an hour after it was killed, the flesh became as green as grass, and swarmed with maggots. The wild hogs were very fierce; and so large, that a carcase frequently weighed 200 pounds. Cotton and indigo were found on the island. Captain Wallis continued here a month in 1767, but makes no such complaints.

LADY. This title is derived from two Saxon words, which signify *leaf-day*, which words have in time been contracted into the present appellation. It properly belongs only to the daughter of earls, and all of higher rank; but custom has made it a word of complaisance for the wives of knights and of all eminent women.

As to the original application of this expression, it

may be observed, that heretofore it was the fashion for those families, whom God had blessed with affluence, to live constantly at their mansion-houses in the country, and that once a-week, or oftener, the lady of the manor distributed to her poor neighbours, *with her own hands*, a certain quantity of bread; but the practice, which gave rise to this title is now as little known as the meaning of it; however, it may be from that hospitable custom, that to this day the ladies in this kingdom alone serve the meat at their own table.

LADY'S Bedstraw. See GALLIUM.

LADY'S Mantle. See ALCHEMILLA.

LADY'S Smock. See CARDAMINE.

LADY'S Slipper. See CYPRIPEDIUM.

LADY'S Traces. See OPHRYS.

LADY-Day, in law, the 25th of March, being the annunciation of the Holy Virgin. See ANNUNCIATION.

LÆLIUS (Caius), a Roman consul and great orator, surnamed the *Wise*, distinguished himself in Spain in the war against Viriathus the Spanish general. He is highly praised by Cicero, who gives an admirable description of the intimate friendship which subsisted between Lælius and Scipio Africanus the Younger. His eloquence, his modesty, and his abilities, acquired him a great reputation; and he is thought to have assisted Terence in his comedies. He died about 126 B. C.

LÆNA, in antiquity, was a gown worn by the Roman augurs, and peculiar to their office. In this gown they covered their heads when they made their observations on the flight of birds, &c. See AUGUR.

LAER. See BAMBOCCIO.

LÆSTRYGONES, the most ancient inhabitants of Sicily. Some suppose them to be the same as the people of Leontium, and to have been neighbours to the Cyclops. They fed on human flesh; and when Ulysses came on their coasts, they sunk his ships and devoured his companions. They were of a gigantic stature, according to Homer's description. A colony of them, as some suppose, passed over into Italy with Lamus at their head, where they built the town of Formia, whence the epithet of *Læstrygonia* is often used for that of *Formiana*.

LAET (John de), a writer in the 17th century, born at Antwerp, was director of the West India company. He acquired great skill in the languages, in history, and geography; and had the management of Elzevir's edition of *A Description of most Kingdoms in the World*, printed in Latin. He wrote in French, *A Description of the East Indies*, and other works; and died in 1649.

LAETIA, in botany: A genus of the monogynia order, belonging to the polyandria class of plants; and in the natural method ranking with those of which the order is doubtful. The corolla is pentapetalous, or none; the calyx is pentaphyllous; the fruit unilocular and trigonal; the seeds have a pulpy arillus or coat. There are two species, both natives of America. One of them, the apetala, or gum-wood, Dr Wright informs us, is very common in the woodlands and coppes of Jamaica, where it rises to a considerable height and thickness. The trunks are smooth and white; the leaves are three inches long, a little serrated, and somewhat hairy. The stamina are yellow, without petals: the fruit is as large as a plum; and when ripe,

Lady  
||  
Lactia.

opens

Lævinus  
||  
Lagoon.

opens and shows a number of small seeds in a reddish pulp. Pieces of the trunk or branches, suspended in the heat of the sun, discharge a clear turpentine or balsam, which concretes into a white resin, and which seems to be the same as gum sandarach. Pounce is there made of it; and our author is of opinion, that it might be useful in medicine like other gums of the same nature.

LÆVINUS (Torrentinus), commonly called *Vander Bekin*, or *Torrentin*, was a native of Ghent, and bred in the university of Louvain. He afterwards made the tour of Italy, where his virtues obtained him the friendship of the most illustrious personages of his time. On his return to the Low Countries; he was made canon of Leige, and vicar-general to Ernest de Baviere, bishop of that see. At length, having executed a successful embassy to Philip II. of Spain, he was rewarded with the bishopric of Antwerp; from whence he was translated to the metropolitan church of Mechlin, and died there in 1595. He founded a college of Jesuits at Louvain, to which he left his library, medals, and curiosities. He wrote several poems that procured him the character of being, after Horace, the prince of the lyric poets.

LÆVIUS, a Latin poet. It is not well known when he lived, but probably he was more ancient than Cicero. He made a poem intitled *Erotopagnia*, i. e. *love games*. Aulus Gellius quotes two lines of it. Apuleius also quotes six lines from the same poet; but he does not tell from what work he borrowed them. Lævius had also composed a poem intitled *The Centaurs*, which Festus quotes under the title of *Petrarum*.

LAGAN, or LAGON. See FLOTSOM.

LAGEMAN (*lagamannus*), *homo habens legem*, or *homo legalis seu legitimus*; such as we call now "good men of the jury." The word is frequently used in Domeaday, and the laws of Edward the Confessor, cap. 38.

LAGEN (*lagena*), in ancient time, was a measure of wine, containing six sextarii; whence probably is derived our *flagon*. The lieutenant of the tower has the privilege to take *unam lagenam vini ante malum & retro*, of all wine ships that come upon the Thames; and Sir Peter Leiceſter, in his Antiquities of Cheshire, interprets *lagena vini*, "a bottle of wine."

LAGERSTROEMIA, in botany; a genus of the monogynia order, belonging to the polyandria class of plants. The corolla is hexapetalous, and curled; the calyx sixfid, and campanulated; there are many stamina, and of these the six exterior ones thicker than the rest, and longer than the petals.

LAGNY, a town of the isle of France, with a famous benedictine abbey. It is seated on the river Marne, in E. Long. 2. 45. N. Lat. 48. 50.

LAGOECIA, in botany; a genus of the monogynia order, belonging to the pentandria class of plants. The involucreum is universal and partial; the petals bifid; the seeds solitary, inferior.

LAGOON ISLAND, one of the new discovered islands in the South Sea, lying in S. Lat. 18. 47. W. Long. 139. 28. It is of an oval form, with a lake in the middle, which occupies much the greatest part of it. The whole island is covered with trees of different growth. It is inhabited by a race of Indians, tall, of a copper colour, with long black hair. Their wea-

pons are poles or spikes, which are twice as long as themselves. Their habitations were seen under some clumps of palm-trees, which formed very beautiful groves. This island was discovered by Captain Cook in April 1769.

LAGOPUS, in ornithology. See TETRAO.

LAGOS, a sea-port town of Portugal, in the province of Algarva, with a castle near the sea, where there is a good harbour, and where the English fleets bound to the Straits usually take in fresh water. W. Long. 8. 5. N. Lat. 36. 45.

LAGUNA, or *San Christoval de Laguna*, a considerable town in the island of Teneriff, near a lake of the same name, on the declivity of a hill. It has very handsome buildings, and a fine square. W. Long. 16. 24. N. Lat. 28. 30.

LAGUNES OF VENICE, are marshes or lakes in Italy on which Venice is seated. They communicate with the sea, and are the security of the city. There are about 60 islands in these Lagunes, which together make a bishop's see. Eurano is the most considerable, next to those on which Venice stands.

LAGURUS, in botany: A genus of the digynia order, belonging to the triandria class of plants; and in the natural method ranking under the 4th order, *Gramina*. The calyx is bivalved, with a villous awn; the exterior petal of the corolla terminated by two awns, with a third on its back retorted.

LAHOLM, a sea-port town of Sweden, in the province of Gothland, and territory of Holland, seated near the Baltic Sea, with a castle and a harbour, in E. Long. 13. 13. N. Lat. 56. 35.

LAHOR, a large town of Asia, in Indostan, and capital of a province of the same name, and one of the most considerable in the Mogul's dominions. It is of a vast circumference, and contains a great number of mosques, public baths, caravanferas, and pagods. It was the residence of the Great Mogul; but since the removal of the court, the fine palace is going to decay. There is a magnificent walk of shady trees, which runs from this to Agra, that is upwards of 300 miles. Here they have manufactures of cotton cloths and stuffs of all kinds, and they make very curious carpets. E. Long. 75. 55. N. Lat. 31. 40.

LAINÉZ (James), a Spaniard, companion of Ignatius of Loyola, second general of the Jesuits, and a man of a more daring and political character. Having procured from pope Paul IV. the perpetual generalship of the new order of Jesuits, after the death of Ignatius, he got the following privileges ratified by that pontiff, which show that he was in fact the founder of the worst part of their institution: 1. The right of making all sorts of contracts (without the privity of the community) vested in the generals and their delegates. 2. That of giving authenticity to all comments and explanations of their constitutions. 3. The power of making new, and altering the old: this opened the door to their bloody political tenets, not to be attributed to Loyola. 4. That of having prisons independent of the secular authority, in which they put to death refractory brethren. Lainéz died in 1565, aged 53.

LAIRESSE (Gerard), an eminent Flemish painter, born at Leige in 1640. He received the principal part of his instruction from his father Reniére de Laireſſe,

Lagopus  
||  
Laireſſe.

**Lais.** Laïresse, though he is also accounted a disciple of Bar-  
tolet. He first settled at Utrecht, where he lived in  
distressed circumstances; but an accidental recom-  
mendation carrying him to Amsterdam, he soon exchan-  
ged want and obscurity for affluence and reputation.  
He was a perfect master of history; his designs are  
distinguished by the grandeur of the composition; and  
the backgrounds, wherever the subjects required it,  
are rich in architecture, which is an uncommon cir-  
cumstance in that country. He had the unhappiness  
to lose his sight several years before his death, which  
happened in 1711; so that the treatise on design and  
colouring, which passes under his name, was not wrote  
by him, but collected from his observations after he  
was blind, and published after his death. He had  
three sons, two of whom were painters; and also three  
brothers, Ernest, James, and John: Ernest and John  
painted animals, and James was a flower-painter. He  
engraved a good deal in aquafortis: his works consist  
of 256 plates, above half of which were done with his  
own hand. He wrote an excellent book on the art,  
which has been translated into English, and printed at  
London both in 4to and 8vo.

**LAIS**, a celebrated courtesan, daughter of Timan-  
dra the mistress of Alcibiades, born at Hyccara in  
Sicily. She was carried away from her native Greece,  
when Nicias the Athenian general invaded Sicily. She  
first began to sell her favours at Corinth for 10,000  
drams, and the immense number of princes, noble-  
men, philosophers, orators, and plebeians which courted  
her embraces, show how much commendation is owed  
to her personal charms. The expenses which attended  
her pleasures, gave rise to the proverb of *Non cuius  
hamini contingit alere Corinthum*. Even Demosthenes  
himself visited Corinth for the sake of Lais; but when  
he was informed by the courtesan, that admittance to  
her bed was to be bought at the enormous sum of a-  
bout 200l. English money, the orator departed, and  
observed that he would not buy repentance at so dear  
a price. The charms which had attracted Demosthe-  
nes to Corinth, had no influence upon Xenocrates.  
When Lais saw the philosopher unmoved by her beauty,  
she visited his house herself; but there she had no rea-  
son to boast of the licentiousness or easy submission of  
Xenocrates. Diogenes the cynic was one of her  
warmest admirers, and though filthy in his dress and  
manners, yet he gained her heart and enjoyed her most  
unbounded favours. The sculptor Mycon also solicited  
the favours of Lais, but he met with coldness: he,  
however, attributed the cause of his ill reception to the  
whiteness of his hair, and dyed it of a brown colour,  
but to no purpose: "Fool that thou art (said the  
courtesan) to ask what I refused yesterday to thy fa-  
ther." Lais ridiculed the austerity of philosophers,  
and laughed at the weakness of those who pretend to  
have gained a superiority over their passions, by ob-  
serving, that the sages and philosophers of the age were  
not above the rest of mankind, for she found them at  
her door as often as the rest of the Athenians. The suc-  
cess which her debaucheries met at Corinth encoura-  
ged Lais to pass into Thessaly, and more particularly  
to enjoy the company of a favourite youth called Hip-  
pokratrus. She was however disappointed: the women  
of the place, jealous of her charms, and apprehensive  
of her corrupting the fidelity of their husbands, assas-

inated her in the temple of Venus, about 345 years  
before the Christian era. Some suppose that there  
were two persons of this name, a mother and her  
daughter.

Lais,  
Lake.

**LAIETY**, the people as distinguished from the cler-  
gy; (see **CLERGY**). The lay part of his majesty's  
subjects is divided into three distinct states; the civil,  
the military, and the maritime. See **CIVIL**, **MILITARY**, **MARITIME**.

**LAKEL**, a collection of waters contained in some  
cavity in an island place, of a large extent, surroun-  
ded with land, and having no communication with the  
ocean. Lakes may be divided into four kinds. 1. Such  
as neither receive nor send forth rivers. 2. Such as  
emit rivers, without receiving any. 3. Such as receive  
rivers, without emitting any. And, 4. Such as both  
receive and send forth rivers. Of the first kind, some  
are temporary and others perennial. Most of those that  
are temporary owe their origin to the rain, and the  
cavity or depression of the place in which they are  
lodged: thus in India there are several such lakes made  
by the industry of the natives, of which some are a  
mile, and some two, in circuit; these are surrounded  
with a stone-wall, and being filled in the rainy months,  
supply the inhabitants in dry seasons, who live at a  
great distance from springs or rivers. There are also  
several of this kind formed by the inundations of the  
Nile and the Niger; and in Muscovy, Finland, and  
Lapland, there are many lakes formed, partly by the  
rains, and partly by the melting of the ice and snow:  
but most of the perennial lakes, which neither receive  
nor emit rivers, probably owe their rise to springs at  
the bottom, by which they are constantly supplied.  
The second kind of lakes, which emit without recei-  
ving rivers, is very numerous. Many rivers flow from  
these as out of cisterns; where their springs being si-  
tuated low within a hollow place, first fill the cavity  
and make it a lake, which not being capacious enough  
to hold all the water, it overflows and forms a river:  
of this kind is the Wolga, at the head of the river  
Wolga; the lake Odium, at the head of the Tanais;  
the Adac, from whence one branch of the river Ti-  
gris flows; the Ozero, or White lake, in Muscovy, is  
the source of the river Shakma. The great lake  
Chaamay, which emits four very large rivers, which  
water the countries of Siam, Pegu, &c. viz. the  
Menan, the Afa, the Caipoumo, and the Laquia, &c.  
The third species of lakes, which receive rivers but  
emit none, apparently owe their origin to those ri-  
vers which, in their progress from their source, fall-  
ing into some extensive cavity, are collected together,  
and form a lake of such dimensions as may lose as  
much by exhalation as it continually receives from these  
sources: of this kind is that great lake improperly  
called the *Caspian Sea*; the lake Alphaites, also  
called the *Deal Sea*; the lake of Geneva, and several  
others. Of the fourth species, which both receive and  
emit rivers, we reckon three kinds, as the quantity  
they emit is greater, equal or less, than they receive.  
If it be greater, it is plain that they must be supplied  
by springs at the bottom; if less, the surplus of the  
water is probably spent in exhalations; and if it be e-  
qual, their springs just supply what is evaporated by  
the sun.

Lakes are also divided into those of fresh water and  
those

Lake.

those of salt. Dr Halley is of opinion, that all great perennial lakes are saline, either in a greater or less degree; and that this saltiness increases with time: and on this foundation he proposes a method for determining the age of the world.

Large lakes answer the most valuable purposes in the northern regions, the warm vapours that arise from them moderating the pinching cold of those climates; and what is still a greater advantage, when they are placed in warmer climates at a great distance from the sea, the exhalations raised from them by the sun cause the countries that border upon them to be refreshed with frequent showers, and consequently prevent their being barren deserts.

LAKE, or *Laque*, a preparation of different substances into a kind of magistery for the use of painters. One of the finest and first invented of which was that of *gum-lacca* or *lacque*; from which all the rest, as made by the same process, are called by the common name *lacques*. See *LACCA*.

The method of preparing these, in general, may be known by the example of that of the curcuma-root of the shops, called *turmeric root*; the process for the making of which is this: Take a pound of turmeric-root in fine powder, three pints of water, and an ounce of salt of tartar; put all into a glazed earthen vessel, and let them boil together over a clear gentle fire, till the water appears highly impregnated with the root, and will stain a paper to a beautiful yellow. Filtré this liquor, and gradually add to it a strong solution of roch alum in water, till the yellow matter is all curdled together and precipitated; after this pour the whole into a filtre of paper, and the water will run off and leave the yellow matter behind. It is to be washed many times with fresh water, till the water comes off insipid, and then is obtained the beautiful yellow called *lacque of turmeric*, and used in painting.

In this manner may a lake be made of any of the tinging substances that are of a somewhat strong texture, as madder, logwood, &c. but it will not succeed in the more tender species, as the flowers of roses, violets, &c. as it destroys the nice arrangement of parts in those subjects on which the colour depends.

A yellow lake for painting is to be made from broom-flowers in the following manner: Make a ley of pot-ashes and lime reasonably strong; in this boil, at a gentle fire, fresh bloom-flowers till they are white, the ley having extracted all their colour; then take out the flowers, and put the ley to boil in earthen vessels over the fire; add as much alum as the liquor will dissolve; then empty this ley into a vessel of clean water, and it will give a yellow colour at the bottom. Let all settle, and decant off the clear liquor. Wash this powder, which is found at the bottom, with more water, till all the salts of the ley are washed off; then separate the yellow matter, and dry it in the shade. It proves a very valuable yellow.

Lake is at present seldom prepared from any other substance than scarlet rags, cochineal, and Brasil wood. The best of what is commonly sold is made from the colour extracted from scarlet rags, and deposited on the cuttle-bone; and this may be prepared in the following manner: Dissolve a pound of the best pearl-

Lake.

ashes in two quarts of water, and filtre the liquor thro' paper; add to this solution two more quarts of water and a pound of clean scarlet shreds, and boil them in a pewter boiler till the shreds have lost their scarlet colour; take out the shreds and press them, and put the coloured water yielded by them to the other: in the same solution boil another pound of the shreds, proceeding in the same manner; and likewise a third and fourth pound. Whilst this is doing, dissolve a pound and a half of cuttle-fish bone in a pound of strong aquafortis in a glass receiver; adding more of the bone if it appear to produce any ebullition in the aquafortis; and pour this strained solution gradually into the other; but if any ebullition be occasioned, more of the cuttle-fish bone must be dissolved as before, and added till no ebullition appears in the mixture. The crimson sediment deposited by the liquor thus prepared is the lake: pour off the water; and stir the lake in two gallons of hard spring water, and mix the sediment in two gallons of fresh water; let this method be repeated four or five times. If no hard water can be procured, or the lake appears too purple, half an ounce of alum should be added to each quantity of water before it be used. Having thus sufficiently freed the lake from the salts, drain off the water through a filtre, covered with a worn linen cloth. When it has been drained to a proper dryness, let it be dropped through a proper funnel on clean boards, and the drops will become small cones or pyramids, in which form the lake must be suffered to dry, and the preparation is completed.

Lake may be prepared from cochineal, by gently boiling two ounces of cochineal in a quart of water; filtering the solution through paper, and adding two ounces of pearl-ashes dissolved in half a pint of warm water and filtered through paper. Make a solution of cuttle-bone as in the former process; and to a pint of it add two ounces of alum dissolved in half a pint of water. Put this mixture gradually to that of the cochineal and pearl-ashes, as long as any ebullition appears to arise, and proceed as above.—A beautiful lake may be prepared from Brasil wood, by boiling three pounds of it for an hour in a solution of three pounds of common salt in three gallons of water, and filtering the hot fluid through paper; add to this a solution of five pounds of alum in three gallons of water. Dissolve three pounds of the best pearl-ashes in a gallon and a half of water, and purify it by filtering; put this gradually to the other, till the whole of the colour appear to be precipitated, and the fluid be left clear and colourless. But if any appearance of purple be seen, add a fresh quantity of the solution of alum by degrees, till a scarlet hue be produced. Then pursue the directions given in the first process with regard to the sediment. If half a pound of seed lac be added to the solution of pearl-ashes, and dissolved in it before its purification by the filtre, and two pounds of the wood, and a proportional quantity of the common salt and water be used in the coloured solution, a lake will be produced that will stand well in oil or water, but is not so transparent in oil as without the seed-lac. The lake with Brasil wood may be also made by adding half an ounce of anotto to each pound of the wood; but the anotto must be dissolved in the solution of pearl-

pearl-ashes. There is a kind of beautiful lake brought from China; but as it does not mix well with either water or oil, though it dissolves entirely in spirit of wine, it is not of any use in our kinds of painting. This has been erroneously called *sufflower*.

*Orange LAKE*, is the tinging part of anotto precipitated together with the earth of alum. This pigment, which is of a bright orange colour and fit for varnish painting, where there is no fear of flying, and also for putting under crystal to imitate the vinegar garnet, may be prepared by boiling four ounces of the best anotto and one pound of pearl ashes half an hour in a gallon of water; and straining the solution through paper. Mix gradually with this a solution of a pound and a half of alum in another gallon of water; desisting when no ebullition attends the commixture. Treat the sediment in the manner already directed for other kinds of lake, and dry it in square bits or round lozenges.

LAMA, a synonyme of the *camelus pacos*. See CAMELUS.

LAMA, the sovereign pontiff, or rather god, of the Asiatic Tartars, inhabiting the country of Barantola. The lama is not only adored by the inhabitants of the country, but also by the kings of Tattary, who send him rich presents, and go in pilgrimage to pay him adoration, calling him *lama congju*, i. e. "god, the everlasting father of heaven." He is never to be seen but in a secret place of his palace, amidst a great number of lamps, sitting cross-legged upon a cushion, and adorned all over with gold and precious stones; where at a distance they prostrate themselves before him, it not being lawful for any to kiss even his feet. He is called the *great lama*, or *lama of lamas*; that is, "priest of priests." The orthodox opinion is, that when the grand lama seems to die either of old age or infirmity, his soul in fact only quits a crazy habitation to look for another younger or better; and it is discovered again in the body of some child, by certain tokens known only to the lamas or priests, in which order he always appears.

The following account of the ceremonies attending the inauguration of the infant lama in Thibet is extracted from the first volume of the *Asiatic Researches*.

The emperor of China appears on this occasion to have assumed a very conspicuous part in giving testimony of his respect and zeal for the great religious father of his faith. Early in the year 1784, he dismissed ambassadors from the court of Pekin to Teeshoo Loomboo, to represent their sovereign in supporting the dignity of the high priest, and do honour to the occasion of the assumption of his office. Dalia Lama and the viceroy of Lassa, accompanied by all the court, one of the Chinese generals stationed at Lassa with a part of the troops under his command, two of the four magistrates of the city, the heads of every monastery throughout Thibet, and the emperor's ambassadors, appeared at Teeshoo Loomboo, to celebrate this epocha in their theological institutions. The 28th day of the seventh moon, corresponding nearly, as their year commences with the vernal equinox, to the middle of October 1784, was chosen as the most auspicious for the ceremony of inauguration: a few days previous to which the lama was conducted from Terpaling the monastery in which he had passed his infancy, with every

mark of pomp and homage that could be paid by an enthusiastic people. So great a concourse as assembled either from curiosity or devotion was never seen before, for not a person of any condition in Thibet was absent who could join the suite. The procession was hence necessarily constrained to move so slow, that though Terpaling is situated at the distance of 20 miles only from Teeshoo Loomboo, three days expired in the performance of this short march. The first halt was made at Tiondue; the second at Summaar, about six miles off, whence the most splendid parade was reserved for the lama's entry on the third day, the account of which is given by a person who was present in the procession. The road, he says, was previously prepared by being whitened with a wash, and having piles of stones heaped up with small intervals between on either side. The retinue passed between a double row of priests who formed a street extending all the way from Summaar to the gates of the palace. Some of the priests held lighted rods of a perfumed composition that burn like decayed wood, and emit an aromatic smoke; the rest were furnished with the different musical instruments they use at their devotions, such as the gong, the cymbal, hautboy, trumpets, drums, and sea-shells, which were all sounded in union with the hymn they chanted. The crowd of spectators were kept without the street, and none admitted on the high road but such as properly belonged to or had a prescribed place in the procession, which was arranged in the following order.

The van was led by three military commandants or governors of districts at the head of 6000 or 7000 horsemen armed with quivers, bows, and matchlocks. In their rear followed the ambassador with his suite, carrying his diploma as is the custom of China, made up in the form of a large tube, and fastened on his back. Next the Chinese general advanced with the troops under his command, mounted and accoutered after their way with fire-arms and sabres; then came a very numerous group bearing the various standards and insignia of state; next to them moved a full band of wind and other sonorous instruments; after which were led two horses richly caparisoned, each carrying two large circular stoves disposed like panniers across the horse's back and filled with burning aromatic woods. These were followed by a senior priest, called a *lama*, who bore a box containing books of their form of prayer and some favourite idols. Next nine sumptuary horses were led loaded with the lama's apparel; after which came the priests immediately attached to the lama's person for the performance of daily offices in the temple, amounting to about 700; following them were two men each carrying on his shoulder a large cylindrical gold insignium embossed with emblematical figures (a gift from the emperor of China). The Dahunners and Soopoons, who were employed in communicating addresses and distributing alms, immediately preceded the lama's bier, which was covered with a gaudy canopy, and borne by eight of the 16 Chinese appointed for this service. On one side of the bier attended the regent, on the other the lama's father. It was followed by the heads of the different monasteries, and as the procession advanced, the priests who formed the street fell in the rear and brought up the suit, which moved at an extremely slow pace, and about

Lama,  
Lamb.

noon was received with in the confines of the monastery, amidst an amazing display of colours, the acclamations of the crowd, solemn music, and the chanting of their priests.

The lama being safely lodged in the palace, the regent and Soopon Choomboo went out, as is a customary compliment paid to visitors of high rank on their near approach, to meet and conduct Dalai Lama and the viceroy of Lassa who were on the way to Teeshoo Loomboo. Their retinues encountered the following morning at the foot of Painom castle, and the next day together entered the monastery of Teeshoo Loomboo, in which both Dalai Lama and the viceroy were accommodated during their stay.

The following morning, which was the third after Teeshoo Lama's arrival, he was carried to the great temple, and about noon seated upon the throne of his progenitors; at which time the emperor's ambassador delivered his diploma, and placed the presents with which he had been charged at the lama's feet.

The three next ensuing days, Dalai Lama met Teeshoo Lama in the temple, where they were assisted by all the priests in the invocation and public worship of their gods. The rites then performed, completed, as we understand, the business of inauguration. During this interval all who were at the capital were entertained at the public expence, and alms were distributed without reserve. In conformity likewise to previous notice circulated every where for the same space of time, universal rejoicings prevailed throughout Thibet. Banners were unfurled on all their fortresses, the peasantry filled up the day with music and festivity, and the night was celebrated by general illuminations. A long period was afterwards employed in making presents and public entertainments to the newly inducted lama, who, at the time of his accession to the Musnud, or if we may use the term, pontificate of Teeshoo Loomboo, was not three years of age. The ceremony was begun by Dalai Lama, whose offerings are said to have amounted to a greater value, and his public entertainments to have been more splendid than the rest. The second day was dedicated to the viceroy of Lassa. The third to the Chinese general. Then followed the *cul-tung* or magistrates of Lassa, and the rest of the principal persons who had accompanied Dalai Lama. After which the regent of Teeshoo Loomboo, and all that were dependent on that government, were severally admitted, according to pre-eminence of rank, to pay their tributes of obedience and respect. As soon as the acknowledgements of all those were received who were admissible to the privilege, Teeshoo Lama made in the same order suitable returns to each, and the consummation lasted 40 days.

Many importunities were used with Dalai Lama to prolong his stay at Teeshoo Loomboo; but he excused himself from encumbering the capital any longer with so numerous a concourse of people as attended on his movements, and deeming it expedient to make his absence as short as possible from the seat of his authority, at the expiration of 40 days he withdrew with all his suite to Lassa, and the emperor's ambassador received his dismissal to return to China, and thus terminated this famous festival.

LAMB, in zoology, the young of the sheep kind. See Ovis.

A male lamb of the first year is called a *wedder-hog*, and the female a *ewe-hog*; the second year it is called a *wedder*, and the female a *sheave*. If a lamb be sick, mare's milk with water may be given it; and by blowing into the mouth, many have been recovered, after appearing dead. The best season for weaning them is when they are 16 or 18 weeks old; and about Michaelmas the males should be separated from the females, and such males as are not designed for rams, gelded. "Lamb (says Dr Cullen) appears a more-fibrous kind of meat, and upon that account is less easily soluble than veal. In Scotland, house-lamb is never reared to advantage."

*Scythian LAMB*, a kind of moss, which grows about the roots of fern in some of the northern parts of Europe and Asia, and sometimes assumes the form of a quadruped; so called from a supposed resemblance in shape to that animal. It has something like four feet, and its body is covered with a kind of down. Travellers report that it will suffer no vegetable to grow within a certain distance of its seat. Sir Hans Sloan read a memoir upon this plant before the Society; for which those who think it worth while may consult their Transactions, N<sup>o</sup> 245, p. 461. Mr Bell, in his "Account of a Journey from St Petersburg to Ispahan," informs us that he searched in vain for this plant in the neighbourhood of Altrachan, when at the same time the more sensible and experienced amongst the Tartars treated the whole history as fabulous. See Plate CCLIX.

LAMBECIUS (Peter), born at Hamburg in 1628, was one of the most learned men of his time. He went very young to study in foreign countries, at the expence of his uncle the learned Holstenius. He was chosen professor of history at Hamburg in 1652, and rector of the college of that city in 1660. He had taken his degree of doctor of law in France before. He suffered a thousand vexations in his own country; because his enemies vexed him with atheism, and censured his writings bitterly. He married a rich lady, but who was so very covetous, that he left her in disgust within a fortnight. He went to Vienna, and from thence to Rome, where he publicly professed the Catholic religion. He returned to Vienna in 1662, where he was kindly received by the emperor, who appointed him his sublibrary-keeper, and afterwards his principal librarian, with the title of *counsellor and historiographer*; in which employment he continued till his death, and gained a great reputation by the works he published, viz. 1. *An Essay on Aulus Gellius*. 2. *The Antiquities of Hamburg*. 3. *Remarks on Codinus's Antiquities of Constantinople*, &c.

LAMBERT of Aschaffenburg, a Benedictine monk, in the 11th century, wrote several works; among which is a history of Germany, from the year 1050 to 1077, which is esteemed.

LAMBERT (John), general of the parliament's forces in the civil wars of the last century, was of a good family, and for some time studied the law in one of the ins of court; but upon the breaking out of the rebellion, went into the parliament-army, where he soon rose to the rank of colonel, and by his conduct and valour performed many eminent services. But when Cromwell seemed inclined to assume the title of king, Lambert opposed it with great vigour, and even refused to take the oath required by the assembly and council.

Lamb  
Lamb

council to be faithful to the government; on which Cromwell deprived him of his commission, but granted him a pension of 2000 l. a-year. This was an act of prudence rather than of generosity; as he well knew, that such genius as Lambert's, rendered desperate by poverty, was capable of attempting any thing.

Lambert being now divested of all employment, retired to Wimbledon-house; where turning florist, he had the finest tulips and gilliflowers that could be got for love or money. Yet amidst these amusements he still nourished his ambition: for when Richard Cromwell succeeded his father, he acted so effectually with Fleetwood, Desborough, Vane, Berry, and others, that the new protector was obliged to surrender his authority; and the members of the long-parliament, who had continued sitting till the 20th of April 1653, when Oliver dismissed them, were restored to their seats, and Lambert was immediately appointed one of the council of state, and colonel of a regiment of horse and another of foot. For this service the parliament presented him 1000 l. to buy a jewel; but he distributed it among his officers. This being soon known to the parliament, they concluded that he intended to secure a party in the army. They therefore courteously invited him to come to London; but resolved, as soon as he should arrive, to secure him from doing any further harm. Lambert, apprehensive of this, delayed his return, and even refused to resign his commission when it was demanded of him and of eight of the other leading officers; and, marching up to London with his army, dislodged the parliament by force in October 1659. He was then appointed, by a council of the officers, major-general of the army, and one of the new council for the management of public affairs, and sent to command the forces in the north. But general Monk marching from Scotland into England to support the parliament, against which Lambert had acted with such violence, the latter, being deserted by his army, was obliged to submit to the parliament, and by their order was committed prisoner to the tower; whence escaping he soon appeared in arms with four troops under his command, but was defeated and taken prisoner by colonel Ingoldsbj.

At the Restoration he was particularly excepted out of the act of indemnity. Being brought to his trial on the 4th of June 1662, for levying war against the king, this daring general behaved with more submission than the meanest of his fellow-prisoners, and was by his majesty's favour reprived at the bar, and confined during his life in the island of Guernsey.

LAMBERT (Anna Theresa de Marguenat de Courcelles, marchioness of), an elegant moral writer, was the only daughter of Stephen Marguenat lord of Courcelles. In 1666 she married Henry de Lambert, who at his death was lieutenant-general of the army; and she afterwards remained a widow with a son and a daughter, whom she educated with great care. Her house was a kind of academy, to which persons of distinguished abilities regularly resorted. She died at Paris in 1733, aged 86. Her works, which are written with much taste, judgment, and delicacy, are printed in two volumes. The advice of a mother to her son and daughter are particularly esteemed.

LAMBIN (Dennis), an eminent classical commentator, was born at Montreuil-sur-Mer, in Picardy,

and acquired great skill in polite literature. He lived for a long time at Rome; and at his return to Paris was made royal professor of the Greek language. He died in 1572, aged 56, of pure grief at the death of his friend Ramus, who was murdered at the massacre on St Bartholomew's day. He wrote commentaries on Plautus, Lucietius, Cicero, and Horace, and other works. His commentary on Horace is more particularly esteemed.

LAMECH, of the race of Cain, was the son of Methusael, and father of Jabal, Jubal, Tubal-cain, and Naamah. Gen. iv. 18, 19, 20, &c. Lamech is celebrated in scripture for his polygamy, whereof he is thought to be the first author in the world. He married Adah and Zillah. Adah was the mother of Jabal and Jubal; and Zillah of Tubal-cain, and Naamah his sister. One day Lamech said to his wives, "Hear me, ye wives of Lamech; I have slain a man to my wounding, and a young man to my hurt. If Cain shall be avenged seven fold, truly Lamech seventy and seven fold." These words are an unintelligible riddle. The reader may consult the commentators. There is a tradition among the Hebrews, that Lamech growing blind, ignorantly killed Cain, believing him to be some wild beast; and that afterwards he slew his own son Tubal-cain, who had been the cause of this murder, because he had directed him to shoot at a certain place in the thickets where he had seen something stir. See CAIN.

Several other suppositions are produced in order to explain this passage concerning Lamech, and all almost equally uncertain and absurd.

LAMECH, the son of Methuselah, and father of Noah. He lived a hundred fourscore and two years before the birth of Noah, (Gen. v. 25, 31.); and after that, he lived five hundred and ninety-five years longer: thus the whole time of his life was seven hundred seventy-seven years, being born in the year of the world 874, and dying in the year of the world 1651.

LAMELLÆ, in natural history, denotes very thin plates, such as the scales of fishes are composed of.

LAMENTATIONS, a canonical book of the Old Testament, written by the prophet Jeremiah, according to archbishop Usher and some other learned men, who follow the opinion of Josephus and St Jerom, on occasion of Josiah's death. But this opinion does not seem to agree with the subject of the book, the lamentation composed by Jeremiah on that occasion being probably lost. The fifty-second chapter of the book of Jeremiah was probably added by Ezra, as a preface or introduction to the Lamentations: the two first chapters are employed in describing the calamities of the siege of Jerusalem: in the third the author deplores the persecutions he himself had suffered: the fourth treats of the desolation of the city and temple, and the misfortune of Zedekiah: the fifth chapter is a prayer for the Jews in their dispersion and captivity: and at the close of all he speaks of the cruelty of the Edomites, who had insulted Jerusalem in her misery. All the chapters of this book, except the last, are in metre, and digested in the order of the alphabet; with this difference, that in the first, second, and fourth chapters, the first letter of every verse follows the order of the alphabet; but in the third the same initial letter is continued for three verses together,

Lamech  
Laurentius  
Lans.

Lamia  
||  
Lamium.

ther. This order was probably adopted, that the book might be more easily learnt and retained. The subject of this book is of the most moving kind; and the style throughout lively, pathetic, and affecting. In this kind of writing the prophet Jeremiah was a great master, according to the character which Grotius gives of him, *Mirus in affectibus concitantis*.

LAMIA (anc. geog.) a town of the Phthiotis, a district of Thessaly. Famous for giving name to the *Bellum Lamiacum*, waged by the Greeks on the Macedonians after Alexander's death.

LAMIACUM BELLUM happened after the death of Alexander, when the Greeks, and particularly the Athenians, incited by their orators, resolved to free Greece from the garrisons of the Macedonians. Leosthenes was appointed commander of a numerous force, and marched against Antipater, who then presided over Macedonia. Antipater entered Thessaly at the head of 13,000 foot and 600 horse, and was beaten by the superior force of the Athenians and of their Greek confederates. Antipater after this blow fled to Lamia, where he resolved, with all the courage and sagacity of a careful general, to maintain a siege with about 8000 or 9000 men that had escaped from the field of battle. Leosthenes, unable to take the city by storm, began to make a regular siege. His operations were delayed by the frequent sallies of Antipater; and Leosthenes being killed by the blow of a stone which he received, Antipater made his escape out of Lamia, and soon after, with the assistance of the army of Craterus brought from Asia, he gave the Athenians battle near Cranon; and though only 500 of their men were slain, yet they became so dispirited, that they sued for peace from the conqueror. Antipater at last with difficulty consented, provided they raised taxes in the usual manner, received a Macedonian garrison, defrayed the expenses of the war, and, lastly, delivered into his hands Demosthenes and Hyperides, the two orators whose prevailing eloquence had excited their countrymen against him. These disadvantageous terms were accepted by the Athenians, yet Demosthenes had time to escape and poison himself. Hyperides was carried before Antipater, who ordered his tongue to be cut off, and afterwards to be put to death.

LAMIÆ, a sort of demons who had their existence in the imaginations of the heathens, and were supposed to devour children. Their form was human, resembling beautiful women. Horace makes mention of them in his Art of Poetry. The name, according to some, is derived from *lamo* "to tear;" or according to others, is a corruption of a Hebrew word signifying to devour. They are also called *Larvæ* or *Lemures*.

LAMINÆ, in physiology, thin plates, or tables, whereof any thing consists; particularly the human skull, which are two, the one laid over the other.

LAMINIUM, (anc. geog.), a town of the Carpetani in the Hither Spain; at the distance of seven miles from the head of the Anas or Guadiana: Now *Montiel*, a citadel of New Castile; and the territory called *Ager Laminitanus*, is now *el Campo de Montiel*, (Clusius)

LAMIUM, *DEAD-Nettle*, in botany: A genus of the gymnospermia order, belonging to the didynamia class of plants; and in the natural method ranking

under the 42d order, *Verticillatæ*. The upper lip of the corolla is entire, arched, the under lip bilobous; the throat with a dent or tooth on each side the margin. There are eight species; of which only two, viz. the album, white archangel or dead-nettle, and the purpureum or red archangel, deserve notice. The first grows frequently under hedges and in waste places; the second is very common in gardens and corn-fields. The flowers of the first, which appear in April and May, have been particularly celebrated in uterine fluxes and other female weaknesses, and also in disorders of the lungs; but they appear to be of very weak virtue; and they are at present so little used in Britain as to have now no place in our pharmacopœias. The young leaves of both species are boiled and eaten in some places like greens.

LAMMAS-DAY, the first of August; so called, as some will have it, because lambs then grow out of season, as being too big. Others derive it from a Saxon word, signifying "loaf-mass," because on that day our forefathers made an offering of bread made with new wheat.

On this day the tenants who formerly held lands of the cathedral church in York, were bound by their tenure to bring a lamb alive into the church at high-mass.

LAMOIGNON (Chretien Francis de) marquis of Baille, and president of the parliament of Paris, was born in 1644. His father would not trust the education of his son to another, but took it upon himself, and entered into the minutest particulars of his first studies: the love of letters and a solid taste were the fruits the scholar reaped from this valuable education. He learned rhetoric in the Jesuit's college, made the tour of England and Holland, and returned home the admiration of those meetings regularly held by persons of the first merit at his father's house. The several branches of literature were however only his amusement: the law was his real employ; and the eloquence of the bar at Paris owes its reformation from bombast and affected erudition to the plain and noble pleadings of M. Lamoignon. He was appointed the king's advocate general in 1673; which he discharged until 1698, when the presidentship of the parliament was conferred on him. This post he held nine years, when he was allowed to resign in favour of his eldest son: he was chosen president of the royal academy of inscriptions in 1705. The only work he suffered to see the light was his *Pleader*, which is a monument of his eloquence and inclination to polite letters. He died in 1709.

LAMP, a vessel containing oil, with a lighted wick.

Lamps were in general use amongst the Jews, Greeks, and Romans. The candlestick with seven branches, placed in the sanctuary by Moses, and those which Solomon afterwards prepared for the temple, were crystal lamps filled with oil, and fixed upon the branches. The lamps or candlesticks made use of by the Jews in their own houses were generally put into a very high stand on the ground. The lamps supposed to be used by the foolish virgins, &c. in the gospel, were of a different kind — According to critics and antiquaries, they were a sort of torches, made of iron or potter's earth, wrapped about with old linen, and moistened from time to time with oil. Matth. xxv.

**Lamp.** 1, 2. The lamps of Gideon's foldiers were of the fame kind. The use of wax was not unknown to the Romans, but they generally burnt lamps; hence the proverb *Tempus et oleum perdidit*, "I have lost my labour." Lamps were sometimes burnt in honour of the dead, both by Greeks and Romans.

long the ground, or moved in any manner, the flame will always be uppermost, and the oil cannot spill.

It is in this manner they hang the compass at sea; and thus should all the moon-lanterns be made, that are carried before coaches, chaifes, and the like.

*Argand's LAMP.* This is a very ingenious contrivance, and the greatest improvement in lamps that has yet been made. It is the invention of a citizen of Geneva; and the principle on which the superiority of the lamp depends, is the admission of a larger quantity of air to the flame than can be done in the common way. This is accomplished by making the wick of a circular form; by which means a current of air rushes through the cylinder on which it is placed with great force; and, along with that which has access to the outside, excites the flame to such a degree that the smoke is entirely consumed. Thus both the light and heat are prodigiously increased, at the same time that there is a very considerable saving in the expence of oil, the consumption of the phlogiston being exceedingly augmented by the quantity of air admitted to the flame; so that what in common lamps is dissipated in smoke is here converted into a brilliant flame.

This lamp is now very much in use; and is applied not only to the ordinary purposes of illumination, but also to that of a lamp furnace for chemical operations, in which it is found to exceed every other contrivance yet invented. It consists of two parts, *viz.* a reservoir for the oil, and the lamp itself. The reservoir is usually in the form of a vase, and has the lamp proceeding from its side. The latter consists of an upright metallic tube about one inch and six-tenths in diameter, three inches in length, and open at both ends. Within this is another tube about an inch in diameter, and nearly of an equal length; the space betwixt the two being left clear for the passage of the air. The internal tube is closed at the bottom, and contains another similar tube about half an inch in diameter, which is folded to the bottom of the second. It is perforated throughout, so as to admit a current of air to pass through it; and the oil is contained in the space betwixt the tube and that which surrounds it. A particular kind of cotton cloth is used for the wick, the longitudinal threads of which are much thicker than the others, and which nearly fills the space into which the oil flows; and the mechanism of the lamp is such, that the wick may be raised or depressed at pleasure. When the lamp is lighted, the flame is in the form of a hollow cylinder; and, by reason of the strong influx of air through the heated metallic tube, becomes extremely bright, the smoke being entirely consumed for the reasons already mentioned. The heat and light are still farther increased, by putting over the whole a glass cylinder nearly of the size of the exterior tube. By diminishing the central aperture, the heat and light are proportionably diminished, and the lamp begins to smoke. The access of air both to the external and internal surfaces of the flame is indeed so very necessary, that a sensible difference is perceived when the hand is held even at the distance of an inch below the lower aperture of the cylinder; and there is also a certain length of wick at which the effect of the lamp is strongest. If the wick be very short, the flame, tho' white and brilliant, emits a disagreeable and pale kind

Dr St Clair, in the *Philos. Transf.* n<sup>o</sup> 245, gives the description of an improvement on the common lamp. He proposes that it should be made two or three inches deep, with a pipe coming from the bottom almost as high as the top of the vessel. Let it be filled so high with water that it may cover the hole of the pipe at the bottom, that the oil may not get in at the pipe and so be lost. Then let the oil be poured in so as to fill the vessel almost brim full; and to the vessel must be adapted a cover having as many holes as there are to be wicks. When the vessel is filled and the wicks lighted, if water falls in by drops at the pipe, it will always keep the oil at the same height or very near it; the weight of the water being to that of the oil as 20<sup>7</sup>/<sub>8</sub> to 19, which in two or three inches makes no great difference. If the water runs faster than the oil wastes, it will only run over at the top of the pipe, and what does not run over will come under the oil, and keep it at the same height.

From experiments made in order to ascertain the expence of burning chamber oil in lamps, it appears, that a taper lamp, with eight threads of cotton in the wick, consumes in one hour  $\frac{1}{3}$  oz. of spermaceti oil, at 2s. 6d. per gallon; so that the expence of burning 12 hours is 4.57 farthings. This lamp gives as good a light as the candles of eight and ten in the pound; it seldom wants snuffing, and casts a strong and steady light. A taper, chamber, or watch lamp, with four ordinary threads of cotton in the wick, consumes 0.1664 oz. of spermaceti oil in one hour; the oil at 2s. 6d. per gallon, makes the expence of burning 12 hours only 2.34 farthings.

*Perpetual LAMPS.* The testimonies of Pliny, St Austin, and others, have led many to believe that the ancients had the invention of perpetual lamps; and some moderns have attempted to find out the secret, but hitherto in vain. Indeed it seems no easy matter to find out either a perpetual wick or a perpetual oil. The curious may read Dr Plot's conjectures on the subject in the *Philos. Transf.* n<sup>o</sup> 166; or in Lowthorp's abridgment, vol. iii. p. 636. But few, we believe, will give themselves the trouble of searching for the secret, when they consider that the credulity of Pliny and of St Austin was such, that their testimony does not seem a sufficient inducement to us to believe that a lamp was ever formed to burn 1500 or 1000 years: much less is it credible that the ancients had the secret of making one burn for ever.

*Rolling LAMP:* A machine A B, with two moveable circles D E, F G, within it; whose common centre of motion and gravity is at K, where their axes of motion cross one another. If the lamp K C, made pretty heavy and moveable about its axis H I, and whose centre of gravity is at C, be fitted within the inner circle, the common centre of gravity of the whole machine will fall between K and C; and by reason of the pivots A, B, D, E, H, I, will be always at liberty to descend; hence, though the whole machine be rolled a-

*Lamp.* of light; and if very long, the upper part becomes brown, and smoke is emitted.

The saving of expence in the use of this instrument for common purposes is very considerable. By some experiments it appears that the lamp will continue to burn three hours for the value of one penny; and the following was the result of the comparison between the light emitted by it and that of a candle. The latter having been suffered to burn so long without snuffing, that large lumps of coally matter were formed upon the wick, gave a light at 24 inches distance equal to the lamp at 129 inches; whence it appeared that the light of the lamp was equal to 28 candles in this state. On snuffing the candle, however, its light was so much augmented, that it became necessary to remove it to the distance of 67 inches before its light became equal to that of the lamp at 129 inches; whence it was concluded that the light of the lamp was somewhat less than that of four candles fresh snuffed. At another trial, in which the lamp was placed at the distance of 131½ inches, and a candle at the distance of 55 inches, the lights were equal. In these experiments the candles made use of were 10½ inches long, and 2¼ inches in diameter. When the candle was newly snuffed, it appeared to have the advantage; but the lamp soon got the superiority; and on the whole it was concluded, that the lamp is at least equivalent to half a dozen of tallow candles of six in the pound; the expence of the one being only two pence halfpenny, and the other eight pence in seven hours.

The best method of comparing the two lights together seems to be the following. Place the greater light at a considerable distance from a white paper, the smaller one being brought nearer or removed farther off as occasion requires. If an angular body be held before the paper, it will project two shadows: these two shadows can coincide only in part; and their angular extremities will, in all positions but one, be at some distance from each other; and being made to coincide in a certain part of their bulk, they will be bordered by a lighter shadow, occasioned by the exclusion of the light from each of the two luminous bodies respectively. These lighter shadows, in fact, are spaces of the white paper illuminated by the different luminous bodies, and may easily be compared together, because at a certain point they actually touch one another. If the space illuminated by the smaller light appear brightest, the light must be removed farther off, but the contrary if it appear more obscure.

On cutting open one of Argand's wicks longitudinally, and thus reducing the circular flame to a straight lined one, the lights appeared quite equal in power; but the circular one had by far the greatest effect in dazzling the eyes; though when the long flame was made to shine on the paper, not by the broadside, but in the direction of its length, it appeared more dazzling than the other. On placing this long flame at right angles to the ray of Argand's lamp, it projected no shadow; but when its length was placed in the direction of the ray, it gave a shadow bordered with two broad, well defined, and bright lines.

The broad wicked lamp seems to have the advantage of the other, as requiring less apparatus; and indeed by this contrivance we may, at the most trifling expence have a lamp capable of giving any degree of light we

please. The only disadvantage attending either the one or the other is, that they cannot easily be carried from one place to another; and in this respect it does not seem possible by any means to bring lamps to an equality with candles.

*LAMP-Black*, among colourmen. See *COLOUR-Making*, n<sup>o</sup> 18, 19.—Substances painted with lamp-black and oil, are found to resist the effects of electricity to a surprising degree; so that in many cases even lightning itself seems to have been repelled by them. See *LIGHTNING; THUNDER; CHEMISTRY*, n<sup>o</sup> 700. and *ELECTRICITY*, p. 478. col. 1.

*LAMPADARY*, an officer in the ancient church of Constantinople, so called from his employment, which was to take care of the lamps, and to carry a taper before the emperor or patriarch when they went to church or in procession.

*LAMPAS*, in friariery. See there, § xxxv.

*LAMPREY*. See *PETROMYZON*.

*LAMPRIIDIUS* (*Ælius*), a Latin historian, who lived under the emperors Dioclesian and Constantine the Great. We have, of his writing, the lives of four emperors, Antoninus, Commodus, Diadumenus, and Heliogabalus. Some attribute the life of Alexander Severus to him; but the MS. in the palatine library ascribes it to Spartian.

*LAMPRIDIUS* (*Benedict*), of Cremona, a celebrated Latin poet of the 16th century. He taught Greek and Latin at Rome and at Padua, until he was invited to Mantua by Frederic Gonzaga to undertake the tuition of his son. We have epigrams and lyric verses of this writer, both in Greek and Latin, which were printed separately, as well as among the *Deliciae* of the Italian poets.

*LAMPUSACUS*, or *LAMPUSACUM*, (anc. geog.), a considerable city of Mysia; more anciently called *Pilyea*, (*Hom.*), because abounding in pine trees, a circumstance confirmed by Pliny; situated at the north end or entrance of the Hellespont into the Propontis, with a commodious harbour, opposite to Callipolis in the Thracian Chersonesus. It was assigned by Artaxerxes to Themistocles, for furnishing his table with wine, in which the country abounded. It was saved from the ruin threatened by Alexander because in the interest of Persia, by the address of Anaximenes the historian, sent by his fellow-citizens to avert the king's displeasure; who hearing of it, solemnly declared he would do the very reverse of Anaximenes's request, who therefore begged the king utterly to destroy it, which he could not do because of his oath. *Lampusacus* the epithet, denoting *lasicus*, the character of the people: still called *Lampusacus*. E. Long. 28°. N. Lat. 40. 12.

*LAMPYRIS*, the *FIRE-FLY*, a genus of insects belonging to the coleoptera order; the characters of which are: The antennae filiform; the elytra flexible; the thorax is flat, of a semiorbicular form, surrounding and concealing the head. The segments of the abdomen terminate in papillae, which are turned up towards the elytra, and partly fold one over the other. The females in general are apterous.

There are 18 species: of which the most remarkable is the noctiluca. The male of this insect is less than the female: its head is shaped exactly in the same manner, and covered likewise by the plate of the thorax, only it appears rather longer than that of the female.

male. Both the head and antennæ are black. The thorax of the male, which is smaller and shorter than that of the female, has the folds and papilla on its sides much less remarkable: but the greatest difference that is found between the two sexes is, that the male is covered with brown elytra, flagellated and marked with two lines longitudinally. The elytra are longer than the abdomen, and under them lie the wings. The two last rings of the abdomen are not so bright as those of the female, only there appear four luminous points, two upon each of the two last rings.

The insect called *glow worm*, and which is frequently met with towards evening, in the month of June, in woods and meadows, is the female belonging to this species. By the shining light which it emits, it attracts the male; a wonderful instance of the divine providence. It is apparent that their shining light depends on a liquor placed at the lower extremity of the insect, which when in motion, the light is more lively and shining, and of a finer green. This light the insect withdraws at pleasure, either by unfolding or contracting itself. As a proof that the light depends on a phosphorus matter, you may crush the animal, which, though dead and bruised, leaves a luminous substance on the hand, that only loses its lustre when dried.

The perfect insect flies about during the evening in autumn, and frequents the grassy plantations of juniper trees.

LAMY, or LAMI, (Bernard), was born at Mons in 1640, and studied there under the fathers of the oratory; with whose way of life he was so pleased, that he went to Paris in 1658, and entered into the institution. He had a great taste for the sciences, and studied them all; he entered into the priesthood in 1667, and taught philosophy at Saumur and Angiers; which latter place he was obliged to quit by an order procured from court for adopting the new philosophy instead of that of Aristotle. In 1676 he went to Grenoble, where cardinal Camus was then bishop; who conceived such an esteem for him, that he retained him near his person, and derived considerable services from him in the government of his diocese. After continuing many years there, he went to reside at Rouen, where he died in 1715. He wrote several scientific works, besides others in divinity.

LANCARIM SPRING, the name of a medicated water of Glamorganshire. It has its name from a town near which it rises; and has been very long famous in the place for the cure of the king's evil. The body of water is about an ell broad, and runs between two hills covered with wood. About 12 yards from this spring the rill falls from a rock of about eight or nine feet high, with a considerable noise. The spring is very clear, and rises out of a pure white marble. The cures that have been performed there, are proofs of a real power in the water; but there is some question whether the water, or its motion and coldness, does the good; for the people who come for relief always drink of the spring, and bathe the part afterward in the fall below. It is generally supposed that the limestone rocks communicate a virtue to it by which it cures internally; but it has been often found, that the holding a limb disordered with the evil in the strong

current of a mill tail has cured it, and there is the same advantage in the fall of this water.

LANCASHIRE, a large maritime province of England, washed by the Irish sea on the west, bordering on the north with part of Cumberland and Westmoreland; bounded on the east by the West Riding of Yorkshire, and on the west by Cheshire; extending 73 miles in length and 40 in breadth, comprehending 6 hundreds, 63 parishes, 27 market-towns, 894 villages, about 43,000 houses, and about 260,000 inhabitants.

The eastern parts of the province are rocky, and in the northern districts we see many single mountains remarkably high, such as Ingleborough hill, Clough-tobill, Pendle-hill, and Longridge-hill. Nor is there any want of wood in this country, either for timber or fuel; witness Wierdale forest and Bowland forest to the northward, and Simon's wood in the southern part of Lancashire.

This country is well watered with rivers and lakes. Among the lakes or meres of Lancashire, we reckon the Winander-merc, and the Kingstons mere, which, though neither so large nor so well stored with fish, yet affords plenty of excellent char. There was on the south side of the Ribble another lake called *Marston*, several miles in circumference, which is now drained, and converted into pasture ground. In this operation, the workmen found a great quantity of fish, together with eight canoes, resembling those of America, supposed to have been used by the ancient British fishermen. Besides these meres or lakes, this county abounds with marishes and mosses, from which the inhabitants dig excellent peat or turf for fuel, as well as marle for manuring the ground, and trunks of old fir-trees, supposed to have lain there since the general deluge. Some of these are so impregnated with turpentine, that when divided into splinters, they burn like candles, and are used for that purpose by the common people. There is a great variety of mineral waters in this county, some periodical springs, and one instance of a violent eruption of water at Kirky in Fountains. The most remarkable chalybeate spaws are those of Latham, Wigan, Stockport, Burnley, Bolton, Plumpton, Middleton, Strangeways, Laocaster, Larbrick, and Chorley. At Ancliff, in the neighbourhood of Wigan, is a fountain called the *Burning Well*, from whence a bituminous vapour exhales, which being set on fire by a candle burns like brandy, so as to produce a heat that will boil eggs to a hard consistence, while the water itself retains its original coldness\*. There is at Barton a fountain of salt-water, so strongly impregnated with the mineral, as to yield six times as much as can be extracted from the same quantity of sea-water. At Rogham, in Fountains, there is a purging saline fountain; and in the neighbourhood of Ruffal, where the ground is frequently overflowed by the sea, a stream descends from Hagbur hills, which in the space of seven years is said to convert the marle into a hard freestone fit for building. The air of Lancashire is pure, healthy, and agreeable, except among the fens and on the sea-shore, where the atmosphere is loaded with putrid exhalations, producing malignant and intermitting fevers, scurvy, rheumatism, dropsy, and consumption. The soil is various in different parts of the county, poor and rocky on the hills, fat and fertile in the valleys

\* See *Burning Well*.

Lancashire. and champaign country. The colour of the peat is white, grey, or black, according to the nature of the composition and the degree of putrefaction which the ingredients have undergone. There is a bituminous earth about Ormskirk, that smells like the oil of amber, and indeed yields an oil of the same nature, both in its scent and medicinal effects, which moreover reduces raw flesh to the consistence of mummy; this earth burns like a torch, and is used as such by the country people. The metals and minerals of this county consist of lead, iron, copper, antimony, black lead, lapis calaminaris, spar, green vitriol, alum, sulphur, pyrites, freestone, and pit and cannel coal.

The level country produces plenty of wheat and barley, and the skirts of the hills yield good harvests of excellent oats: very good hemp is raised in divers parts of the province; and the pasture which grows in the valley is so peculiarly rich, that the cattle which feed upon it are much larger and fatter than in any other part of England. There is not any part of the world better supplied than Lancashire with provisions of all kinds at a very reasonable rate; such as beef, veal, mutton, lamb, pork, poultry, and game of all sorts, caught upon the moors, heaths, and commons, in the hilly part of the shire. Besides the sea fowl common to the shires of England, such as ducks, easlerlings teal, and plover, many uncommon birds are observed on the coast of Lancashire, the sea crow, variegated with blue and black, the puffin, the cormorant, the curlew, the razor-bill, the copped wren, the red-thanks, the swan, the tropic bird, the king's-fisher, &c.

The chief manufactures of this county are woollen and cotton cloths of various kinds, tickings, and cotton velvets, for which Manchester is particularly famous. The principal rivers are the Mersey, which parts Cheshire and this county; and the Ribble, which rises in Yorkshire, and enters this county at Clithero, running south west by Preston into the Irish sea. Besides these there are many lesser streams. The navigation made by his grace the duke of Bridgewater in this county, is highly worthy of notice. This was begun so lately as about 20 years ago; it bears vessels of 60 tons burden, and is carried over two rivers, the Mersey and the Irwell. The fough, or adit, which was necessary to be made, in order to drain the water from the coal mines, is rendered navigable for boats of 6 or 7 tons burden, and forms a kind of subterraneous river, which runs about a mile and a half under ground, and communicates with the canal. This river leads to the head of the mines, is arched over with brick, and is just wide enough for the passages of the boats: at the mouth of it are two folding doors, which are closed as soon as you enter, and you then proceed by candle-light, which casts a livid gloom, serving only to make darkness visible. But this dismal gloom is rendered still more awful by the solemn echo of this subterraneous water, which returns various and discordant sounds. One while you are struck with the grating noise of engines, which by a curious contrivance let down the coals into the boats; then again you hear the shock of an explosion, occasioned by the blowing up the hard rock, which will not yield to any other force than that of gunpowder; the next minute your

ears are lulled by the songs of merriment from either Lancastrifex, who thus beguile their labours in the mine. You have no sooner reached the head of the works, than a new scene opens to your view. There you behold men and women almost in the primitive state of nature, toiling in different capacities, by the glimmering of a dim taper, some digging coal out of the bowels of the earth; some again loading it in little waggons made for the purpose; others drawing those waggons to the boats. To perfect this canal, without impeding the public roads, bridges are built over it, and where the earth has been raised to preserve the level, arches are formed under it: but what principally strikes every beholder, is a work raised near Barton-bridge, to convey the canal over the river Mersey. This is done by means of three stone arches, so spacious and lofty as to admit vessels sailing through them; and indeed nothing can be more singular and pleasing, than to observe large vessels in full sail under the aqueduct, and at the same time the duke of Bridgewater's vessels sailing over all, near fifty feet above the navigable river. By this inland navigation communication has been made with the rivers Mersey, Dee, Ribble, Ouse, Trent, Darwent, Severn, Humber, Thames, Avon, &c. which navigation, including its windings, extends above 500 miles in the counties of Lincoln, Nottingham, York, Lancaster, Westmoreland, Chester, Stafford, Warwick, Leicester, Oxford, Worcester, &c.

Lancashire was erected into a county-palatine by Edward III. who conferred it as an appendage on his son John of Ghaunt, thence called *duke of Lancaster*: but the duchy contained lands that are not in Lancashire, and among other demesnes, the palace of the Savoy, and all that district in London, which indeed belong to it at this day. The revenues of this duchy are administered by a court which sits at Westminster, and a chancery-court at Preston, which has a seal distinct from that of the county-palatine. The title of *Lancaster* distinguished the posterity of John of Ghaunt from those of his brother, who succeeded to the duchy of York, in their long and bloody contest for the crown of England.—Lancashire sends two members to parliament for the county; and 12 for the six boroughs of Lancaster, Preston, Newton, Wigan, Clitheroe, and Liverpool.

LANCASTER, the capital of the county of Lancashire in England, is pleasantly situated on the south side of the river Lun, over which there is a handsome stone-bridge. It is an ancient town, and is supposed to have been the *Longovicum* of the Romans. King John confirmed to the burgesses all the liberties he had grafted to those of Bristol; and Edward III. granted that pleas and sessions should be held here, and no where else in the county. It is governed by a mayor, recorder, 7 aldermen, 2 bailiffs, 12 capital burgesses, 12 common burgesses, a town-clerk, and 2 sergeants at mace. The assizes are held in the castle, where is also the county gaol. It trades to America with hardware and woollen manufactures in vessels of 70 tons. There is a market on Wednesday by grant, and another on Saturday by prescription, besides one every other Wednesday throughout the year for cattle; and three fairs, in May, July, and October. The castle is not large, but neat and strong. Not very long ago,

in digging a cellar, there were found several Roman utensils and vessels for sacrifices, as also the coins of the Roman emperors; so that it is supposed there was here a Roman fortress. On the top of the castle is a square tower, called *John of Gaunt's chair*, whence there is a charming prospect of the adjacent country, and especially towards the sea, where is an extensive view even to the Isle of Man. There is but one church, a fine Gothic building. It is placed on the same elevation, and from some points of view forms one group, with the castle, which gives the mind a most magnificent idea of this important place. The late considerable additional new streets and a new chapel, with other improvements, give an air of elegance and prosperity to the town; and the new bridge of 5 equal elliptical arches, in all 549 feet in length, adds not a little to the embellishments and conveniency of the place. Adjoining to the castle, the new gaol is erected on an improved plan. On the side of the hill below it, hangs a piece of a Roman wall, called *Wery-wall*. Here is a custom-house. By the late inland navigation, it has communication with the rivers Mersey, Dee, Ribble, Onse, Trent, Darwent, Severn, Humber, Thames, Avon, &c. which navigation, including its windings, extend above 500 miles in the counties of Lincoln, Nottingham, York, Westmoreland, Chester, Stafford, Warwick, Leicester, Oxford, Worcester, &c. For its peculiar government, see *Duchycourt*.

**LANCE, LANCEA**, a spear; an offensive weapon worn by the ancient cavaliers, in form of a half pike. The lance consisted of three parts, the shaft or handle, the wings, and the dart. Pliny attributes the invention of lances to the Ætoliars. But Varro and Aulus Gellius say the word lance is Spanish; whence others conclude the use of this weapon was borrowed by the people of Italy from the Spaniards. Diodorus Siculus derives it from the Gaulish, and Festus from the Greek *λανχον*, which signifies the same.

**LANCE**, in ichthyology. See **AMMODYTES**.

**LANCEOLATED LEAF**. See **BOTANY**, p. 442.

**LANCET**, a surgical instrument, sharp pointed and two-edged, chiefly used for opening veins in the operation of phlebotomy or bleeding; also for laying open abscesses, tumors, &c.

**LANCH**, a peculiar sort of long boat, used by the French, Spanish, and Italian shipping, and in general by those of other European nations when employed in voyaging in the Mediterranean sea.

A lanch is proportionably longer, lower, and more flat-bottomed than the long boat; it is by consequence less fit for sailing, but better calculated for rowing and approaching a flat shore. Its principal superiority to the long-boat, however, consists in being by its construction much fitter to under-run the cable; which is a very necessary employment in the harbours of the Levant sea, where the cables of different ships are fastened across each other, and frequently render this exercise extremely necessary.

**LANCH**, is also the movement by which a ship or boat descends from the shore, either when she is at first built, or at any time afterwards.

To facilitate the operation of lanching, and prevent any interruption therein, the ship is supported by two strong platforms, laid with a gradual inclination

to the water, on the opposite sides of her keel, to which they are parallel. Upon the surface of this declivity are placed two corresponding ranges of planks, which compose the base of a frame called the *cradle*, whose upper part envelopes the ship's bottom, whereto it is securely attached. Thus the lower surface of the cradle, conforming exactly to that of the frame below, lies flat upon it lengthwise, under the opposite sides of the ship's bottom; and as the former is intended to slide downwards upon the latter, carrying the ship along with it, the planes or faces of both are well daubed with soap and tallow.

The necessary preparations for the lanch being made, all the blocks and wedges, by which the ship was formerly supported, are driven out from under her keel, till her whole weight gradually subsides upon the platforms above described, which are accordingly called the *ways*. The shores and stanchions, by which she is retained upon the stocks till the period approaches for lanching, are at length cut away, and the screws applied to move her if necessary. The motion usually begins on the instant when the shores are cut, and the ship slides downward along the ways, which are generally prolonged under the surface of the water, to a sufficient depth to float her as soon as she arrives at the farthest end thereof.

When a ship is to be lanchd, the ensign, jack, and pendant, are always hoisted, the last being displayed from a staff erected in the middle of the ship.

Ships of the first rate are commonly constructed in dry docks, and afterwards floated out, by throwing open the flood-gates, and suffering the tide to enter as soon as they are finished.

**LANCEROTA**, one of the Canary islands, subject to Spain, and situated in W. Long. 13. 5. N. Lat. 28. 40. It is about 32 miles in length and 22 in breadth. The ancient inhabitants were negroes, very strong, active, and swift of foot. There is a ridge of hills runs quite through it, on which are fed a good number of sheep and goats. They have but few black cattle, still fewer camels, and a very few small horses. The valleys are dry and sandy, yet they produce a small quantity of wheat and barley. This island was first discovered in 1417. In 1596 it was taken by the English under the command of the earl of Cumberland; after which it was better fortified than before. There is in this island a city called also *Lancerota*, which, at the time the earl of Cumberland was there, consisted only of about 100 houses, all poor buildings, generally of one story, and covered with reeds or straw laid upon a few rafters, and over all a coat of dirt hardened by the sun. There was also a church which had no windows in it, and was supplied with light only by the door.

**LANCIANO**, a considerable town of Italy, in the kingdom of Naples, and in the Hither Abruzzo, with an archbishop's see; famous for its fairs, which are held in July and August. It is seated on the river Feltino near that of Sangro. E. Long. 15. 5. N. Lat. 42. 12.

**LANCISI** (John Marca), an eminent Italian physician, was born at Rome in 1654. From his earliest years he had a turn to natural history; and studied botany, chemistry, anatomy, and medicine, with great vigour. In 1688 Pope Innocent XI. appointed him

his physician and private chamberlain, notwithstanding his youth; and cardinal Altieri Camerlinga made him his vicar for the installation of doctors in physic, which Pope Clement XI. gave him as long as he lived, as well as continued to him the appointments conferred on him by his predecessor. He died in 1710, after giving his fine library of more than 20,000 volumes to the hospital of the Holy Ghost for the use of the public. This noble benefaction was opened in 1716, in the presence of the pope and most of the cardinals. He wrote many works which are esteemed the principal of which were collected together, and printed at Geneva in 1718, in two volumes quarto.

LANCRET (Nicholas), a French painter, born at Paris in 1690. He was the disciple of Watteau and Gillot, and painted conversations. He was indefatigable in his profession, executed with great truth after Nature, grouped his figures well, and handled a light pencil. He died in 1743.

LANCRINCK (Prosper Henry), a painter of considerable note, born in 1628, and educated in the school at Antwerp. He studied principally after Titian and Salvator Rosa; and met with encouragement in England suitable to his merit. His landscapes show a good invention, good colouring, and harmony: they are chiefly of rough rude country, with broken ground and uncommon scenery. He gave way too much to pleasure, and died in 1692.

LAND, in a general sense, denotes *terra firma*, as distinguished from *sea*.

LAND, in a limited sense, denotes arable ground. See AGRICULTURE.

LAND, in the sea-language, makes part of several compound terms; thus, *land-laid*, or, *to lay the land*, is just to lose sight of it. *Land-locked*, is when land lies all round the ship, so that no point of the compass is open to the sea. If she is at anchor in such a place, she is said to ride *land-locked*, and is therefore concluded to ride safe from the violence of the winds and tides. *Land mark*, any mountain, rock, steeple, tree, &c. that may serve to make the land known at sea. *Land is shut in*, a term used to signify that another point of land hinders the sight of that from which the ship came. *Land-to*, or the ship *lies land-to*; that is, she is so far from shore, that it can only just be discerned. *Land-turn* is a wind that in almost all hot countries blows at certain times from the shore in the night. *To set the land*; that is, to see by the compass how it bears.

*LAND-Tax*, one of the annual taxes raised upon the subject. See TAX.

The land tax, in its modern shape, has superseded all the former methods of rating either property or persons in respect of their property, whether by tenths or fifteenths, subsidies on land, hydages, scutages, or talliages; a short explication of which will, however, greatly assist us in understanding our ancient laws and history.

Tenths and fifteenths were temporary aids issuing out of personal property, and granted to the king by parliament. They were formerly the real tenth or fifteenth part of all the moveables belonging to the subject; when such moveables, or personal estates, were a very different and a much less considerable thing than what they usually are at this day. Tenths

are said to have been first granted under Henry II. who took advantage of the fashionable zeal for croifades to introduce this new taxation, in order to defray the expence of a pious expedition to Palestine, which he really or seemingly had projected against Saladin emperor of the Saracens, whence it was originally denominated the *Saladine tenth*. But afterwards fifteenths were more usually granted than tenths. Originally the amount of these taxes was uncertain, being levied by assessments new made at every fresh grant of the commons, a commission for which is preserved by Matthew Paris: but it was at length reduced to a certainty in the eighth year of Edward III. when, by virtue of the king's commission, new taxations were made of every township, borough, and city in the kingdom, and recorded in the exchequer; which rate was, at the time, the fifteenth part of the value of every township, the whole amounting to about 20,000 l. and therefore it still kept up the name of a *fifteenth*, when, by the alteration of the value of money and the increase of personal property, things came to be in a very different situation. So that when, of later years, the commons granted the king a fifteenth, every parish in England immediately knew their proportion of it; that is, the same identical sum that was assessed by the same aid in the eighth of Edward III.; and then raised it by a rate among themselves, and returned it into the royal exchequer.

The other ancient levies were in the nature of a modern land tax: for we may trace up the original of that charge as high as to the introduction of our military tenures; when every tenant of a knight's fee was bound, if called upon, to attend the king in his army for 40 days in every year. But this personal attendance growing troublesome in many respects, the tenants found means of compounding for it, by first sending others in their stead, and in process of time by making a pecuniary satisfaction to the crown in lieu of it. This pecuniary satisfaction at last came to be levied by assessments, at so much for every knight's fee, under the name of scutages; which appear to have been levied for the first time in the fifth year of Henry II. on account of his expedition to Toulouse, and were then (Sir Wm. Blackstone apprehends) mere arbitrary compositions, as the king and the subject could agree. But this precedent being afterwards abused into a means of oppression (by levying scutages on the landholders by the king's authority only, whenever our kings went to war, in order to hire mercenary troops and pay their contingent expences), it became thereupon a matter of national complaint; and King John was obliged to promise in his *magna carta*, that no scutage should be imposed without the consent of the common council of the realm.

Of the same nature with scutages upon knights-fees were the assessments of hydage upon all other lands, and of talliage upon cities and burghs. But they all gradually fell into disuse, upon the introduction of subsidies, about the time of King Richard II. and King Henry IV. These were a tax, not immediately imposed upon property, but upon persons in respect of their reputed estates, after the nominal rate of 4s. in the pound for lands, and 2s. 6d. for goods; and for those of aliens in a double proportion. But this assessment was also made according to an ancient valuation wherein

Land. wherein the computation was so very moderate, and the rental of the kingdom was supposed to be so exceeding low, that one subsidy of this sort did not, according to Sir Edward Coke, amount to more than 70,000*l.* whereas a modern land-tax at the same rate produces two millions. It was anciently the rule never to grant more than one subsidy and two fifteenths at a time: but this rule was broke through for the first time on a very pressing occasion, the Spanish invasion in 1588; when the parliament gave Queen Elizabeth two subsidies and four fifteenths. Afterwards, as money sunk in value, more subsidies were given; and we have an instance, in the first parliament of 1640, of the king's desiring 12 subsidies of the commons, to be levied in three years; which was looked upon as a startling proposal: though Lord Clarendon tells us, that the speaker, serjeant Glanville, made it manifest to the house, how very inconsiderable a sum 12 subsidies amounted to, by telling them he had computed what he was to pay for them; and when he named the sum, he being known to be possessed of a great estate, it seemed not worth any farther deliberation. And, indeed, upon calculation, we shall find, that the total amount of these 12 subsidies, to be raised in three years, is less than what is now raised in one year by a land-tax of 2*s.* in the pound.

The grant of scutages, talliages, or subsidies by the commons, did not extend to spiritual preferments; those being usually taxed at the same time by the clergy themselves in convocation: which grants of the clergy were confirmed in parliament; otherwise they were illegal, and not binding; as the same noble writer observes of the subsidies granted by the convocation, which continued sitting after the dissolution of the first parliament in 1640. A subsidy granted by the clergy was after the rate of 4*s.* in the pound, according to the valuation of their livings in the king's books; and amounted, Sir Edward Coke tells us, to about 20,000*l.* While this custom continued, convocations were wont to sit as frequently as parliaments: but the last subsidies, thus given by the clergy, were those confirmed by statute 15 Car. II. c. 10. since which another method of taxation has generally prevailed, which takes in the clergy as well as the laity: in recompense for which, the beneficed clergy have from that period been allowed to vote at the election of knights of the shire; and thenceforward also the practice of giving ecclesiastical subsidies hath fallen into total disuse.

The lay-subsidy was usually raised by commissioners appointed by the crown, or the great officers of state: and therefore in the beginning of the civil wars between Charles I. and his parliament, the latter, having no other sufficient revenue to support themselves and their measures, introduced the practice of laying weekly and monthly assessments of a specific sum upon the several counties of the kingdom; to be levied by a pound-rate on lands and personal estates: which were occasionally continued during the whole usurpation, sometimes at the rate of 120,000*l.* a month, sometimes at inferior rates. After the Restoration, the ancient method of granting subsidies, instead of such monthly assessments, was twice, and twice only, renewed; viz. in 1663, when four subsidies were granted

by the temporality and four by the clergy; and in 1670, when 800,000*l.* was raised by way of subsidy, which was the last time of raising supplies in that manner. For the monthly assessments being now established by custom, being raised by commissioners named by parliament, and producing a more certain revenue; from that time forwards we hear no more of subsidies, but occasional assessments were granted as the national emergencies required. These periodical assessments, the subsidies which preceded them, and the more ancient scutage, hydrag, and talliage, were to all intents and purposes a land-tax; and the assessments were sometimes expressly called so. Yet a popular opinion has prevailed, that the land-tax was first introduced in the reign of King William III.; because in the year 1692 a new assessment or valuation of estates was made throughout the kingdom: which, though by no means a perfect one, had this effect, that a supply of 500,000*l.* was equal to 1*s.* in the pound of the value of estates given in. And, according to this enhanced valuation, from the year 1693 to the present, a period of near a century, the land-tax has continued an annual charge upon the subject; about half the time at 4*s.* in the pound, sometimes at 3*s.* sometimes at 2*s.* twice at 1*s.* but without any total intermission. The medium has been 3*s.* 3*d.* in the pound; being equivalent to 23 ancient subsidies, and amounting annually to more than a million and a half of money. The method of raising it is by charging a particular sum upon each county, according to the valuation given in, A. D. 1692; and this sum is assessed and raised upon individuals (their personal estate, as well as real, being liable thereto), by commissioners appointed in the act, being the principal land holders in the county and their officers.

An act passes annually for the raising, in general, 2,037,627*l.* 9*s.* 10½*d.* by the above said tax at 4*s.* in the pound; whereof there shall be raised in the several counties in England, according to the proportions expressed in the act, 1,989,673*l.* 7*s.* 10½*d.*; and in Scotland, 47,954*l.* 1*s.* 2*d.* by an eight months cess of 5994*l.* 5*s.* 1½*d.* per *mensis*, to be raised out of the land-rent, and to be paid at four terms, as specified in the act, by two months amount each time.

*LAND-WAITER*, an officer of the custom-house, whose duty is, upon landing any merchandise, to examine, taste, weigh, measure them, &c. and to take an account thereof. In some ports they also execute the office of a coast-waiter. They are likewise occasionally styled *searchers*, and are to attend and join with the patent searcher in the execution of all cockets for the shipping of goods to be exported to foreign parts; and in cases where drawbacks on bounties are to be paid to the merchant on the exportation of any goods, they, as well as the patent searchers, are to certify the shipping thereof on the debentures.

*LANDAFF*, a town or village of Glamorganshire in South Wales, with a bishop's see, and on that account has the title of a *city*. It is seated upon an ascent on the river Taff, or Tave, near Cardiff; but the cathedral stands on a low ground, and is a large stately building. The original structure was built about the beginning of the 12th century. The building now used as the cathedral includes part of the

London  
||  
Landen.

Landen.

body of the ancient one; but is in other respects as modern as the present century, about the middle of which the old church underwent such reparation as was almost equivalent to rebuilding. The ruins are at the west end of the modern church, and consist of the original western door-way, and part of the north and south sides. The arch over the door is circular, and has a well carved episcopal statue immediately over it. On the upper part of the front under which this door stands is a whole length figure of the Virgin Mary, with a cross on the apex of the building. In this front are two rows of neat-pointed arches for windows; and on the north and south sides above mentioned are two circular door-cases half sunk in the earth. These ruins exhibit an aspect very different from the present cathedral, the new part of which the architect formed principally on the Roman model, without considering how incongruous this style of architecture is with the plan pursued in the ancient part.—Landaff is a place of but small extent, and has no market. It is a port town, however, and carries on a good trade, as it has a very tolerable harbour that opens into the Severn river about four miles distant. The ruins of the bishop's palace show it to have been castellated. It was built in 1120, and was destroyed by Henry IV. W. Long. 3. 20. N. Lat. 51. 33.

LANDAU, an ancient, handsome, and very strong town of France, in Lower Alsace. It was formerly imperial, and belonged to Germany, till the treaty of Munster, when it was given up to France. It is seated on the river Zurich, in a pleasant fertile country. E. Long. 8. 12. N. Lat. 49. 12.

LANDEN, a town of the Austrian Netherlands, in Brabant, famous for a battle gained over the French by the allies, in July 1693, when 20,000 men were killed. It is seated on the river Beck, in E. Long. 5. 5. N. Lat. 52. 45.

LANDEN (JOHN, F. R. S.) an eminent mathematician, was born at Peakirk, near Peterborough in Northamptonshire, in January 1719. He became very early a proficient in the mathematics, for we find him a very respectable contributor to the Ladies Diary in 1744; and he was soon among the foremost of those who then contributed to the support of that small but valuable publication, in which almost every English mathematician, who has arrived at any degree of eminence for the last half century, has contended for fame at one time of his life or other. Mr Landen continued his contributions to it at times, and under one signature or other, till within a few years of his death.

It has been frequently observed, that the histories of literary men consist chiefly of an history of their writings, and the observation was never more fully verified than it will be in this article concerning Mr Landen.

In the 48th volume of the Philosophical Transactions for the year 1754, Mr Landen gave "An investigation of some theorems which suggest several very remarkable properties of the circle, and are at the same time of considerable use in resolving fractions, the denominators of which are certain multinomials into more simple ones, and by that means facilitate the computation of fluents." This ingenious paper was handed to the Society by that eminent mathematician the late

Thomas Simpson of Woolwich, a circumstance which will convey to those who are not themselves judges of it some idea of its merit. In the year 1755, he published a volume of about 160 pages, intitled "Mathematical Lucubrations." The title to this publication was made choice of as a means of informing the world, that the study of the mathematics was at that time rather the pursuit of his leisure hours than his principal employment; and indeed it continued to be so the greatest part of his life, for about the year 1762 he was appointed agent to the right honourable the earl Fitzwilliam, and resigned that employment only two years before his death. Had it been otherwise, it seems highly probable he would have extended his researches in the mathematics, to which he was most enthusiastically devoted, much farther than any other person has done. His lucubrations contain a variety of tracts relative to the rectification of curve lines, the summation of series, the finding of fluents, and many other points in the higher parts of the mathematics. About the latter end of the year 1757, or the beginning of 1758, he published proposals for printing by subscription "The Residual Analysis, a new branch of the Algebraic art:" and in 1758 he published a small tract in quarto, intitled "A Discourse on the Residual Analysis," in which he resolved a variety of problems, to which the method of fluxions had been usually applied by a mode of reasoning entirely new; compared those solutions with solutions of the same problems, investigated by the fluxionary method; and showed that the solutions by his new method were, in general, more natural and elegant than the fluxionary ones.

In the 51st volume of the Philosophical Transactions for the year 1760, he gave "A new method of computing the sums of a great number of infinite series." This paper was also presented to the society by his ingenious friend the late Mr Thomas Simpson. In 1764, he published the first book of "The Residual Analysis," in a 4to volume of 218 pages, with several copperplates. In this treatise, besides explaining the principles which his new analysis was founded on, he applied it to drawing tangents and finding the properties of curve-lines; to describing their involutes and evolutes, finding the radius of curvature, their greatest and least ordinates, and points of contrary fluxure; to the determination of their cusps, and the drawing of asymptotes: and he proposed in a second book to extend the application of this new analysis to a great variety of mechanical and physical subjects. The papers which were to have formed this book lay long by him; but he never found leisure to put them in order for the press.

On the 16th of January 1766, Mr Landen was elected a fellow of the Royal Society, and admitted on the 24th of April following. In the 58th volume of the Philosophical Transactions for the year 1768, he gave a "Specimen of a new method of comparing curvilinear areas; by means of which many areas did not appear to be comparable by any other method;" a circumstance of no small importance in that part of natural philosophy which relates to the doctrine of motion. In the 60th volume of the same work for the year 1770, he gave "Some new theorems for com-

computing the whole areas of curve lines, where the ordinates are expressed by fractions of a certain form," in a more concise and elegant manner than had been done by Cotes, De Moivre, and others who had considered the subject before him. In the 61st volume for 1771, he has investigated several new and useful theorems for computing certain fluents, which are assignable by arcs of the conic sections. This subject had been considered before both by M. Maclaurin and Mr D'Alembert; but some of the theorems which were given by these celebrated mathematicians, being in part expressed by the difference between an arc of an hyperbola and its tangent, and that difference being not directly attainable when the arc and its tangent both become infinite, as they will do when the whole fluid is wanted, although such fluent be finite; these theorems therefore fail in those cases, and the computation becomes impracticable without farther help. This defect Mr Landen has removed by assigning the *limit* of the difference between the hyperbolic arc and its tangent, while the point of contact is supposed to be removed to an infinite distance from the vertex of the curve. And he concludes the paper with a curious and remarkable property relating to pendulous bodies, which is deducible from those theorems. In the same year he published, "Animadversions on Dr Stewart's computation of the sun's distance from the earth."

In the 65th volume of the Philosophical Transactions for 1775, he gave the investigation of a general theorem, which he had promised in 1771, for finding the length of any arc of a conic hyperbola by means of two elliptic arcs: and observes, that by the theorems there investigated, both the elastic curve and the curve of equable recess from a given point, may be constructed in those cases where Mr Maclaurin's elegant method fails. In the 67th volume for 1777, he gave "A new theory of the motion of bodies revolving about an axis in free space, when that motion is disturbed by some extraneous force, either percussive or accelerative." At this time he did not know that the subject had been handled by any person before him; and he considered only the motion of a sphere's spheroid and cylinder. The publication of this paper, however, was the cause of his being told, that the doctrine of rotatory motion had been considered by M. D'Alembert; and purchasing that author's *Opuscules Mathematiques*, he there learned that M. D'Alembert was not the only one who had considered the matter before him; for M. D'Alembert there speaks of some mathematician, though he does not mention his name, who, after reading what had been written on the subject, doubted whether there be any solid whatever, beside the sphere, in which any line, passing through its centre of gravity, will be a permanent axis of rotation. In consequence of this, Mr Landen took up the subject again; and though he did not then give a solution to the general problem, *viz.* "To determine the motions of a body of any form whatever, revolving without restraint about any axis passing through its centre of gravity," he fully removed every doubt of the kind which had been started by the person alluded to by M. D'Alembert, and pointed out several bodies, which, under certain dimensions, have that remarkable property. This paper is given, among many others

equally curious, in a volume of Memoirs which he published in the year 1780. But what renders that volume yet more valuable, is a very extensive appendix, containing "Theorems for the calculation of fluents." The tables which contain these theorems are more complete and extensive than any which are to be found in any other author, and are chiefly of his own investigating; being such as had occurred to him in the course of a long and close application to mathematical studies in almost every branch of those sciences. In 1781, 1782, and 1783, he published three little tracts on the summation of converging series, in which he explained and showed the extent of some theorems which had been given for that purpose by M. de Moivre, Mr Sterling, and his old friend Thomas Simpson, in answer to some things which he thought had been written to the disparagement of those excellent mathematicians. It was the opinion of some, that Mr Landen did not show less mathematical skill in explaining and illustrating these theorems, than he has done in his writings on original subjects; and that the authors of them were as little aware of the extent of their own theorems as the rest of the world were before Mr Landen's ingenuity made it obvious to all.

About the beginning of the year 1781, Mr Landen had made such improvements in his theory of rotatory motion, as enabled him, he thought, to give a solution of the general problem specified above; but finding the result of it to differ very materially from the result of the solution which had been given of it by M. D'Alembert, and being not able to see clearly where that gentleman had erred, he did not venture to make his own solution public. In the course of that year, having procured the Memoirs of the Berlin Academy for 1757, which contain M. Euler's solution of the problem, he found that this gentleman's solution gave the same result as had been deduced by M. D'Alembert; but the perspicuity of M. Euler's manner of writing enabled him to discover where he had erred, which the obscurity of the other did not do. The agreement, however, of two writers of such established reputation as M. Euler and M. D'Alembert made him long dubious of the truth of his own solution, and induced him to revise the process again and again with the utmost circumspection; and being every time more convinced that his own solution was right and theirs wrong, he at length gave it to the public in the 75th volume of the Philosophical Transactions for 1785.

The extreme difficulty of the subject, joined to the concise manner in which Mr Landen had been obliged to give his solution in order to confine it within proper limits for the Transactions, rendered it too difficult, or at least too laborious, a piece of business for most mathematicians to read it; and this circumstance, joined to the established reputation of Euler, induced many to think that his solution was right and Mr Landen's wrong; and there did not want attempts to prove it. But notwithstanding these attempts were manifestly wrong, and that every one who perused them saw it, they convinced Mr Landen that there was a necessity for giving his solution at greater length, in order to render it more generally understood. About this time also he met by chance with the late P. Fraſi's *Cosmographie Physique et Mathematique*; in the second part of which there is a solution of this problem, agreeing in the

Landen the result with those of M. Euler and D'Alembert, which is not surprising, as P. Frisi employs the same principle that they did. Here Mr Landen learned that M. Euler had revised the solution which he had given formerly in the Berlin Memoirs, and given it another form and at greater length in a volume published at Gryphiswell in 1765, intitled, *Theoria Motus corporum solidorum seu rigidorum*. Having therefore procured this book, Mr Landen found the same principles employed in it, and of course the same conclusion resulting from them that he had found in M. Euler's former solution of the problems: but as the reasoning was given at greater length, he was enabled to see more distinctly how M. Euler had been led into the mistake, and to set that mistake in a stronger point of view. As he had been convinced of the necessity of explaining his ideas on the subject more fully, so he now found it necessary to lose no time in setting about it. He had for several years been severely afflicted with the stone in the bladder, and toward the latter part of his life to such a degree as to be confined to his bed for more than a month at a time: yet even this dreadful disorder did not abate his ardour for mathematical studies; for the second volume of his Memoirs, just now published, was written and revised during the intervals of his disorder. This volume, beside a solution of the general problem concerning rotatory motion, contains the resolution of the problem concerning the motion of a top; an investigation of the motion of the equinoxes, in which Mr Landen has first of any one pointed out the cause of Sir Isaac Newton's mistake in his solution of this celebrated problem; and some other papers of considerable importance. He just lived to see this work finished, and received a copy of it the day before his death, which happened on the 15th of January 1790, at Milton, near Peterborough, in the 71st year of his age.

LANDERNEAU, a town of France, in Lower Bretagne, seated on the river Elboro, 20 miles east of Brest. In an inn here is a well which ebbs and flows like the sea, but at contrary times. E. Long. 4. 13. N. Lat. 48. 25.

LANDGRAVE (formed of the German *land* "earth," and *graff* or *grave*, "judge" or "count"); a name formerly given to those who executed justice in behalf of the emperors, with regard to the internal policy of the country. The title does not seem to have been used before the 11th century. These judges were first appointed within a certain district of Germany: in process of time the title became hereditary, and these judges assumed the sovereignty of the several districts or countries over which they presided. Landgrave is now applied by way of eminence to those sovereign princes of the empire who possess by inheritance certain estates called *landgravates*, and of which they receive the investiture of the emperor. There are four princes who have this title, *viz.* those of Thuringia, Hesse, Alsace, and Leuchtenberg. There are also other landgraves who are not princes but counts of the empire. See **COUNT**.

LANDGRAVIATE, or LANDGRAVATE, the office, authority, jurisdiction, or territory, of a landgrave.

LANDGUARD-FORT seems to belong to Suffolk, but is in the limits of Essex, and has a fine prospect of

the coasts of both counties. It was erected, and is maintained, for the defence of the port of Harwich over against it; for it commands the entry of it from the sea up the Maning-tree water, and will reach any ship that goes in or out. It is placed on a point of land so surrounded with the sea at high-water, that it looks like a little island at least one mile from the shore. The making its foundation solid enough for so good a fortification cost many years labour and a prodigious expence. It was built in the reign of King James I. when it was a much more considerable fortification than now, having four bastions mounted with 60 very large guns, particularly those on the royal bastion, which would throw a 28 pound ball over Harwich. Here is a small garrison, with a governor, and a platform of guns. This fort is refitted and greatly enlarged for the conveniency of the officers of ordnance, engineers, and matrosses; and a barrack built for the soldiers.

LANDISFARN, or LINDSFARN. See *Hoir-Island*.

LANDRECY, a town of the French Netherlands in Hainault, ceded to France by the treaty of the Pyrenees, and is now very well fortified. It was besieged by Prince Eugene in 1712, but to no purpose. It is seated on a plain on the river Sambre, in E. Long. 3. 47. N. Lat. 50. 4.

LANDSCAPE, in painting, the view or prospect of a country extended as far as the eye will reach. See **PAINTING**, n<sup>o</sup> 11. and 22.; and **DRAWING**, Sect. 10.

LANDSCROON, a sea-port town of Sweden, in South-Gothland, and territory of Schonen, seated on the Baltic Sea, within the Sound, 22 miles north of Copenhagen. E. Long. 14. 20. N. Lat. 55. 42.

LANDSDOWN, a place in Somersetshire, near Bath, with a fair on October 10th for cattle and cheese.

LANDSHUT, a strong town of Germany in Lower Bavaria, with a strong castle on an adjacent hill. It is seated on the river Iser, in E. Long. 1. 15. N. Lat. 48. 23. There is another small town of the same name in Silesia, and in the duchy of Schweidnitz, seated on the river Zieder, which falls into the Bauber: and there is also another in Moravia, seated on the river Morave, on the confines of Hungary and Aultria.

LANDSKIP. See **LANDSCAPE**.

LANERKSHIRE, a county of Scotland, called also *Clydesdale*, from the river Clyde, by which it is watered. It is bounded on the north by the county of Dumbarton; on the east by Stirling, Linlithgow, Edinburgh, and Peebles, shires; on the south by Dumfries; and on the west by Ayr and Renfrew shires. Its extent from north to south is about 40 miles, from east to west 36.—The river Clyde, descending from the southern part of this county, divides it into two almost equal parts; and after a course of about 50 miles, meets the tide a little below Glasgow: (see **GLASGOW**). Proceeding up the river from Glasgow, the country is rich and well cultivated. Bothwell castle, now in ruins, stands on an eminence which overlooks the Clyde. Some of its walls are still remaining, which measure 15 feet in thickness and 60 feet in height. This vast fabric was once the abode of a man the most notoriously marked of any in the annals of Scot-

Scotland for the audacity and splendor of his crimes. Between this castle and the priory of Blantyre on the opposite side of the Clyde, there is said to have been in ancient times a subterraneous passage under the river. A little above stands Bothwell-bridge, noted for the defeat of the Covenanters by the duke of Monmouth in 1679.—East from Bothwell castle, in an elevated situation, stands the Kirk of Shots, amid a wild and barren country. This dreary waste is covered with heath; and though a high situation, is flat, and very marshy in many places. It is chiefly employed as sheep-walks; and notwithstanding the vicinity of coal and lime, seems scarce capable of cultivation. This want is, however, compensated by the abundance of iron-stone and coal, which are here brought together by the hand of nature. Nor is this advantage confined to the barren tract in the north-east corner of the shire. The whole county abounds with these valuable minerals; and two iron works are erected on the banks of the Clyde, one a little above Glasgow and another at Cleland near Hamilton. But the most considerable work of this kind in the county is that of Clough, a few miles south-east from the Kirk of Shots. A village is here built for the accommodation of the workmen. It is called *Wilsontown* from the name of the proprietors.—The small borough of Lanerk is situated on the brow of a hill, on the north-east side of the Clyde, commanding a fine prospect over the river. In this neighbourhood are some of the greatest cotton manufactories in Scotland. The Clyde near this place runs for several miles between high rocks covered with wood; and in its course exhibits many astonishing cataracts: (see the article CLYDE).—From Lanerk, passing the village of Carstairs, a few miles to the east we meet the small town of Carnwath. In this neighbourhood, and along the Clyde to the south-east, there is much cultivation and rich pasture.—To the south of Carnwath is the town of Biggar; where is seen the ruin of a collegiate church founded in 1545.—The lands about the villages of Couler and Lamington are fertile; but farther up the Clyde we meet with nothing but sheep-walks and pasture-grounds in tracing it to its source.

In the southern part of the shire, generally called Clydesdale, the country is not less wild. Among the mountains here, or rather in a hollow near their summit, we meet with the village of Leadhills, by some said to be the highest human habitation in the island of Great Britain. Here, however, reside many hundreds of miners with their families. These miners, though in a great measure excluded from society by their situation, yet not only find means to procure a comfortable subsistence, but also pay more attention to the cultivation of the mind than many of their countrymen situated seemingly in more favourable circumstances for the attainment of knowledge. As an evidence of this, they are very intelligent, and have provided a circulating library for the instruction and amusement of the little community belonging to the village.—Amid these mountains particles of gold have sometimes been found washed down by the rains and streams of water; but this desert tract is chiefly valuable for producing metals of inferior worth. “Nothing (says Mr Pennant) can equal the gloomy appear-

ance of the country round. Neither tree, nor shrub, nor verdure, nor picturesque rock, appear to amuse the eye. The spectator must plunge into the bowels of these mountains for entertainment.” The veins of lead lie mostly north and south; and their thickness, which seldom exceeds 40 feet, varies greatly in different parts. Some have been found filled with ore within two fathoms of the surface; others sink to the depth of 90 fathoms. The earl of Hopeton, the proprietor, has in his possession a solid mass of lead ore from these mines weighing five tons. His lordship has also, it is said a piece of native gold that weighs two ounces, which was found here. The lead smelted at this place is all sent to Leith, where it has the privilege of being exported free of duty. The scanty pasture afforded by this barren region feeds some sheep and cattle; but those in the neighbourhood of the mines sometimes perish by drinking of the water in which the lead ore has been washed: for the lead-ore communicates a deleterious quality to the water, though that liquid acquires no hurtful taint from remaining in leaden pipes or cisterns. North from this mountainous region lies Crawfordmuir.

About nine miles north of Leadhills, on the east side of the small river Douglas, which falls into the Clyde a few miles below. stands Douglas castle, for many ages the residence of the second family in Scotland. A modern building has been erected on the same site, in imitation of the ancient castle. Near it stands the town of Douglas. A few miles to the north-east is Tinto, a remarkable conic mountain, round the base of which the Clyde makes a noble sweep. Westward, beyond Douglas, the small river Netham descends into the Clyde through the populous parish of Lismahago.—Hamilton house, the seat of the duke of Hamilton, stands in a plain between the rivers Clyde and Avon. It is a magnificent structure, surrounded by many venerable oaks. In the vicinity is the town of Hamilton, which contains many handsome houses: (see HAMILTON). Here are seen the ruins of a collegiate church, founded in 1451. At a little distance from Hamilton-house is an elegant appendage to it called *Chatelherault*, the name of the ancient possessions held by the family in France. This building is seated on the river Avon, and is surrounded by woods and deep dells, and every rural beauty that can produce a pleasing effect on the imagination.—On the west of Hamilton is the little town of Kilbride; and to the south that of Strathavon, surrounded by the fertile tract from which it derives its name. In our way from Hamilton to Glasgow we meet with the ancient borough of Rutherglen, inhabited chiefly by weavers and other manufacturers: and the village of Govan stands on the same side of the river on the road from Glasgow to Renfrew.

LANESBOROUGH, a town of Ireland, situated in the county of Longford and province of Leinster. It is a borough, and returns two members to parliament; patronage in the Dillon family. This place is situated on the river Shannon, 62 miles from Dublin; and has a barracks for a troop of horse. There is a yearly fair here in February. The town gave title of *viscount* to the family of Lane, and now gives title of *earl* to that of Butler. There is a bridge over the

Lanark-

shire

Langeland.

Shannon at Laneshborough into the county Roscom-  
mon. N. Lat. 53. 40. W. Long. 8. 6.

LANFRANC, an Italian, born at Pavia, became archbishop of Canterbury in 1070. He disputed against Berengarius in the council held at Rome in 1059, and wrote against him concerning the real presence in the eucharist. He had other disputes, &c. and died in 1089.

LANFRANC (John), an eminent Italian history painter, born at Parma in 1581. He was first the disciple of Augustin Caracci; and, after his death, of Hannibal, whose taste in design and colouring he so happily attained, that he was intrusted to execute some of his designs in the Farnesian palace at Rome. These he finished in so masterly a manner, that the difference is imperceptible to this day between his work and that of his master. His genius directed him to grand compositions, which he had a peculiar facility in designing and in painting either in fresco or in oil: he did indeed aspire to the grace of Correggio, but could never arrive at his excellence; his greatest power being manifested in composition and fore-shortening. He was deficient in correctness and expression; and his colouring, though sometimes admirable, was frequently too dark. By order of Pope Urban VIII. he painted in St Peter's church at Rome the representation of that saint walking on the water, which afforded the pope so much satisfaction that he knighted him. He died in 1647.

LANGBAINE (Gerard), D. D. a learned English writer, was born in 1608. He was educated at Queen's-college, Oxford; and became keeper of the archives of that university, provost of his college, and doctor of divinity. He was highly esteemed by archbishop Usher, Selden, and several other learned men; and died in 1657-8. He published, 1. An edition of Longinus, in Greek and Latin, with notes. 2. A review of the covenant; and other works.

LANGBAINE, (Gerard), an eminent writer, the son of the former, was born in 1656. He was put apprentice to Mr Symonds, bookseller in St Paul's church yard: but was soon after called from thence by his mother upon the death of his eldest brother, and by her entered a gentleman-commoner of University-college, Oxford, in 1672. Here he run out a good part of his estate; but afterwards corrected his manner of living, and for some years lived in retirement near Oxford. During this time he improved his taste for dramatic poetry; and at first wrote some small pieces without his name, but afterwards published several works which he publicly owned. In 1690 he was elected inferior beadle of arts in the university of Oxford; and, in January following, was chosen superior beadle of law, but died soon after in 1692. He wrote, 1. The hunter, a discourse on horsemanship. 2. A new catalogue of English plays, with their best editions, and divers remarks on the originals of most plays, and on the plagiaries of several authors. 3. An account of the English dramatic poets.

LANGELAND (Robert), an old English poet of the 14th century, and one of the first disciples of Wickliffe the reformer. He is said to have been born in Shropshire, but we have no account of his family. He wrote *The visions of Pierce Plowman*; a piece

N<sup>o</sup> 174.

which abounds with imagination and humour, though dressed to great disadvantage in very uncouth verification and obsolete language. It is written without rhyme, an ornament which the poet has endeavoured to supply by making every verse begin with the same letter. Dr Hickes observes, that this kind of alliterative verification was adopted by Langeland from the practice of the Saxon poets, and that these visions abound with Saxonisms: he styles him *celeberrimus ille fatiographus, morum vindex acerrimus*, &c. Chaucer and Spencer have attempted imitations of his visions, and the learned Selden mentions him with honour.

LANGELAND, an island of Denmark in the Baltic sea, in the strait called *the great belt*, and between Zealand, Saland, and Fyonia. It produces plenty of corn, and the principal town is Rutcoping. E. Long. 11. 10. N. Lat. 55. 0.

LANGETZ, a town of France in Touraine, noted for its excellent melons. It is seated on the river Loire, in E. Long. 0. 23. N. Lat. 42. 20.

LANGHORNE (John), D. D. was born at Kirkby-Stephen in Westmoreland. His father was the reverend Joseph Langhorne of Winton, who died when his son was young. After entering into holy orders, he became tutor to the sons of Mr Cracroft, a Lincolnshire gentleman, whose daughter he married. This lady in a short time died: and the loss of her was very pathetically lamented by her husband in a monody; and by another gentleman, Mr Cartwright, in a poem intitled "Constantia." Dr Langhorne held the living of Blagden in Somersetshire at the time of his death, which happened April 1. 1779. He was the author of several literary productions; amongst others, of Poems in 2 vols, 1766; Sermons in 2 vols, 1773; Effusions of Fancy, 2 vols; Theodosius and Constantia, 2 vols; Solyman and Almena; Frederick and Pharamond, or the Consolations of Human Life, 1769; a Dissertation on the Eloquence of the Pulpit; and another on Religious Retirement; and he was editor of the Works of St Evremond, of the Poems of Collins, and some other articles.

LANGIONA, a large, rich, and strong town of Asia, capital of the kingdom of Laos, with a large and magnificent palace where the king resides. E. Long. 96. 45. N. Lat. 22. 38.

LANGOBARDI, a people of Germany situated between the Elbe and the Oder, in the Marche of Brandenburg, whom their paucity ennobled; in regard that being encompassed by many and powerful nations they preserved themselves, not so much by submission, as by dint of arms and encountering dangers, (Tacitus).

LANGPORT, in Somersetshire, 132 miles from London, is a well-frequented town on the Parrot, between Bridgewater and Crewkern. It sent members to three parliaments, and is governed by a portreeve and a recorder. Here are lighters constantly fetching coals, &c. from Bridgewater; and it is a stage for the Taunton waggon, which drops the goods here from London to be carried farther by water. Eels are taken in vast plenty out of the holes of the banks of the river in frosty weather. The market here is on Saturday, and there are four fairs in the year.

LANGRELSHOT, at sea, that consisting of two bars of iron joined by a chain or shackle, and having

half a ball of iron fixed on each end; by means of which apparatus it does great execution among the enemy's rigging.

LANGRES, an ancient and considerable town of France in Champagne, with a bishop's see. The cutlery-wares made here are in high esteem. It is seated on a mountain near the river Mearne, in E. Long. 4. 24. N. Lat. 47. 52.

LANGTON (Stephen), was born in England, but educated at Paris, and was greatly esteemed for his learning by the king and nobility of France. He was chancellor of Paris, a cardinal of Rome, and in the reign of king John was made archbishop of Canterbury by Pope Innocent III. in opposition both to the monks of Canterbury and to the king. Langton was one of the most illustrious men of his age for learning; and continued archbishop 22 years, dying in 1228. A catalogue of his books is given by Bale and Tanner.

LANGUAGE, in the proper sense of the word, signifies the expression of our ideas and their various relations by certain articulate sounds, which are used as the signs of those ideas and relations. By articulate sounds are meant those modulations of simple voice, or of sound emitted from the thorax, which are formed by means of the mouth and its several organs, the teeth, the tongue, the lips, and the palate. In a more general sense the word *language* is sometimes used to denote all sounds by which animals of any kind express their particular feelings and impulses in a manner that is intelligible to their own species.

Nature has endowed every animal with powers sufficient to make known all those of its sensations and desires, with which it is necessary, for the preservation of the individual or the continuance of the kind, that others of the same species should be acquainted. For this purpose, the organs of all vocal animals are so formed, as, upon any particular impulse, to utter sounds, of which those of the same species instinctively know the meaning. The summons of the hen is instantly obeyed by the whole brood of chickens; and in many others of the irrational tribes a similar mode of communication may be observed between the parents and the offspring, and between one animal and its customary associate. But it is not among animals of the same species only that these instinctive sounds are mutually understood. It is as necessary for animals to know the voices of their enemies as the voices of their friends; and the roaring of the lion is a sound of which, previous to all experience, every beast of the forest is naturally afraid. Between these animal voices and the language of men there is however very little analogy. Human language is capable of expressing ideas and notions, which there is every reason to believe that the brutal mind cannot conceive. "Speech (says Aristotle) is made to indicate what is expedient and what inexpedient, and in consequence of this what is just and unjust. It is therefore given to men; because it is peculiar to them that of good and evil, just and unjust, they only (with respect to other animals) possess a sense or feeling." The voices of brutes seem intended by nature to express, not distinct ideas or moral modes, but only such feelings as it is for the good of the species that they should have the power of making known; and in this, as in all other respects, these voices are analogous; not to our speaking, but to our weeping,

laughing, singing, groaning, screaming, and other natural and audible expressions of appetite and passion.

—Another difference between the language of men and the voices of brute animals consists in articulation, by which the former may be resolved into distinct elementary sounds or syllables; whereas the latter, being for the most part unarticulated, is not capable of such a resolution. Hence Homer and Hesiod characterize man by the epithet *εργετός* or "voice dividing," as denoting a power peculiar to the human species: for though there are a few birds † which utter sounds that may be divided into syllables, yet each of these birds utters but one such sound, which seems to be employed rather as notes of natural music than for the purpose of giving information to others; for when the bird is agitated, it utters cries which are very different, and have no articulation.—A third difference between the language of men and the significant cries of brute animals, is, that the former is from art and the latter from nature. Every human language is learned by imitation, and is intelligible only to those who either inhabit the country where it is vernacular, or have been taught it by a teacher or by books: but the voices in question are not learned by imitation; and being wholly instinctive, they are intelligible to all the animals of that species by which they are uttered, though brought together from the most distant countries on earth. That a dog, which had never heard another bark, would notwithstanding bark himself, and that the baskings or yelps of a Lapland dog would be instinctively understood by the dogs of Spain, Calabria, or any other country, are facts which admit not of doubt: but there is no reason to imagine that a man who had never heard any language spoken would himself speak; and it is well known that the language spoken in one country is unintelligible to the natives of another country where a different language is spoken. Herodotus indeed records a fact which, could it be depended upon, would tend to overturn this reasoning, as it infers a natural relation between ideas and certain articulate sounds. He tells us, that Psammetichus king of Egypt, in order to discover which was the oldest language, caused two children, newly born of poor parents, to be brought up by a shepherd among his cattle, with a strict injunction that they should never hear a human voice; and that at the end of two years the children pronounced at the same time the word *βρεακος*, which in the Phrygian language signified *bread*. Either this is one of the many fables which that credulous historian collected among the Egyptians, or the conduct and reasoning of Psammetichus were very absurd; for it is added, that from this circumstance he inferred that the Phrygians were the most ancient people, and that they spoke the primitive language. The only rational purpose for which such an experiment could be instituted, would be to discover, not which is the oldest or the latest language, but whether there be such a thing as a language of nature or instinct: but in such a language it is obvious that there could be no word to denote *bread*, because in what is called the state of nature bread is unknown. The experiment of Psammetichus was probably never made; but in the woods of different countries solitary savages have at different times been caught, who, though they apparently possessed all the sagacity which is natural to man, and though

Language.

† The parrot, cuckoo, and East-India bird called *cockatoe*, &c.

Not from nature or instinct, but

Language their organs both of hearing and of speech were perfect, never used articulate sounds as signs of sensations or ideas. They uttered indeed the inarticulate cries which are instinctively expressive of pleasure and pain, of joy and sorrow, more distinctly and forcibly than men civilized; but with respect to the very rudiments of language, they were what Horace represents all mankind to have been originally,—*mutum et turpe pecus*. Indeed it seems to be obvious, that were there any instinctive language, the first words uttered by all children would be the same; and that every child, whether born in the desert or in society, would understand the language of every other child however educated or however neglected. Nay more, we may venture to affirm, that such a language, though its general use might, in society, be superseded by the prevailing dialect of art, could never be wholly lost; and that no man of one country would find it difficult, far less impossible, to communicate the knowledge of his natural and most pressing wants to the men of any other country, whether barbarous or civilized. The exercise of cultivated reason, and the arts of civil life, have indeed eradicated many of our original instincts, but they have not eradicated them all: (see INSTINCT.) There are external indications of the internal feelings and desires, which appear in the most polished society, and which are confessedly instinctive. The passions, emotions, sensations, and appetites, are naturally expressed in the countenance by characters which the savage and the courtier can read with equal readiness. The look serene, the smoothed brow, the dimpled smile, and the gliding eye, denote equanimity and good will in terms which no man mistakes. The contracted brow, the glaring eye, the sullen gloom, and the threatening air, denote rage, indignation, and defiance, as plainly and forcibly as revivings or imprecations. To teach men to disguise these instinctive indications of their temper, and

“To carry smiles and sunshine in their face,  
“When discontent sits heavy at their heart;”

constitutes a great part of modern and refined education. Yet in spite of every effort of the utmost skill, and of every motive resulting from interest, the most consummate hypocrite, or the most hackneyed politician, is not always able to prevent his real disposition from becoming apparent in his countenance. He may indeed, by long practice, have acquired a very great command both over his temper and over the instinctive signs of it; but at times nature will predominate over art, and a sudden and violent passion will flash in his face, so as to be visible to the eye of every beholder. If these observations be just, and we flatter ourselves with the belief that no man will call them in question, it seems to follow, that, if mankind were prompted by instinct to use articulate sounds as indications of their passions, affections, sensations, and ideas, the language of nature could never be wholly forgotten, and that it would sometimes predominate over the language of art. Groans, sighs, and some inarticulate lively sounds, are naturally expressive of pain and pleasure, and equally intelligible to all man-

kind. The occasional use of these no art can wholly banish; and if there were articulate sounds naturally expressive of the same feelings, it is not conceivable that art or education could banish the use of them, merely because by the organs of the mouth they are broken into parts and resolvable into syllables.

It being thus evident that there is no instinctive articulated language, it has become an inquiry of some importance, how mankind were first induced to fabricate articulate sounds, and to employ them for the purpose of communicating their thoughts. Children learn to speak by insensible imitation; and when advanced some years in life, they study foreign languages under proper instructors: but the first men had no speakers to imitate, and no formed language to study; by what means then did they learn to speak? On this question only two opinions can possibly be formed. Either language must have been originally revealed from heaven, or it must be the fruit of human industry. The greater part of Jews and Christians, and even some of the wisest pagans, have embraced the former opinion; which seems to be supported by the authority of Moses, who represents the Supreme Being as teaching our first parents the names of animals. The latter opinion is held by Diodorus Siculus, Lucretius, Horace, and many other Greek and Roman writers, who consider language as one of the arts invented by man. The first men, say they, lived for some time in woods and caves after the manner of beasts, uttering only confused and indistinct noises; till, associating for mutual assistance, they came by degrees to use articulate sounds mutually agreed upon for the arbitrary signs or marks of those ideas in the mind of the speaker which he wanted to communicate to the hearer. This opinion sprung from the atomic cosmogony which was framed by Mochus the Phœnician, and afterwards improved by Democritus and Epicurus; and though it is part of a system in which the first men are represented as having grown out of the earth like trees and other vegetables, it has been adopted by several modern writers (A) of high rank in the republic of letters, and is certainly in itself worthy of examination.

The most learned, and on every account the most respectable author who now supports this opinion, candidly acknowledges, that if language was invented, it was of very difficult invention, and far beyond the reach of the grossest savages. Accordingly he holds, that though men were originally solitary animals, and had no natural propensity to the social life; yet before language could be invented they must have been associated for ages, and have carried on of concert some common work. Nay, he is decidedly of opinion, that before the invention of an art so difficult as language, men must not only have herded together, but have also formed some kind of civil polity, have existed in that political state a very long time, and have acquired such powers of abstraction as to be able to form general ideas. (See LOGIC and METAPHYSICS). But it is obvious, that men could not have instituted civil polity, or have carried on of concert any common work, without communicating their designs to each other: and there are four ways by which the author thinks that this could have

(A) Father Simon, Voltaire, L'Abbe Condillac, Dr Smith, and the author of *the Origin and Progress of Language*.

language have been done before the invention of speech; viz. 1st, *inarticulate cries*, expressive of sentiments and passions; 2d, *gestures*, and *the expression of countenance*; 3d, *imitative sounds* expressive of audible things; and, 4th, *painting*, by which visible objects may be represented. Of these four ways of communication it is plain that only two have any connection with language, viz. *inarticulate cries* and *imitative sounds*; and of these the author abandons the latter as having contributed nothing to the invention of articulation, though he thinks it may have helped to advance its progress. "I am disposed (says he) to believe, that the framing of words with an analogy to the sound of the things expressed by them belongs rather to languages of art than to the first languages spoken by rude and barbarous nations." It is therefore *inarticulate cries* only that must have given rise to the formation of language. Such cries are used by all animals who have any use of voice to express their wants; and the fact is, that all barbarous nations have cries expressing different things, such as joy, grief, terror, surprise, and the like. These, together with gestures and expression of the countenance, were undoubtedly the methods of communication first used by men: and we have but to suppose (says our author) a great number of our species carrying on some common business, and conversing together by signs and cries; and we have men just in a state proper for the invention of language. For if we suppose their numbers to increase, their wants would increase also; and then these two methods of communication would become too confined for that larger sphere of life which their wants would make necessary. The only thing then that remained to be done was to give a greater variety to the instinctive cries; and as the natural progress is from what is easy to what is more difficult, the first variation would be merely by tones from low to high, and from grave to acute. But this variety could not answer all the purposes of speech in society; and being advanced so far, it was natural that an animal so sagacious as man should go on farther, and come at last to the only other variation remaining, namely articulation. The first articulation would be very simple, the voice being broken and distinguished only by a few vowels and consonants. And as all natural cries are from the throat and larynx, with little or no operation of the organs of the mouth, it is natural to suppose, that the first languages were for the greater part spoken from the throat; that what consonants were used to vary the cries, were mostly guttural; and that the organs of the mouth would at first be very little employed. From this account of the origin of language it appears, that the first sounds articulated were the natural cries by which men signified their wants and desires to one another, such as calling one another for certain purposes, and other such things as were most necessary for carrying on any joint work: then in process of time other cries would be articulated, to signify, that such and such actions had been performed or were performing, or that such and such events had happened relative to the common business. Then names would be invented of such objects as they were conversant with; but as we cannot suppose sa-

vages to be deep in abstraction or skilful in the art of Language. arranging things according to their *genera* and *species*, all things however similar, except perhaps the individuals of the lowest species, would be expressed by different words not related to each other either by derivation or composition. Thus would language grow by degrees; and as it grew, it would be more and more broken and articulated by consonants; but still the words would retain a great deal of their original nature of animal cries. And thus things would go on, words unrelated still multiplying, till at last the language would become too cumbersome for use; and then art would be obliged to interpose, and form a language upon a few radical words, according to the rules and method of etymology.

Those (B) who think that language was originally revealed from heaven, consider this account of its human invention as a series of mere suppositions hanging loosely together, and the whole suspended from no fixed principle. The opinions of Diodorus, Vitruvius, Horace, Lucretius, and Cicero, which are frequently quoted in its support, are in their estimation of no greater authority than the opinions of other men; for as language was formed and brought to a great degree of perfection long before the era of any historian with whom we are acquainted, the antiquity of the Greek and Roman writers, who are comparatively of yesterday, gives them no advantage in this inquiry over the philosophers of France and England. Aristotle has defined man to be ζῷον μιλῆτικόν: and the definition is certainly so far just, that man is much more remarkable for imitation than invention; and therefore, say the reasoners on this side of the question, had the human race been originally *mutum et turpe pecus*, they would have continued so to the end of time, unless they had been taught to speak by some superior intelligence. That the first men sprung from the earth like vegetables, no modern philosopher has ventured to assert; nor does there any where appear sufficient evidence that men were originally in the state of savages. The oldest book extant contains the only rational cosmogony known to the ancient nations; and that book represents the first human inhabitants of this earth, not only as reasoning and speaking animals, but also as in a state of high perfection and happiness, of which they were deprived for disobedience to their Creator. Moses, setting aside his claim to inspiration, deserves, from the consistency of his narrative, at least as much credit as Mochus, or Democritus, or Epicurus; and from his prior antiquity, if antiquity could on this subject have any weight, he would deserve more, as having lived nearer to the period of which they all write. But the question respecting the origin of language may be decided without resting in authority of any kind, merely by considering the nature of speech and the mental and corporeal powers of man. Those who maintain it to be of human invention, suppose men at first to have been solitary animals, afterwards to have herded together without government or subordination, then to have formed political societies, and by their own exertions to have advanced from the grossest ignorance to the refinements of science. But, say the reasoners

(B) Warburton, Delaney, Johnson, Beattie, Blair, and Dr Stanhope Smith of New Jersey, &c.

Language. whose cause we are now pleading, this is a supposition contrary to all history and all experience. There is not upon record a single instance well authenticated of a people emerging by their own efforts from barbarism to civilization. There have indeed been many nations raised from the state of savages; but it is known that they were polished, not by their own repeated exertions, but by the influence of individuals or colonies from nations more enlightened than themselves. The original savages of Greece were tamed by the Pelasgi, a foreign tribe; and were afterwards further polished by Orpheus, Cecrops, Cadmus, &c. who derived their knowledge from Egypt and the East. The ancient Romans, a ferocious and motley crew, received the blessings of law and religion from a succession of foreign kings; and the conquests of Rome at a later period contributed to civilize the rest of Europe. In America, the only two nations which at the invasion of the Spaniards could be said to have advanced a single step from barbarism, were indebted for their superiority over the other tribes, not to the gradual and unassisted progress of the human mind, but to the wise institutions of foreign legislators.

This is not the proper place for tracing the progress of man from the savage state to that of political society (See *Savage State*); but experience teaches us, that in every art it is much easier to improve than to invent. The human mind, when put into the proper track, is indeed capable of making great advances in arts and sciences; but if any credit be due to the records of history, it has not, in a people sunk in ignorance and barbarity, sufficient vigour to discover that track, or to conceive a state different from the present. If the rudest inhabitants of America and other countries have continued, as there is every reason to believe they have continued, for ages in the same unvaried state of barbarism; how is it imaginable that people so much ruder than they, as to be ignorant of all language, should think of inventing an art so difficult as that of speech, or even to frame a conception of the thing? In building, fishing, hunting, navigating, &c. they might imitate the instinctive arts of other animals; but there is no other animal that expresses its sensations and affections by arbitrary articulate sounds.—It is said, that before language could be invented, mankind must have existed for ages in large political societies, and have carried on of concert some common work: but if inarticulate cries, and the natural visible signs of the passions and affections, were modes of communication sufficiently accurate to keep a large society together for ages, and to direct its members in the execution of some common work, what could be their inducement to the invention of an art so useless and difficult as that of language? Let us however suppose, say the advocates for the cause which we are now supporting, that different nations of savages set about inventing an art of communicating their thoughts, which experience had taught them was not absolutely necessary; how came they all, without exception, to think of the one art of articulating the voice for this purpose? Inarticulate cries, out of which language is fabricated, have indeed an instinctive connection with our passions and affections; but there are gestures and expressions of countenance with which our passions and affections are in the same manner connected. If the natural

cries of passion could be so modified and enlarged as to be capable of communicating to the hearer every idea in the mind of the speaker, it is certain that the natural gestures could be so modified as to answer the very same purpose (see *Pantomimi*); and it is strange that among the several nations who invented languages, not one should have stumbled upon fabricating visible signs of their ideas, but that all should have agreed to denote them by articulated sounds. Every nation whose language is narrow and rude supplies its defects by violent gesticulation; and therefore, as much less genius is exerted in the improvement of any art than was requisite for its first invention, it is natural to suppose, that, had men been left to devise for themselves a method of communicating their thoughts, they would not have attempted any other than that by which they now improve the language transmitted by their fathers. It is vain to urge that articulate sounds are fitter for the purpose of communicating thought than visible gesticulation: for though this may be true, it is a truth which could hardly occur to savages, who had never experienced the fitness of either; and if, to counterbalance the superior fitness of articulation, its extreme difficulty be taken into view, it must appear little less than miraculous that every savage tribe should think of it rather than the easier method of artificial gesticulation. Savages, it is well known, are remarkable for their indolence, and for always preferring ease to utility; but their modes of life give such a pliancy to their bodies, that they could with very little trouble bend their limbs and members into any positions agreed upon as the signs of ideas. This is so far from being the case with respect to the organs of articulation, that it is with extreme difficulty, if at all, that a man advanced in life can be taught to articulate any sound which he has not been accustomed to hear. No foreigner who comes to England after the age of thirty, ever pronounces the language tolerably well; an Englishman of that age can hardly be taught to utter the guttural sound which a Scotchman gives to the Greek  $\chi$ , or even the French sound of the vowel  $v$ : and of the solitary savages who have been caught in different forests, we know not that there has been one who, after the age of manhood, learned to articulate any language so as to make himself readily understood. The present age has indeed furnished many instances of deaf persons being taught to speak intelligibly by skilful masters moulding the organs of the mouth into the positions proper for articulating the voice; but who was to perform this task among the inventors of language, when all mankind were equally ignorant of the means by which articulation is effected? In a word, daily experience informs us, that men who have not learned to articulate in their childhood, never afterwards acquire the faculty of speech but by such helps as savages cannot obtain; and therefore, if speech was invented at all, it must have been either by children who were incapable of invention, or by men who were incapable of speech. A thousand, nay a million, of children could not think of inventing a language. While the organs are pliable, there is not understanding enough to frame the conception of a language; and by the time that there is understanding, the organs are become too stiff for the task. And therefore, say the advocates for the divine origin of language, reason as well!

language well as history intimates, that mankind in all ages must have been speaking animals; the young having constantly acquired this art by imitating those who were elder; and we may warrantably conclude, that our first parents received it by immediate inspiration.

To this account of the origin of language an objection readily offers itself. If the first language was communicated by inspiration, it must have been perfect, and held in reverence by those who spoke it, *i. e.* by all mankind. But a vast variety of languages have prevailed in the world; and some of these which remain are known to be very imperfect, whilst there is reason to believe that many others are lost. If different languages were originally invented by different nations, all this would naturally follow from the mixture of these nations; but what could induce men possessed of one perfect language of divine original, to forsake it for barbarous jargons of their own invention, and in every respect inferior to that with which their forefathers or themselves had been inspired?

In answer to this objection, it is said, that nothing was given by inspiration but the faculty of speech and the elements of language; for when once men had language, it is easy to conceive how they might have modified it by their natural powers, as thousands can improve what they could not invent. The first language, if given by inspiration, must in its principles have had all the perfection of which language is susceptible; but from the nature of things it could not possibly be very copious. The words of language are either proper names or the signs of ideas and relations; but it cannot be supposed that the All-wise Instructor would load the memories of men with words to denote things then unknown, or with the signs of ideas which they had not then acquired. It was sufficient that a foundation was laid of such a nature as would support the largest superstructure which they might ever after have occasion to raise upon it, and that they were taught the method of building by composition and derivation. This would long preserve the language radically the same, though it could not prevent the introduction of different dialects in the different countries over which men spread themselves. In whatever region we suppose the human race to have been originally placed, the increase of their numbers would in process of time either disperse them into different nations, or extend the one nation to a vast distance on all sides from what we may call the seat of government. In either case they would every where meet with new objects, which would occasion the invention of new names; and as the difference of climate and other natural causes would compel those who removed eastward or northward to adopt modes of life in many respects different from the modes of those who travelled towards the west or the south, a vast number of words would in one country be fabricated to denote complex conceptions, which must necessarily be unintelligible to the body of the people inhabiting countries where those conceptions had never been formed. Thus would various dialects be unavoidably introduced into the original language, even whilst all mankind remained in one society and under one government. But after separate and independent societies were formed, these variations would become more numerous, and the several dialects would deviate farther and farther from each other, as well as from the idiom and genius of

the parent tongue, in proportion to the distance of the tribes by whom they were spoken. If we suppose a few people either to have been banished together from the society of their brethren, or to have wandered of their own accord to a distance, from which through trackless forests they could not return (and such emigrations have often taken place), it is easy to see how the most copious language must in their mouths have soon become narrow, and how the offspring of inspiration must have in time become so deformed as hardly to retain a feature of the ancestor whence it originally sprung. Men do not long retain a practical skill in those arts which they never exercise; and there are abundance of facts to prove, that a single man cast upon a desert island, and having to provide the necessaries of life by his own ingenuity, would soon lose the art of speaking with fluency his mother-tongue. A small number of men cast away together, would indeed retain that art somewhat longer; but in a space of time not very long, it would in a great measure be lost by them or their posterity. In this state of banishment, as their time would be almost wholly occupied in hunting, fishing, and other means within their reach to support a wretched existence, they would have very little leisure, and perhaps less desire, to preserve by conversation the remembrance of that ease and those comforts of which they now found themselves for ever deprived; and they would of course soon forget all the words which in their native language had been used to denote the accommodations and elegancies of polished life. This at least seems to be certain, that they would not attempt to teach their children a part of language which in their circumstances could be of no use to them, and of which it would be impossible to make them comprehend the meaning; for where there are no ideas the signs of ideas cannot be made intelligible. From such colonies as this dispersed over the earth, it is probable that all those nations of savages have arisen, which have induced so many philosophers to imagine that the state of the savage was the original state of man; and if so, we see that from the language of inspiration must have unavoidably sprung a number of different dialects all extremely rude and narrow, and retaining nothing of the parent tongue, except perhaps the names of the most conspicuous objects of nature, and of those wants and enjoyments which are inseparable from humanity. The savage state has no artificial wants, and furnishes few ideas that require terms to express them. The habits of solitude and silence incline a savage rarely to speak; and when he speaks, he uses the same terms to denote different ideas. Speech therefore, in this rude condition of men, must be extremely narrow and extremely various. Every new region, and every new climate, suggests different ideas, and creates different wants, which must be expressed either by terms entirely new or by old terms used with a new signification. Hence must originate great diversity, even in the first elements of speech, among all savage nations, the words retained of the original language being used in various senses, and pronounced, as we may believe, with various accents. When any of those savage tribes emerged from their barbarism, whether by their own efforts or by the aid of people more enlightened than themselves, it is obvious that the improvement and copiousness of their language

Language. would keep pace with their own progress in knowledge and in the arts of civil life; but in the infinite multitude of words which civilization and refinement add to language, it would be little less than miraculous were any two nations to agree upon the same sounds to represent the same ideas. Superior refinement, indeed, may induce imitation, conquests may impose a language, and extension of empires may melt down different nations and different dialects into one mass; but independent tribes naturally give rise to diversity of tongues, nor does it seem possible that they should retain more of the original language than the words expressive of those objects with which all men are at all times equally concerned.

The variety of tongues, therefore, the copiousness of some, and the narrowness of others, furnish no good objection to the divine origin of language in general; for whether language was at first revealed from heaven, or in a course of ages invented by men, a multitude of dialects would inevitably arise as soon as the human race was separated into a number of distinct and independent nations.—We pretend not to decide for our readers in a question of this nature: we have given the best arguments on both sides which we could either devise or find in the writings of others: and if it be seen, as we doubt not it will, that our own judgment leans to the side of revelation, let it not be hastily condemned by those whose knowledge of languages extends no farther than to Greece and Rome, and France and England; for if they will carry their philological inquiries to the east, they may perhaps be able to trace the remains of one original language through a great part of the globe at this day (c).

Language, whatever was its origin, must be subject to perpetual changes from its very nature, as well as

from that variety of incidents which affect all sublunary things; and those changes must always correspond with the change of circumstances in the people by whom the language is spoken. When any particular set of ideas becomes prevalent among any society of men, words must be adopted to express them; and from these the language must assume its character. Hence the language of a brave and martial people is bold and nervous, although perhaps rude and uncultivated; while the languages of those nations in which luxury and effeminacy prevail, are flowing and harmonious, but devoid of force and energy of expression.

But although it may be considered as a general rule, that the language of any people is a very exact index of the state of their minds, yet it admits of some particular exceptions. For as man is naturally an imitative animal, and in matters of this kind never has recourse to invention but through necessity, colonies planted by any nation, at whatever distance from the mother country, always retain the same general sounds and *idiom* of language with those from whom they are separated. In process of time, however, the colonists and the people of the mother-country, by living under different climates, by being engaged in different occupations, and by adopting, of course, different modes of life, may lose all knowledge of one another, assume different national characters, and form each a distinct language to themselves, totally different in genius and style, though agreeing with one another in the fundamental sounds and general idiom. If, therefore, this particular idiom, formed before their separation, happen to be more peculiarly adapted to the genius of the mother-country than of the colonies, these will labour under an inconvenience on this account, which they may never be wholly able to overcome; and this

(c) Numberless instances of this might be given, but our limits will permit us to produce only a very few. In the *Shanscrit*, or ancient language of the *Gentoo*s, *our* signifies a *day*: (See *Halbed's preface to the code of Gentoo laws*). In other eastern languages, the same word was used to denote both *light* and *fire*. Thus in the *Chaldee*, *ur* is *fire*; in the *Egyptian*, *or* is the *sun* or *light*, (*Plut. de Osir. et Isis.*): In the *Hebrew*, *aur* is *light*: in the *Greek*, *air* is the *air*, often *light*: in *Latin*, *aura* is the *air*, from the *Æolic Greek*; and in *Irish* it is *AEAR*. From the very same original we have the *Greek* word *aur*, and the *English fire*.—In *Hebrew*, *or* signifies to *raise*, *lift up one's self*, or *be raised*: hence plainly are derived the *Greek or*, to *raise*, *exalt*, and the *Latin orior* to *arise*; whence *Oriens* the *east*, and *Eng. orient*, *oriental*; also *Lat. origo*, and *Eng. origin*, *originate*, &c.—The word *Khunt* in the *Shanscrit* dialect, signifies a *small territory*, which is retained in *Kubos*, *Kent*, *Canton*, *Cantabria*. The word *Khan*, *kin*, *cean*, *gan*, *gen*, *gin*, is of the same kind, and pervades *Asia* and *Europe* from the *Ganges* to the *Garrone*. The word *light* *English*, *LUCHT* *Flemish*, *LUX* *Roman*, and *λυχος* *Greek*, has been traced to *Egypt*. *ARETZ*, *AREK*, *ERECH*, *HERTHA*, *EARTH*, and *ERDE*, are all one word from *Palestine* and *Chaldee* to *Britain* and *Germany*.—The *Chaldeans* turned the *Hebrew* word *shur* or *shor*, which signifies an *ox*, into *thor*, as likewise did the *Phenicians* (See *Plut. Vit. Syll.*); hence the *Greek ταυρος*, the *Latin taurus*, the *French taureau*, and the *Italian* and *Spanish toro*. The *Hebrew* word *bit* or *beith*, which signifies *cavity*, *capacity*, the *conceave* or *inside* of any place, has spread itself far and wide, still retaining nearly the original signification; in the *Persian* language it is *BAD*, *BED*, *BHAD*, and signifies a *house* or *abode*. In all the dialects of the *Gothic* tongue, *RODE* signifies the same thing; hence the *English abide*, *abode*, *booth*, *boat*, and the *French batteau*. In all these instances there is a striking resemblance in sound as well as in sense between the derived and the primitive words; but this is not always the case, even when of the legitimacy of the derivation no doubt can be entertained. It has been shown (see *Boswell's Life of Johnson*), that the *French jour*, a *day*, is derived from the *Latin dies*; but it may be certainly traced from a higher source. In many of the oriental dialects, *DI*, *bright*, is a name of the *sun*; hence the *Greek Δις*, *Jupiter*, and the *Latin dies*, a *day*. From *DIES* comes *DIURNUS*; in the pronunciation of which, either by the inaccuracy of the speaker or of the hearer, *diu* is readily confounded with *giu*; then of the ablative of this adjective, corruptly pronounced *giurno*, the *Italians* make a substantive *GIORNO*, which by the *French* is readily contracted into *GIOUR* or *JOUR*. From the same root *DI*, comes *Διός*, *α*, *ο*, the *Æolic Διός*, the *Latin DIUS*, and the *Celtic DHIA*, *God*.

inconvenience must prevent their language from ever attaining to that degree of perfection to which, by the genius of the people, it might otherwise have been carried. Thus various languages may have been formed out of one parent tongue; and thus that happy concurrence of circumstances which has raised some languages to a high degree of perfection, may be easily accounted for, while many ineffectual efforts have been made to raise other languages to the same degree of excellence.

As the knowledge of languages constitutes a great part of erudition, as their beauty and deformities furnish employment to taste, and as these depend much upon the idioms of the different tongues, we shall proceed to make a few remarks upon the advantages and defects of some of those idioms of language with which we are best acquainted.—As the words *IDIOM* and *GENIUS* of a language are often confounded, it will be necessary to inform the reader, that by *IDIOM* we would here be understood to mean that *general mode of arranging words into sentences which prevails in any particular language*; and by the *GENIUS* of a language, we mean to express *the particular set of ideas which the words of any language, either from their formation or multiplicity, are most naturally apt to excite in the mind of any one who hears it properly uttered*. Thus, although the *English, French, Italian, and Spanish* languages nearly agree in the same general *IDIOM*, yet the particular *GENIUS* of each is remarkably different: The *English* is naturally bold, nervous, and strongly articulated; the *French* is weaker, and more flowing; the *Italian* more soothing and harmonious; and the *Spanish* more grave, sonorous, and flatly. Now, when we examine the several languages which have been most esteemed in Europe, we find that there are only two *IDIOMS* among them which are essentially distinguished from one another; and all those languages are divided between these two idioms, following sometimes the one and sometimes the other, either wholly or in part. The languages which may be said to adhere to the first *IDIOM*, are those which in their construction follow the order of nature; that is, express their ideas in the natural order in which they occur to the mind; the subject which occasions the action appearing first; then the action, accompanied with its several modifications; and, last of all, the object to which it has reference.—These may properly be called *ANALOGOUS* languages; and of this kind are the *English, French, and most of the modern languages in Europe*.—The languages which may be referred to the other *IDIOM*, are those which follow no other order in their construction than what the taste or fancy of the composer may suggest; sometimes making the object, sometimes the action, and sometimes the modification of the action, to precede or follow the other parts. The confusion which this might occasion, is avoided by the particular manner of *inflecting* their words, by which they are made to refer to the others with which they ought to be connected, in whatever part of the sentence they occur, the mind being left at liberty to connect the several parts with one another after the whole sentence is concluded. And as the words may be here transposed at pleasure, those languages may be called *TRANSPOSITIVE* languages. To this class we must, in an especial manner, refer the *Latin and Greek lan-*

guages.—As each of these *IDIOMS* has several advantages and defects peculiar to itself, we shall endeavour to point out the most considerable of them, in order to ascertain with greater precision the particular character and excellence of some of those languages now principally spoken or studied in Europe.

The partiality which our forefathers, at the revival of letters in Europe, naturally entertained for the Greek and Roman languages, made them look upon every distinguishing peculiarity belonging to them as *one of the many causes of the amazing superiority* which those languages evidently enjoyed above every other at that time spoken in Europe.—This blind deference still continues to be paid to them, as our minds are early prepossessed with these ideas, and as we are taught in our earliest infancy to believe, that to entertain the least idea of our own language being equal to the Greek or Latin in any particular whatever, would be a certain mark of ignorance or want of taste.—Their rights, therefore, like those of the church in former ages, remain still to be examined; and we, without exerting our reason to discover truth from falsehood, tamely sit down satisfied with the idea of their undoubted pre-eminence in every respect. But if we look around us for a moment, and observe the many excellent productions which are to be met with in almost every language of Europe, we must be satisfied, that *even these* are now possessed of *some* powers which might afford at least a presumption, that, if they were cultivated with a proper degree of attention, they might, in *some respects*, be made to rival, if not to excel, those beautiful and justly admired remains of antiquity. Without endeavouring to derogate from their merit, let us, with the cool eye of philosophic reasoning, endeavour to bring before the sacred tribunal of Truth some of those opinions which have been most generally received upon this subject, and rest the determination of the cause on her impartial decision.

The learned reader well knows, that the several changes which take place in the arrangement of the words in every *TRANSPOSITIVE* language, could not be admitted without occasioning great confusion, unless certain classes of words were endowed with particular variations, by means of which they might be made to refer to the other words with which they ought naturally to be connected. From this cause proceeds the necessity of several variations of *verbs, nouns, and adjectives*; which are not in the least essential or necessary in the *ANALOGOUS* languages, as we have pretty fully explained under the article *GRAMMAR*, to which we refer for satisfaction on this head. We shall in this place consider, whether these variations are an advantage or a disadvantage to language.

As it is generally supposed, that every language whose verbs admit of *inflection*, is on that account much more perfect than one where they are varied by *auxiliaries*; we shall, in the first place, examine this with some degree of attention; and that what is said on this head may be the more intelligible, we shall give examples from the Latin and English languages. We make choice of these languages, because the Latin is more purely *transpositive* than the Greek, and the English admits of less *inflection* than any other language that we are acquainted with.

If any preference be due to a language from the

Language.

<sup>14</sup> The transpositive languages compared with respect to

Language. one or the other method of *conjugating* verbs, it must in a great measure be owing to one or more of these three causes:—Either it must admit of a greater variety of sounds, and consequently more room for harmonious diversity of tones in the language:—or a greater freedom of expression is allowed in uttering any simple idea, by the one admitting of a greater variety in the arrangement of the words which are necessary to express that idea than the other does:—or, lastly, a greater precision and accuracy in fixing the meaning of the person who uses the language, arise from the use of one of these forms, than from the use of the other: for, as every other circumstance which may serve to give a diversity to language, such as the general and most prevalent sounds, the frequent repetition of any one particular letter, and a variety of other circumstances of that nature, which may serve to debase a particular language, are not influenced in the least by the different methods of varying the verbs, they cannot be here considered. We shall therefore proceed to make a comparison of the advantages or disadvantages which may accrue to a language by inflecting its verbs with regard to each of these particulars,—variety of sound, variety of arrangement, and accuracy of meaning.

15  
Diversity of sounds, variety of expressions, and precision of meaning.

The first particular that we have to examine is, Whether the one method of expressing the variations of a verb admits of a greater variety of sounds? In this respect the *Latin* seems, at first view, to have a great advantage over the *English*: for the words *amo, amabam, amaveram, amavero, amem*, &c. seem to be more different from one another than the English translations of these. *I love, I did love, I had loved, I shall have loved. I may love*, &c.; for although the syllable *AM* is repeated in every one of the first, yet as the last syllable usually strikes the ear with greater force, and leaves a greater impression than the first, it is very probable that many will think the frequent repetition of the word *LOVE* in the last instance, more striking to the ear than the repetition of *am* in the former. We will therefore allow this its full weight, and grant that there is as great, or even a greater difference between the sounds of the different *tenfes* of a Latin verb, than there is between the words that are equivalent to them in English. But as we here consider the variety of sounds of the language in general, before any just conclusion can be drawn, we must not only compare the different parts of the same verb, but also compare the different verbs with one another in each of these languages. And here, at first view, we perceive a most striking distinction in favour of the *analogous* language over the *inflected*: for as it would be impossible to form a particular set of inflections different from one another for each particular verb, all those languages which have adopted this method have been obliged to reduce their verbs into a small number of classes; all the words of each of which classes, commonly called *conjugations*, have the several variations of the *modes, tenfes, and persons*, expressed exactly in the same manner, which must of necessity introduce a similarity of sounds into the language in general, much greater than where every particular verb always retains its own distinguishing sound. To be convinced of this, we need only repeat any number of verbs in Latin and English, and observe on which side the preference with respect to variety of sounds must fall.

N<sup>o</sup> 174.

Pono,	<i>I put.</i>	Moveo,	<i>I move.</i>
Dono,	<i>I give.</i>	Doleo,	<i>I ail.</i>
Cano,	<i>I sing.</i>	Lugeo,	<i>I mourn.</i>
Sono,	<i>I found.</i>	Obeo,	<i>I die.</i>
Orno,	<i>I adorn.</i>	Gaudeo,	<i>I rejoice.</i>
Pugno,	<i>I fight.</i>	Incipio,	<i>I begin.</i>
Lego,	<i>I read.</i>	Facio,	<i>I make.</i>
Scribo,	<i>I write.</i>	Fodio,	<i>I dig.</i>
Puto,	<i>I think.</i>	Rideo,	<i>I laugh.</i>
Vivo,	<i>I live.</i>	Impleo,	<i>I fill.</i>
Ambulo,	<i>I walk.</i>	Abstineo,	<i>I forbear.</i>

Language

The similarity of sounds is here so obvious in the Latin, as to be perceived at the first glance; nor can we be surpris'd to find it so, when we consider that all their regular verbs, amounting to 4000 or upwards, must be reduced to four conjugations, and even these differing but little from one another, which must of necessity produce the sameness of sounds which we here perceive; whereas, every language that follows the natural order, like the English, instead of this small number of uniform terminations, have almost as many distinct sounds as original verbs in their language.

But if, instead of the present of the indicative mood, we should take almost any other tense of the Latin verb, the similarity of sounds would be still more perceptible, as many of these tenses have the same termination in all the four conjugations, particularly in the imperfect of the indicative, as below.

Pone-bam;	<i>I did put,</i>	<i>I put.</i>
Dona-bam;	<i>I did give,</i>	<i>I gave.</i>
Cane-bam;	<i>I did sing,</i>	<i>I sung.</i>
Sona-bam;	<i>I did found,</i>	<i>I found.</i>
Orna-bam;	<i>I did adorn,</i>	<i>I adorned.</i>
Pugna-bam;	<i>I did fight,</i>	<i>I fought.</i>
Lege-bam;	<i>I did read,</i>	<i>I read.</i>
Scribe-bam;	<i>I did write,</i>	<i>I wrote.</i>
Put-a-bam;	<i>I did think,</i>	<i>I thought.</i>
Vive-bam;	<i>I did live,</i>	<i>I lived.</i>
Ambula-bam;	<i>I did walk,</i>	<i>I walked.</i>
Move-bam;	<i>I did move,</i>	<i>I moved.</i>
Dole-bam;	<i>I did ail,</i>	<i>I ailed.</i>
Luge-bam;	<i>I did mourn,</i>	<i>I mourned.</i>
Obi-bam;	<i>I did die,</i>	<i>I died.</i>
Gaude-bam;	<i>I did rejoice,</i>	<i>I rejoiced.</i>
Incipie-bam;	<i>I did begin,</i>	<i>I began.</i>
Facie-bam;	<i>I did make,</i>	<i>I made.</i>
Fodie-bam;	<i>I did dig,</i>	<i>I dug.</i>
Ride-bam;	<i>I did laugh,</i>	<i>I laughed.</i>
Imple-bam;	<i>I did fill,</i>	<i>I filled.</i>
Abstine-bam;	<i>I did forbear,</i>	<i>I forbore.</i>

It is unnecessary to make any remarks on the Latin words in this example: but in the English translation we have carefully marked in the first column the words without any inflection; and in the second, have put down the same meaning by an inflection of our verb; which we have been enabled to do, from a peculiar excellency in our own language unknown to any other either ancient or modern. Were it necessary to pursue this subject farther, we might observe, that the *perfect* tense in all the conjugations ends universally in *I*, the *pluperfect* in *ERAM*, and the *future* in *AM* or *BO*; in the subjunctive mood, the *imperfect* universally in *REM*, the *perfect* in *ERIM*, the *pluperfect* in *ISEM*, and the

age. the future in ERO: and as a still greater sameness is observable in the different variations for the persons in these tenses, seeing the first person plural in all tenses ends in MUS, and the second person in TIS, with little variation in the other persons; it is evident that, in respect of diversity of sounds, this method of conjugating verbs by inflection, is greatly inferior to the more natural method of expressing the various connections and relations of the verbal attributive by different words, usually called auxiliaries.

The second particular, by which the different methods of marking the relation of the verbal attributive can affect language, arises from the variety of expressions which either of these may admit of in uttering the same sentiment. In this respect, likewise, the method of conjugating by inflection seems to be deficient. Thus the present of the indicative mood in Latin can at most be expressed only in two ways, viz. SCRIBO, and EGO SCRIBO; which ought perhaps in strictness to be admitted only as one: whereas, in English, we can vary it in four different ways, viz. 1<sup>st</sup>, I WRITE; 2<sup>dly</sup>, I DO WRITE; 3<sup>dly</sup>, WRITE I DO; 4<sup>thly</sup>, WRITE DO I (D). And if we consider the further variation which these receive in power as well as in sound, by having the emphasis placed on the different words; instead of four, we will find eleven different variations: thus, 1<sup>st</sup>, I write, with the emphasis upon the I;—2<sup>dly</sup>, I WRITE, with the emphasis upon the word WRITE. Let any one pronounce these with the different emphasis necessary, and he will be immediately satisfied that they are not only distinct from each other with respect to meaning, but also with regard to sound; and the same must be understood of all the other parts of this example.

- |                |                 |
|----------------|-----------------|
| 3. I do write, | 8. Write I do,  |
| 4. I do write, | 9. WRITE do I,  |
| 5. I do WRITE, | 10. Write do I, |
| 6. WRITE I do, | 11. Write do I. |
| 7. Write I do, |                 |

None of the Latin tenses admit of more variations than the two above mentioned: nor do almost any of the English admit of fewer than in the above example; and several of these phrases, which must be considered as exact translations of some of the tenses of the Latin verb, admit of many more. Thus the imperfect of the subjunctive mood, which in Latin admits of the above two variations, admits in English of the following:

- |                          |                          |
|--------------------------|--------------------------|
| 1. I might have written. | 4. Written might have I. |
| 2. Written I might have. | 5. I written might have. |
| 3. Have written I might. | 6. Have written might I. |

VOL. IX. Part II.

And if we likewise consider the variations which may be produced by a variation of the emphasis, they will be as under.

- |                           |                           |
|---------------------------|---------------------------|
| 1. I might have written.  | 13. WRITTEN might have I. |
| 2. I MIGHT have written.  | 14. Written MIGHT have I. |
| 3. I might HAVE written.  | 15. Written might HAVE I. |
| 4. I might have WRITTEN.  | 16. Written might have I. |
| 5. WRITTEN I might have.  | 17. I written might have. |
| 6. Written I might have.  | 18. I WRITTEN might have. |
| 7. Written I MIGHT have.  | 19. I written MIGHT have. |
| 8. Written I might HAVE.  | 20. I written might HAVE. |
| 9. HAVE written I might.  | 21. HAVE written might I. |
| 10. HAVE WRITTEN I might. | 22. HAVE WRITTEN might I. |
| 11. Have written I might. | 23. Have written MIGHT I. |
| 12. Have written I MIGHT. | 24. Have written might I. |

In all 24 variations, instead of two.—If we likewise consider, that the Latins were obliged to employ the same word, not only to express “I might have written, but also, “I could, I would, or I should have written;” each of which would admit of the same variations as the word might; we have in all ninety-six different expressions in English for the same phrase which in Latin admits only of two, unless they have recourse to other forced turns of expression, which the defects of their verbs in this particular has compelled them to invent.

But if it should be objected, that the last circumstance we have taken notice of as a defect, can only be considered as a defect of the Latin language, and is not to be attributed to the inflection of their verbs, seeing they might have had a particular tense for each of these different words might, could, would, and should; we answer, that, even admitting this excuse as valid, the superiority of the analogous language, as such, still remains in this respect as 12 to 1.—Yet even this concession is greater than ought to have been made: For as the difficulty of forming a sufficient variety of words for all the different modifications which a verb may be made to undergo is too great for any rude people to overcome; we find, that every nation which has adopted this mode of inflection, not excepting the Greeks themselves, has been obliged to remain satisfied with fewer words than would have been necessary even to effect this purpose, and make the same word serve a double, treble, or even quadruple office, as in the Latin tense which gave rise to these observations: So that, however in physical necessity this may not be chargeable upon this particular mode of construction, yet in moral certainty it must always be the case; and therefore we may safely conclude, that the mode of varying verbs by inflection affords less variety in the arrangement of the words of the particular phrases, than

3 Y

(D) We are sufficiently aware, that the last variation cannot in strictness be considered as good language; although many examples of this manner of using it in serious compositions, both in poetry and prose, might be easily produced from the best authors in the English language.—But however unjustifiable it may be to use it in serious composition; yet, when judiciously employed in works of humour, this and other forced expressions of the like nature produce a fine effect, by giving a burlesque air to the language, and beautifully contrasting it to the purer diction of solid reasoning. The sagacious Shakespeare has, on many occasions, showed how successfully these may be employed in composition, particularly in drawing the character of ancient Pistol in Henry V. Without this liberty, Butler would have found greater difficulty in drawing the inimitable character of Hudibras.—Let this apology suffice for our having inserted this and other variations of the same kind; which, although they may be often improper for serious composition, have still their use in language.

Language. than the method of varying them by the help of auxiliaries.

18 Precision of meaning, in which the English is superior to the Latin language. But if there should still remain any shadow of doubt in the mind of the reader, whether the method of varying the verbs by *inflection* is inferior to that by *auxiliaries*, with regard to diversity of sounds, or variety of expression; there cannot be the least doubt, but that with respect to precision, distinctness, and accuracy, in expressing any idea, the latter enjoys a superiority beyond all comparison.—Thus the Latin verb *Amo*, may be Englished either by the words, *I love*, or *I do love*, and the emphasis placed upon any of the words that the circumstances may require; by means of which the meaning is pointed out with a force and energy which it is altogether impossible to produce by the use of any single word. The following line from Shakespear's *Othello* may serve as an example:

———— Excellent wretch!

Perdition catch my soul, but *I do love* thee:

In which the strong emphasis upon the word *do*, gives it a force and energy which conveys, in an irresistible manner, a most perfect knowledge of the situation of the mind of the speaker at the time.—That the whole energy of the expression depends upon this seemingly insignificant word, we may be at once satisfied of, by keeping it away in this manner:

———— Excellent wretch!

Perdition catch my soul, but *I love* thee.

How poor—how tame—how insignificant is this, when compared with the other! Here nothing remains but a tame assertion, ushered in with a pompous exclamation which could not here be introduced with any degree of propriety. Whereas, in the way that Shakespear has left it to us, it has an energy which nothing can surpass; for, overpowered with the irresistible force of Desdemona's charms, this strong exclamation is extorted from the soul of Othello in spite of himself. Surprised at this tender emotion, which brings to his mind all those amiable qualities for which he had so much esteemed her, and at the same time fully impressed with the firm persuasion of her guilt, he bursts out into that seemingly inconsistent exclamation, *Excellent wretch!* and then he adds in the warmth of his surprise,—thinking it a thing most astonishing that any warmth of affection should still remain in his breast, he even confirms it with an oath,—*Perdition catch my soul, but I do love thee.*—“In spite of all the falsehoods with which I know thou hast deceived me—in spite of all the crimes of which I know thee guilty—in spite of all those reasons for which I ought to hate thee—in spite of myself,—still I find that I love,—yes, I do love thee.” We look upon it as a thing altogether impossible to transfuse the energy of this expression into any language whose verbs are regularly inflected.

In the same manner we might go through all the other tenses, and show that the same superiority is to be found in each.—Thus, in the *perfect tense* of the Latins, instead of the simple *AMAVI*, we say, *I HAVE LOVED*; and by the liberty we have of putting the emphasis upon any of the words which compose this phrase, we can in the most accurate manner fix the precise idea which we mean to excite: for if we say,

*I have loved*, with the emphasis upon the word *I*, it at once points out the person as the principal object in that phrase, and makes us naturally look for a contrast in some other person, and the other parts of the phrase becomes subordinate to it;—“*HE has loved* thee much, but *I have loved* thee infinitely more.” The Latins too, as they were not prohibited from joining the pronoun with their verb, were also acquainted with this excellence, which Virgil has beautifully used in this verse:

———— Nos patriam fugimus;

*Tu, Tityre, lentus in umbra, &c.*

But *we* are not only enabled thus to distinguish the person in as powerful a manner as the Latins, but can also with the same facility point out any of the other circumstances as principals; for if we say, with the emphasis upon the word *have*, “*I HAVE loved*,” it as naturally points out the time as the principal object, and makes us look for a contrast in that peculiarity, *I HAVE*: “*I have loved* indeed;—my imagination *has* been led astray—my reason *has* been perverted:—but, *now* that time has opened my eyes, I can smile at those imaginary distresses which once perplexed me.”—In the same manner we can put the emphasis upon the other word of the phrase *loved*, —“*I have LOVED*.”—Here the passion is exhibited as the principal circumstance; and as this can never be excited without some object, we naturally wish to know the object of that passion—“Who! what have you *loved*?” are the natural questions we would put in this case. “*I have LOVED*—Eliza.”—In this manner we are, on all occasions, enabled to express, with the utmost precision, that particular idea which we would wish to excite, so as to give an energy and perspicuity to the language, which can never be attained by those languages whose verbs are conjugated by *inflection*: and if to this we add the inconvenience which all inflected languages are subject to, by having too small a number of tenses, so as to be compelled to make one word on many occasions supply the place of two, three, or even four, the balance is turned still more in our favour.—Thus, in Latin, the same word *AMABO* stands for *shall* or *will love*, so that the reader is left to guess from the context which of the two meanings it was most likely the writer had in view.—In the same manner, *may* or *can love* are expressed by the same word *AMEM*; as are also *might*, *could*, *would*, or *should love*, by the single word *AMAREM*, as we have already observed; so that the reader is left to guess which of these four meanings the writer intended to express: which occasions a perplexity very different from that clear precision which our language allows of, by not only pointing out the different words, but also by allowing us to put the emphasis upon any of them we please, which superadds energy and force to the precision it would have had without that assistance.

Upon the whole, therefore, after the most candid examination, we must conclude, that the method of conjugating verbs by *inflection* is inferior to that which is performed by the help of *auxiliaries*;—because it does not afford such a diversity of sounds,—nor allow such variety in the arrangement of expression for the same thought,—nor give so great distinction and precision in the meaning.—It is, however, attended

uage. attended with one considerable advantage above the other method: for as the words of which it is formed are necessarily of greater length, and more sonorous, than in the analogous languages, it admits of a more flowing harmony of expression; for the number of monosyllables in this last greatly checks that pompous dignity which naturally results from longer words. Whether this single advantage is sufficient to counterbalance all the other defects with which it is attended, is left to the judgment of the reader to determine:—but we may remark, before we quit the subject, that even this excellence is attended with some peculiar inconveniences, which shall be more particularly pointed out in the sequel.

But perhaps it might still be objected, that although the comparison we have made above may be fair, and the conclusion just, with regard to the Latin and English languages; yet it does not appear clear, that on that account the method of conjugating verbs by *inflection* is inferior to that by *auxiliaries*; for although it be allowed that the Latin language is defective in point of tenses; yet if a language were formed which had a sufficient number of inflected tenses to answer every purpose; if it had, for instance, a word properly formed for every variation of each tense; one for *I love*, another for *I do love*; one for *I shall*, another for *I will love*; one for *I might*, another for *I could*, and *would*, and *should love*; and so on through all the other tenses; that this language would not be liable to the objections we have brought against the inflection of verbs; and that of course, the objections we have brought are only valid against those languages which have followed that mode and executed it imperfectly.

—We answer, that although this would in some measure remedy the evil, yet it would not remove it entirely. For, in the first place, unless every verb, or every small number of verbs, were conjugated in one way, having the sound of the words in each tense, and division of tenses, as we may say different from all the other conjugations,—it would always occasion a sameness of sound, which would in some measure prevent that variety of sounds so proper for a language. And even if this could be effected, it would not give such a latitude to the expression as auxiliaries allow: for although there should be two words, one for *I might*, and another for *I could love*; yet as these are single words, they cannot be varied; whereas, by auxiliaries, either of these can be varied 24 different ways, as has been shown above. In the last place, no single word can ever express all that variety of meaning which we can do by the help of our auxiliaries and the emphasis. *I have loved*, if expressed by any one word, could only denote at all times one distinct meaning; so that to give it the power of ours, three distinct words at least would be necessary. However, if all this were done; that is, if there were a distinct conjugation formed for

every 40 or 50 verbs:—if each of the tenses were properly formed, and all of them different from every other tense as well as every other verb; and these all carried through each of the different persons, so as to be all different from one another;—and if likewise there were a distinct word to mark each of the separate meanings which the same tense could be made to assume by means of the emphasis; and if all this infinite variety of words could be formed in a distinct manner, different from each other, and harmonious; this language would have powers greater than any that could be formed by auxiliaries, if it were possible for the human powers to acquire such a degree of knowledge as to be able to employ it with facility. But how could this be attained, since upwards of ten thousand words would be necessary to form the variations of any one verb, and a hundred times that number would not include the knowledge of the verbs alone of such a language (ε)!—How much, therefore, ought we to admire the simple perspicuity of our language, which enables us, by the proper application of ten or twelve seemingly trifling words, the meaning and use of which can be attained with the utmost ease, to express all that could be expressed by this unwieldy apparatus? What can equal the simplicity or the power of the one method, but the well-known powers of the 24 letters, the knowledge of which can be obtained with so much ease—and their powers know no limits?—or, what can be compared to the fancied perfection of the other, but the transcript of it which the Chinese seem to have formed in their unintelligible language?

Having thus considered pretty fully the advantages and defects of each of these two methods of varying verbs, we cannot help feeling a secret wish arise in our mind, that there had been a people sagacious enough to have united the powers of the one method with those of the other; nor can we help being surprised, that among the changes which took place in the several languages of Europe after the downfall of the Roman monarchy, some of them did not accidentally stumble on the method of doing it. From many concurring circumstances, it seems probable that the greatest part, if not all the Gothic nations that overran Italy at that time, had their verbs varied by the help of auxiliaries; and many of the modern European languages which have sprang from them, have so far borrowed from the Latin, as to have some of the tenses of their verbs inflected: yet the English alone have in any instance combined the joint powers of the two: which could only be done by forming inflections for the different tenses in the same manner as the Latins, and at the same time retaining the original method of varying them by auxiliaries; by which means either the one or the other method could have been employed as occasion required. We have luckily two tenses formed

(ε) This assertion may perhaps appear to many very much exaggerated: but if any should think so, we only beg the favour that he will set himself to mark all the variations of tenses, mode, person, and number, which an English verb can be made to assume, varying each of these in every way that it will admit, both as to the diversity of expression and the emphasis; he will soon be convinced that we have here said nothing more than enough.

**Language.** in that way; the *present* of the indicative, and the aorist of the *past*. In almost all our verbs these can be declined either with or without auxiliaries. Thus the present, without an auxiliary, is, *I love, I write, I speak*; with an auxiliary, *I do write, I do love, I do speak*. In the same manner, the past tense, by inflection, is, *I loved, I wrote, I spoke*; by auxiliaries, *I did love, I did speak, I did write*. Every author, who knows any thing of the power of the English language, knows the use which may be made of this distinction. What a pity is it that we should have slept short so soon! how blind was it in so many other nations to imitate the defects, without making a proper use of that beautiful language which is now numbered among the dead!

cases of  
nouns.

After the verbs, the next most considerable variation we find between the *analogous* and *transpositive* languages is in the nouns; the latter varying the different cases of these by *inflection*; whereas the former express all the different variations of them by the help of other words prefixed, called *prepositions*. Now, if we consider the advantages or disadvantages of either of these methods under the same heads as we have done the verbs, we shall find, that with regard to the first particular, viz. variety of sounds, almost the same remarks may be made as upon the verbs; for if we compare any particular noun by itself, the variety of sound appears much greater between the different cases in the *transpositive*, than between the translation of these in the *analogous* language. Thus *RIX, REGIS, REGI, REGEM, &c.* are more distinct from one another in point of sound, than the translation of these, *a king, of a king, to a king, a king, &c.* But if we proceed one step further, and consider the variety which is produced in the language *in general* by the one or the other of these methods, the case is entirely reversed. For as it would have been impossible to form distinct variations, different from one another, for each case of every noun, they have been obliged to reduce all their nouns into a few general classes, called *declensions*, and to give to all those included under each class the same termination in every case; which produces a like similarity of sound with what we already observed was occasioned to the verbs from the same cause; whereas in the analogous languages, as there is no necessity for any constraint, there is almost as great a variety of sounds as their are of nouns. The Latins have only five different declensions; so that all the great number of words of this general order must be reduced to the very small diversity of sounds which these few classes admit of; and even the sounds of these few classes are not so much diversified as they might have been, as many of the different *cases* in the different *declensions* have exactly the same sounds, as we shall have occasion to remark more fully hereafter. We might here produce examples to show the great *similarity* of sounds between different nouns in the Latin language, and *variety* in the English, in the same way as we did of the verbs: but as every reader in the least acquainted with these two languages can satisfy himself in this particular, without any further trouble than by marking down any number of Latin nouns, with their translations into English, we think it unnecessary to dwell longer on this particular.

But if the inflection of nouns is a disadvantage to a language in point of diversity of sounds, it is very

much the reverse with regard to the variety it allows in the arranging the words of the phrase. Here, indeed, the transpositive language shines forth in all its glory, and the analogous must yield the palm without the smallest dispute. For as the *nominative case* (or that noun which is the cause of the energy expressed by the verb) is different from the *accusative* (or that noun upon which the energy expressed by the verb is exerted), these may be placed in any situation that the writer shall think proper, without occasioning the smallest confusion: whereas in the analogous languages, as these two different states of the noun are expressed by the same word, they cannot be distinguished but by their position alone: so that the noun which is the efficient cause must always precede the verb, and that which is the passive subject must follow; which greatly cramps the harmonious flow of composition.—Thus the Latins, without the smallest perplexity in the meaning, could say either *Brutum amat Cassius*, or *Cassius amat Brutum*, or *Brutum Cassius amat*, or *Cassius Brutum amat*. As the termination of the word *Cassius* always points out that it is in the *nominative case*, and therefore that he is the person from whom the energy proceeds; and in the same manner, as the termination of the word *Brutum* points out that it is in the *accusative case*, and consequently that he is the object upon whom the energy is exerted; the meaning continues still distinct and clear, notwithstanding all these several variations: whereas in the English language, we could only say *Cassius loved Brutus*, or, by a more forced phraseology, *Cassius Brutus loved*: Were we to reverse the case, as in the Latin, the meaning also would be reversed; for if we say *Brutus loved Cassius*, it is evident, that, instead of being the person beloved, as before, *Brutus* now becomes the person from whom the energy proceeds, and *Cassius* becomes the object beloved.—In this respect, therefore, the analogous languages are greatly inferior to the transpositive; and indeed it is from this single circumstance alone that they derive their chief excellence.

But although it thus appears evident, that any language, which has a particular variation of its nouns to distinguish the *accusative* from the *nominative case*, has an advantage over those languages which have none; yet it does not appear that any other of their *cases* adds to the variety, but rather the reverse: for, in Latin, we can only say *Amor Dei*; in English the same phrase may be rendered, either,—*the love of God—of God the love*,—or, by a more forced arrangement, *God the love of*. And as these oblique cases, as the Latins called them, except the accusative, are clearly distinguished from one another, and from the nominative, by the preposition which accompanies them, we are not confined to any particular arrangement with regard to these as with the accusative, but may place them in what order we please, as in Milton's elegant invocation at the beginning of Paradise Lost:

Of man's first disobedience, and the fruit  
Of that forbidden tree, whose mortal taste  
Brought death into the world, and all our wo,  
With loss of Eden, till one greater man  
Restore us, and regain the blissful seat,  
Sing, heavenly Muse.

In this sentence the transposition is almost as great as the

ment o  
words i  
sentenc  
but

the Latin language would admit of, and the meaning as distinct as if Milton had begun with the plain language of prose, thus,—"Heavenly muse, sing of man's first disobedience," &c.

Before we leave this head, we may remark, that the little attention which seems to have been paid to this peculiar advantage derived from the use of an accusative case different from the nominative, is somewhat surprising. The Latins, who had more occasion to attend to this with care than any other nation, and even the Greeks themselves, have in many cases overlooked it, as is evident from the various instances we meet with in their languages where this is not distinguished. For all nouns of the neuter gender both in Greek and Latin have in every declension their nominative and accusative singular alike. Nor in the plural of such nouns is there any distinction between these two cases; and in Latin all nouns whatever of the third, fourth, and fifth declensions, of which the number is very considerable, have their nominative and accusative plural alike. So that their language reaps no advantage in this respect from almost one half of their nouns. Nor have any of the modern languages in Europe, however much they may have borrowed from the ancient languages in other respects, attempted to copy from them in this particular; from which perhaps more advantage would have been gained, than from copying all the other supposed excellencies of their language.—But to return to our subject.

It remains that we consider, whether the inflection of nouns gives any advantage over the method of defining them by prepositions, in point of distinctness and precision of meaning? But in this respect, too, the analogous languages must come off victorious. Indeed this is the particular in which their greatest excellence consists, nor was it, we believe, ever disputed, but that, in point of accuracy and precision, this method must excel all others, however it may be defective in other respects. We observed under this head, when speaking of verbs, that it might perhaps be possible to form a language by inflection which should be capable of as great accuracy as in the more simple order of auxiliaries: but this would have been such an infinite labour, that it was not to be expected that ever human powers would have been able to accomplish it. More easy would it have been to have formed the several inflections of the nouns so different from one another, as to have rendered it impossible ever to mistake the meaning. Yet even this has not been attempted. And as we find that those languages which have adopted the method of inflecting their verbs are more imperfect in point of precision than the other, so the same may be said of inflecting the nouns: for, not to mention the energy which the analogous languages acquire by putting the accent upon the noun, or its preposition (when in an oblique case), according as the subject may require, to express which variation of meaning no particular variety of words have been invented in any inflected language, they are not even complete in other respects. The Latin, in particular, is in many cases defective, the same termination being employed in many instances for different cases of the same noun. Thus the genitive and dative singular, and nominative and vocative plural, of the first declension, are all exactly alike, and can only be distinguished from one another by the formation

of the sentences;—as are also the nominative, vocative, and ablative singular, and the dative and ablative plural. In the second, the genitive singular, and nominative and vocative plural, are the same; as are also the dative and ablative singular, and dative and ablative plural; except those in *um*, whose nominative, accusative, and vocative singular, and nominative, accusative, and vocative plural, are alike. The other three declensions agree in many of their cases as these do; which evidently tends to perplex the meaning, unless the hearer is particularly attentive to, and well acquainted with, the particular construction of the other parts of the sentence; all of which is totally removed, and the clearest certainty exhibited at once, by the help of prepositions in the analogous languages.

It will hardly be necessary to enter into such a minute examination of the advantages or disadvantages attending the variation of *adjectives*; as it will appear evident, from what has been already said, that the endowing them with terminations familiar to, and corresponding with, *substantives*, must tend still more to increase the similarity of sounds in any language, than any of those particulars we have already taken notice of; and were it not for the liberty which they have, in transpositive languages, of separating the adjective from the substantive, this must have occasioned such a jingle of similar sounds as could not fail to have been most disgusting to the ear: but as it would have been impossible in many cases, in those languages where the verbs and nouns are inflected, to have pronounced the words which ought to have followed each other, unless their adjectives could have been separated from the substantives; therefore, to remedy this inconvenience, they were forced to devise this unnatural method of inflecting them also; by which means it is easy to recognise to what substantive any adjective has a reference, in whatever part of the sentence it may be placed. In these languages, therefore, this inflection, both as to gender, number, and case, becomes absolutely necessary; and, by the diversity which it admitted in the arranging the words of the several phrases, might counterbalance the jingle of similar sounds which it introduced into the language.

Having thus examined the most striking particulars in which the transpositive and analogous languages differ, and endeavoured to show the general tendency of every one of the particulars separately, it would not be fair to dismiss the subject without considering each of these as a whole, and pointing out their general tendency in that light: for we all know, that it often happens in human inventions, that every part which composes a whole, taken separately, may appear extremely fine; and yet, when all these parts are put together, they may not agree, but produce a jarring and confusion very different from what we might have expected. We therefore imagine a few remarks upon the genius of each of these two distinct idioms of language considered as a whole will not be deemed useless.

Although all languages agree in this respect, that they are the means of conveying the ideas of one man to another; yet as there is an infinite variety of ways in which we might wish to convey these ideas, some times by the easy and familiar mode of conversation, and at other times by more solemn addresses to the

These two different idioms of language compared as to their general effects.

25  
The transpositive idiom fitted for solemn compositions.

Language. understanding, by pompous declamation, &c. it may so happen, that the genius of one language may be more properly adapted to the one of these than the other, while another language may excel in the opposite particular. This is exactly the case in the two general *IDIOMS* of which we now treat. Every particular in a *transpositive* language, is peculiarly calculated for that solemn dignity which is necessary for pompous orations. Long sounding words, formed by the inflection of the different parts of speech, -flowing periods, in which the attention is kept awake by the harmony of the sounds, and in expectation of that word which is to unravel the whole, -if composed by a skilful artist, are admirably suited to that solemn dignity and awful grace which constitute the essence of a public harangue. On the contrary, in private conversation, where the mind wishes to unbend itself with ease, these become so many clogs which encumber and perplex. At these moments we wish to transfuse our thoughts with ease and facility—we are tired with every unnecessary syllable—and wish to be freed from the trouble of attention as much as may be. Like our state-robcs, we would wish to lay aside our pompous language, and enjoy ourselves at home with freedom and ease. Here the solemnity and windings of the *transpositive* language are burdensome; while the facility with which a sentiment can be expressed in the *analogous* language is the thing that we wish to acquire. Accordingly in Terence and Plautus, where the beauties of dialogue are most charmingly displayed, transposition is sparingly used. In this humble, though most engaging sphere, the analogous language moves unrivalled;—in this it wishes to indulge, and never tires. But it in vain attempts to rival the *transpositive* in dignity and pomp: The number of monosyllables interrupt the flow of harmony; and although they may give a greater variety of sounds, yet they do not naturally possess that dignified gravity which suits the other language. This, then, must be considered as the striking particular in the genius of these two different *IDIOMS*, which marks their characters.

If we consider the effects which these two different characters of language must naturally produce upon the people who employ them, we will soon perceive, that the genius of the *analogous* language is much more favourable for the most engaging purposes of life, the civilizing the human mind by mutual intercourse of thought, *than the transpositive*. For as it is chiefly by the use of speech that man is raised above the brute creation;—as it is by this means he improves every faculty of his mind, and, to the observations which he may himself have made, has the additional advantage of the experience of those with whom he may converse, as well as the knowledge which the human race have acquired by the accumulated experience of all preceding ages;—as it is by the enlivening glow of conversation that kindred souls catch fire from one another, that thought produces thought, and each improves upon the other, till they soar beyond the bounds which human reason, if left alone, could ever have aspired to;—we must surely consider that language as the most beneficial to society, which most effectually removes these bars that obstruct its progress. Now, the genius of the *analogous* languages is so easy, so simple and plain, as to be within the reach of every one who is born in the kingdom where it is used

to speak it with facility; even the rudest among the vulgar can hardly fall into any considerable grammatical errors: whereas, in the *transpositive* languages, so many rules are necessary to be attended to, and so much variation is produced in the meaning, by the slightest variations in the sound, that it requires a study far above the reach of the illiterate mechanic ever to attain. So that, how perfect soever the language may be when spoken with purity, the bulk of the nation must ever labour under the inconvenience of rudeness and inaccuracy of speech, and all the evils which this naturally produces.—Accordingly, we find, that in Rome, a man, even in the highest rank, received as much honour, and was as much distinguished among his equals, for being able to converse with ease, as a modern author would be for writing in an easy and elegant style; and Cæsar among his contemporaries was as much esteemed for his superiority in speaking the language in ordinary conversation with ease and elegance, as for his powers of oratory, his skill in arms, or his excellence in literary composition. It is needless to point out the many inconveniences which this must unavoidably produce in a state. It is sufficient to observe, that it naturally tends to introduce a vast distinction between the different orders of men; to set an impenetrable barrier between those born in a high and those born in a low station; to keep the latter in ignorance and barbarity, while it elevates the former to such a height as must subject the other to be easily led by every popular demagogue.—How far the history of the nations who have followed this *IDIOM* of language confirms this observation, every one is left to judge for himself.

Having thus considered *LANGUAGE* in general, and pointed out the genius and tendency of the two most distinguished *IDIOMS* which have prevailed; we shall close these remarks with a few observations upon the particular nature and genius of those languages which are now chiefly spoken or studied in Europe.

Of all the nations whose memory history has transmitted to us, none have been so eminently distinguished for their literary accomplishments, as well as acquaintance with the polite arts, as the Greeks; nor are we as yet acquainted with a language possessed of so many advantages, with so few defects, as that which they used, and which continues still to be known by their name.—The necessary connection between the progress of knowledge and the improvement of language has been already explained; so that it will not be surprising to find their progress in the one keep pace with that of the other: but it will be of utility to point out some advantages which that distinguished people possessed, which other nations, perhaps not less distinguished for talents or taste, have not enjoyed, which have contributed to render their language the most universally admired in ancient as well as in modern times.

It has been already observed, that the original inhabitants of Greece, who were gross savages, and whose language of course would be very rude and narrow, were first tamed by the Pelasgi, an eastern or an Egyptian tribe. From the east it is well known that arts and sciences were spread over the rest of the world, and that Egypt was one of the countries first civilized. The language therefore imported into Greece by the Pelasgi would be pure from the fountain head, and much

26  
The analogous for private conversation and written dialogue.

Observations those which now spoken studied in Europe.

The superior of the Greek language is the cause of its being so much admired.

more perfect in its structure than if it had been transmitted through many nations. But this was not the only circumstance highly fortunate for the Greek language. Before it had time to be fully established among the people, its asperities which it had in common with the other dialects of the east, were polished away by such a succession of poets, musicians, philosophers, and legislators, from different countries, as never appeared in any other nation at a period so early as to give their genius and taste its full influence. In this respect, no people were ever so eminently distinguished as the ancient Greeks, who had their Orpheus, their Linus, their Cecrops, and their Cadmus, who introduced their different improvements at a time when the nation had no standard of taste formed by itself. Hence the original sounds of the Greek language are the most harmonious, and the most agreeable to the ear, of any that have hitherto been invented. They are indeed agreeable to every person who hears them, even when the meaning of the words is not understood; whereas almost all other languages, till they are understood, appear, to an ear which has not been accustomed to them, jarring and discordant. This is the fundamental excellence of that justly admired language; nor have the people failed to improve this to the utmost of their power, by many aids of their own invention. The Greek language is of the *transpositive* kind: but a people so lively, so acute, and so loquacious, could ill bear the ceremonious restraint to which that mode of language naturally subjected them; and have therefore, by various methods, freed it in a great measure from the stiffness which that produced. In inflecting their nouns and verbs, they sometimes prefix a syllable, and sometimes add one; which, besides the variety that it gives to the sounds of the language, adds greatly to the distinctness, and admits of a more natural arrangement of the words than in the Latin, and of consequence renders it much fitter for the easiness of private conversation: and indeed the genius of the people so far prevailed over the *idion* of the language, as to render it, in the age of its greatest perfection, capable of almost as much ease, and requiring almost as little transposition of words, as those languages which have been called *analogous*. But as those nations who spoke this language were all governed by popular assemblies, and as no authority could be obtained among them but by a skill in rhetoric and the powers of persuasion; it became necessary for every one, who wished to acquire power or consideration in the state, to improve himself in the knowledge of that language, in the use of which alone he could expect honours or reputation. Hence it happened, that while the vivacity of the people rendered it easy, the great men studiously improved every excellence that it could reap from its powers as a *transpositive* language; so that, when brought to its utmost perfection by the amazing genius of the great Demosthenes, it attained a power altogether unknown to any other language.—Thus happily circumstanced, the Greek language arrived at that envied pre-eminence which it still justly retains. From the progress of arts and sciences; from the gaiety and inventive genius of the people; from the number of free states into which Greece was divided, each of which invented words of its own, all of which contributed to the general stock; and from the natural communica-

tion which took place between these states, which excited in the strongest degree the talents of the people; it acquired a copiousness unknown to any ancient language, and excelled by few of the moderns.—In point of harmony of numbers, it is altogether unrivalled; and on account of the ease as well as dignity which, from the causes above mentioned, it acquired, it admits of perfection in a greater number of particular kinds of composition than any other language known.—The irresistible force and overwhelming impetuosity of Demosthenes seems not more natural to the genius of the language, than the more flowery charms of Plato's calm and harmonious cadences, or the unadorned simplicity of Xenophon; nor does the majestic pomp of Homer seem to be more agreeable to the genius of the language in which he wrote, than the more humble strains of Theocritus, or the laughing festivity of Anacreon: Equally adapted to all purposes, when we peruse any of these authors, we would imagine the language was most happily adapted for his particular style alone. The same powers it likewise, in a great measure, possessed for conversation; and the dialogue seems not more natural for the dignity of Sophocles or Euripides, than for the more easy tenderness of Menander, or buffoonery of Aristophanes.—With all these advantages, however, it must be acknowledged, that it did not possess that unexceptionable clearness of meaning which some analogous languages enjoy, or that characteristic force which the emphasis properly varied has power to give, were not these defects counterbalanced by other causes which we shall afterwards point out.

The Romans, a people of fierce and warlike dispositions, for many ages during the infancy of their republic, more intent on pursuing conquests and military glory than in making improvements in literature or the fine arts, bellowed little attention to their language. Of a disposition less social or more phlegmatic than the Greeks, they gave themselves no trouble about rendering their language fit for conversation; and it remained strong and nervous, but, like their ideas, was limited and confined. More disposed to command respect by the power of their arms than by the force of persuasion, they despised the more effeminate powers of speech: so that, before the Punic wars, their language was perhaps more reserved and uncourtly than any other at that time known.—But after their rival Carthage was destroyed, and they had no longer that powerful curb upon their ambition; when riches flowed in upon them by the multiplicity of their conquests;—luxury began to prevail, the stern austerity of their manners to relax, and selfish ambition to take place of that disinterested love for their country so eminently conspicuous among all orders of men before that period.—Popularity began then to be courted: ambitious men, finding themselves not possessed of that merit which insured them success with the virtuous senate, amused the mob with artful and seditious harangues; and by making them believe that they were possessed of all power, and had their sacred rights encroached upon by the senate, led them about at their pleasure, and got themselves exalted to honours and riches by these insidious arts. It was then the Romans first began to perceive the use to which a command of language could be put. Ambitious men

29  
The Latin language inferior to the Greek; and why.

Language.

then studied it with care, to be able to accomplish their ends; while the more virtuous were obliged to acquire a skill in this, that they might be able to repel the attacks of their adversaries.—Thus it happened, that in a short time that people, from having entirely neglected, began to study their language with the greatest assiduity; and as Greece happened to be subjected to the Roman yoke about that time, and a friendly intercourse was established between these two countries, this greatly conspired to nourish in the minds of the Romans a taste for that art of which they had lately become so much enamoured. Greece had long before this period been corrupted by luxury; their taste for the fine arts had degenerated into unnecessary refinement; and all their patriotism consisted in popular harangues and unmeaning declamation. Oratory was then studied as a refined art; and all the subtleties of it were taught by rule, with as great care as the gladiators were afterwards trained up in Rome. But while they were thus idly trying who should be the lord of their own people, the nerves of government were relaxed, and they became an easy prey to every invading power. In this situation they became the *subjects*, under the title of the *allies*, of Rome, and introduced among them the same taste for haranguing which prevailed among themselves. Well acquainted as they were with the powers of their own language, they set themselves with unwearied assiduity to polish and improve that of their new masters: but with all their assiduity and pains, they never were able to make it arrive at that perfection which their own language had acquired; and in the Augustan age, when it had arrived at the summit of its glory, Cicero bitterly complains of its want of copiousness in many particulars.

30  
It could not be carried to the same degree of perfection.

But as it was the desire of all who studied this language with care, to make it capable of that stately dignity and pomp necessary for public harangues, they followed the genius of the language in this particular, and in a great measure neglected those lesser delicacies which form the pleasure of domestic enjoyment; so that, while it acquired more copiousness, more harmony, and precision, it remained stiff and inflexible for conversation: nor could the minute distinction of nice grammatical rules be ever brought down to the apprehension of the vulgar; whence the language spoken among the lower class of people remained rude and unpolished even to the end of the monarchy. The Huns who over-run Italy, incapable of acquiring any knowledge of such a difficult and abstruse language, never adopted it; and the native inhabitants being made acquainted with a language more natural and easily acquired, quickly adopted that idiom of speech introduced by their conquerors, although they still retained many of those words which the confined nature of the barbarian language made necessary to allow them to express their ideas.—And thus it was that the language of Rome, that proud mistress of the world, from an original defect in its formation, although it had been carried to a perfection in other respects far superior to any northern language at that time, easily gave way to them, and in a few ages the knowledge of it was lost among mankind: while, on the contrary, the more easy nature of the Greek language has still been able to keep some slight footing in the world, although the nations in which it has

been spoken have been subjected to the yoke of foreign reign dominion for upwards of two thousand years, and their country has been twice ravaged by barbarous nations, and more cruelly depressed than ever the Romans were.

From the view which we have already given of the Latin language, it appears evident, that its idiom was more strictly transpositive than that of any other language yet known, and was attended with all the defects to which that idiom is naturally subjected: nor could it boast of such favourable alleviating circumstances as the Greek, the prevailing sounds of the Latin being far less harmonious to the ear; and although the formation of the words are such as to admit of full and distinct sounds, and so modulated as to lay no restraint upon the voice of the speaker; yet, to a person unacquainted with the language, they do not convey that enchanting harmony so remarkable in the Greek language. The Latin is stately and solemn; it does not excite disgust; but at the same time it does not charm the ear, so as to make it listen with delightful attention. To one acquainted with the language indeed, the nervous boldness of the thoughts, the harmonious rounding of the periods, the full solemn swelling of the sounds, so distinguishable in the most eminent writers in that language which have been preserved to us, all conspire to make it pleasing and agreeable.—In these admired works we meet with all its beauties, without perceiving any of its defects; and we naturally admire, as perfect, a language which is capable of producing such excellent works.—Yet with all these seeming excellencies, this language is less copious, and more limited in its style of composition, than many modern languages; far less capable of precision and accuracy than almost any of these; and infinitely behind them all in point of easiness in conversation. But these points have been so fully proved already, as to require no further illustration.—Of the compositions in that language which have been preserved to us, the *Orations* of Cicero are best adapted to the genius of the language, and we there see it in its utmost perfection. In the *Philosophical Works* of that great author we perceive some of its defects; and it requires all the powers of that great man to render his *Epistles* agreeable, as these have the genius of the language to struggle with.—Next to oratory, history agrees with the genius of this language; and Cæsar, in his *Commentaries*, has exhibited the language in its purest elegance, without the aid of pomp or foreign ornament.—Among the poets, Virgil has best adapted his works to his language. The flowing harmony and pomp of it is well adapted for the epic strain, and the correct delicacy of his taste rendered him perfectly equal to the task. But Horace is the only poet whose force of genius was able to overcome the bars which the language threw in his way, and succeed in lyric poetry. Were it not for the brilliancy of the thoughts, and acuteness of the remarks, which so eminently distinguish this author's compositions, his odes would long ere now have sunk into utter oblivion. But so conscious have all the Roman poets been of the unfitness of their language for easy dialogue, that almost none of them, after Plautus and Terence, have attempted any dramatic compositions in that language. Nor have we any reason to regret that they neglected this

guage. branch of poetry, as it is probable, if they had ever become fond of these, they would have been obliged to have adopted for many unnatural contrivances to render them agreeable, as would have prevented us (who of course would have considered ourselves as bound to follow them) from making that progress in the drama which for particularly distinguishes the productions of modern times.

<sup>It</sup> <sup>Italian</sup> <sup>age of</sup> <sup>the</sup> <sup>idi-</sup> <sup>and</sup> The modern *Italian* language, from an inattention too common in literary subjects, has been usually called a *child of the Latin language*, and is commonly believed to be the ancient Latin a little debased by the mixture of the barbarous language of those people who conquered Italy. The truth is, the case is directly the reverse: for this language, in its general idiom and fundamental principles, is evidently of the analogous kind, first introduced by those fierce invaders, although it has borrowed many of its words, and some of its modes of phraseology, from the Latin, with which they were so intimately blended that this could scarcely be avoided; and it has been from remarking this slight connection so obvious at first sight, that superficial observers have been led to draw this general conclusion, so contrary to fact.

When Italy was over-run with the Lombards, and the empire destroyed by these northern invaders, they, as conquerors, continued to speak their own native language. Fierce and illiterate, they would not stoop to the fervility of studying a language so clogged with rules, and difficult of attainment, as the Latin would naturally be to a people altogether unacquainted with nice grammatical distinctions: while the Romans of necessity were obliged to study the language of their conquerors, as well to obtain some relief of their grievances by prayers and supplications, as to destroy that odious distinction which subsisted between the conquerors and conquered while they continued as distinct people. As the language of their new masters, although rude and confined, was natural in its order, and easy to be acquired, the Latins would soon attain a competent skill in it: and as they bore such a proportion to the whole number of people, the whole language would partake somewhat of the general sound of the former: for, in spite of all their efforts to the contrary, the organs of speech could not at once be made to acquire a perfect power of uttering any unaccustomed sounds; and as it behoved the language of the barbarians to be much less copious than the Latin, whenever they found themselves at a loss for a word, they would naturally adopt those which most readily presented themselves from their new subjects. Thus a language in time was formed, somewhat resembling the Latin both in the general tenor of the sounds and in the meaning of many words: and as the barbarians gave themselves little trouble about language, and in some cases perhaps hardly knew the general analogy of their own language, it is not surprising if their new subjects should find themselves sometimes at a loss on that account; or if, in these situations, they followed, on some occasions, the analogy suggested to them by their own: which accounts for the strange degree of mixture of heterogeneous grammatical analogy we meet with in the Italian as well as Spanish and French languages. The idiom of all the Gothic languages is purely analogous; and in all probability,

before their mixture with the Latins and other people <sup>Language.</sup> in their provinces, the several grammatical parts of speech followed the plain simple idea which that supposes; the verbs and nouns were all probably varied by auxiliaries, and their adjectives retained their simple unalterable state:—but by their mixture with the Latins, this simple form has been in many cases altered; their verbs became in some cases inflected; but their nouns in all these languages still retained their original form; although they have varied their adjectives, and foolishly clogged their nouns with gender, according to the Latin idioms. From this heterogeneous and fortuitous (as we may say, because injudicious) mixture of parts, results a language possessing almost all the defects of each of the languages of which it is composed, with few of the excellencies of either: for it has neither the ease and precision of the *analogous*, nor the pomp and boldness of the *transpositive*, languages; at the same time that it is clogged with almost as many rules, and liable to as great abuses.

These observations are equally applicable to the French and Spanish as to the Italian language. With regard to this last in particular, we may observe, that as the natural inhabitants of Italy, before the last invasion of the barbarians, were sunk and enervated by luxury, and that by depression of mind and genius which anarchy always produces, they had become fond of feasting and entertainments, and the enjoyment of sensual pleasures constituted their highest delight; and their language partook of the same debility as their body.—The barbarians too, unaccustomed to the seductions of pleasure, soon fell from their original boldness and intrepidity, and, like Hannibal's troops of old, were enervated by the sensual gratifications in which a nation of conquerors unaccustomed to the restraint of government freely indulged. The softness of the air, the fertility of the climate, the unaccustomed flow of riches which they at once acquired, together with the voluptuous manner of their conquered subjects; all conspired to enervate their minds, and render them soft and effeminate. No wonder then, if a language new-moulded at this juncture should partake of the genius of the people who formed it; and instead of participating of the martial boldness and ferocity of either of their ancestors, should be softened and enfeebled by every device which an effeminate people could invent.—The strong consonants which terminated the words, and gave them life and boldness, being thought too harsh for the delicate ears of these sons of sloth, were banished their language; while sonorous vowels, which could be protracted to any length in music, were substituted in their stead.—Thus the Italian language is formed flowing and harmonious, though but destitute of those nerves which constitute the strength and vigour of a language: at the same time, the sounds are neither enough diversified, nor in themselves of such an agreeable tone, as to afford great pleasure without the aid of musical notes; and the small pleasure which this affords is still lessened by the little variety of measure which the great similarity of the terminations of the words occasions. Hence it happens, that this language is fitted for excelling in fewer branches of literature than almost any other: and although we have excellent historians, and more than ordinary poets, in Italian, yet they labour under

Language. great inconveniences, from the language wanting nerves and stateliness for the former, and sufficient variety of modulation for the latter. It is, more particularly on this account, altogether unfit for an epic poem: and though attempts have been made in this way by two men whose genius, if not fettered by the language, might have been crowned with success; yet these, notwithstanding the fame that with some they may have acquired, must, in point of poetic harmony, be deemed defective by every impartial person. Nor is it possible that a language which hardly admits of poetry without rhyme, can ever be capable of producing a perfect poem of great length; and the stanza to which their poets have ever confined themselves, must always produce the most disagreeable effect in a poem where unrestrained pomp or pathos are necessary qualifications. The only species of poetry in which the Italian language can claim a superior excellence, is the tender tone of elegy: and here it remains unrivalled and alone; the plaintive melody of the sounds, and smooth flow of the language, being perfectly adapted to express that soothing melancholy which this species of poetry requires. On this account the plaintive scenes of the *Pastor Fido* of *Guarini* have justly gained to that poem an universal applause; although, unless on this account alone, it is perhaps inferior to almost every other poem of the kind which ever appeared.— We must observe with surprise, that the Italians, who have fettered every other species of poetry with the severest shackles of rhyme, have in this species showed an example of the most unrestrained freedom; the happy effects of which ought to have taught all Europe the powerful charms attending it: yet with amazement we perceive, that scarce an attempt to imitate them has been made by any poet in Europe except by Milton in his *Lycidas*; no dramatic poet, even in Britain, having ever adopted the unrestrained harmony of numbers to be met with in this and many other of their best dramatic compositions.

35  
The excellency of the Spanish tongue.

Of all the languages which sprung up from the mixture of the Latins with the northern people on the destruction of the Roman empire, none of them approach so near to the genius of the Latin as the Spanish does. For as the Spaniards have been always remarkable for their military prowess and dignity of mind, their language is naturally adapted to express ideas of that kind. Sonorous and solemn, it admits nearly of as much dignity as the Latin. For conversation, it is the most elegant and courteous language in Europe.

The humane and generous order of chivalry was first invented, and kept its footing longest, in this nation; and although it run at last into such a ridiculous excess as deservedly made it fall into universal disrepute, yet it left such a strong tincture of romantic heroism upon the minds of all ranks of people, as made them jealous of their glory, and strongly emulous of cultivating that heroic politeness, which they considered as the highest perfection they could attain. Every man disdained to flatter, or to yield up any point of honour which he possessed; at the same time, he rigorously exacted from others all that was his due. These circumstances have given rise to a great many terms of respect, and courteous condescension, without meanness or flattery, which give their dialogue a respectful politeness and elegance unknown to any other

European language. This is the reason why the characters so finely drawn by Cervantes in *Don Quixotte* are still unknown to all but those who understand the language in which he wrote. Nothing can be more unlike the gentle meekness and humane heroism of the knight, or the native simplicity, warmth of affection, and respectful loquacity of the squire, than the inconsistent follies of the one, or the impertinent forwardness and disrespectful petulance of the other, as they are exhibited in every English translation. Nor is it, as we imagine, possible to represent so much familiarity, united with such becoming condescension in the one, and unfeigned deference in the other, in any other European language, as is necessary to paint these two admirable characters.

Although this language, from the solemn dignity and majestic elegance of its structure, is perhaps better qualified than any other modern one for the sublime strains of epic poetry; yet as the poets of this nation have all along imitated the Italians by a most servile subjection to rhyme, they never have produced one poem of this sort, which in point of poetry of style deserves to be transmitted to posterity. And in any other species of poetry but this, or the higher tragedy, it is not naturally fitted to excel. But although the drama and other polite branches of literature were early cultivated in this country, and made considerable progress in it, before the thirst of gain debased their souls, or the desire of universal dominion made them forfeit that liberty which they once so much prized; since they became enervated by an overbearing pride, and their minds enslaved by superstition, all the polite arts have been neglected: so that, while other European nations have been advancing in knowledge, and improving their language, they have remained in a state of torpid inactivity; and their language has not arrived at that perfection which its nature would admit, or the acute genius of the people might have made us naturally expect.

It will perhaps by some be thought an unpardonable insult, if we do not allow the French the preference of all modern languages in many respects. But so far must we pay a deference to truth, as to be obliged to rank it among the poorest languages in Europe. Every other language has some sounds which can be uttered clearly by the voice: even the Italian, although it wants energy, still possesses distinctness of articulation. But the French is almost incapable of either of these beauties; for in that language the vowels are so much curtailed in the pronunciation, and the words run into one another in such a manner, as necessarily to produce an indistinctness which renders it incapable of measure or harmony. From this cause, it is in a great measure incapable of poetic modulation, and rhyme has been obliged to be substituted in its stead; so that this poorest of all contrivances which has ever yet been invented to distinguish poetry from prose, admitted into all the modern languages when ignorance prevailed over Europe, has still kept some footing in the greatest part of these, rather through a deference for established customs than from any necessity. Yet as the French language admits of so little poetic modulation, rhyme is in some measure necessary to it; and therefore this poor deviation from prose has been adopted by it, and dignified with the name of *Poetry*.

36  
The French language deficient in dignity and energy.

try. But by their blind attachment to this artifice, the French have neglected to improve so much as they might have done the small powers for harmony of which their language is possessed; and by being long accustomed to this false taste, they have become fond of it to such a ridiculous excess, as to have all their tragedies, nay even their comedies, in rhyme. While the poet is obliged to enervate his language, and check the flow of composition, for the sake of linking his lines together, the judicious actor finds more difficulty in destroying the appearance of that measure, and preventing the clinking of the rhimes, than in all the rest of his task.—After this, we will not be surpris'd to find Voltaire attempt an epic poem in this species of poetry; although the more judicious Fenelon in his *Telemaque* had shown to his countrymen the only species of poetry that their language could admit of for any poem which aspired to the dignity of the epic strain.—Madam Deshouliers, in her *Idyllie*, has shown the utmost extent of harmony to which their language can attain in smaller poems: indeed in the tenderness of an elegy, or the gaiety of a song, it may succeed; but it is so destitute of force and energy, that it can never be able to reach the pindaric, or even perhaps the lyric strain,—as the ineffectual efforts even of the harmonious Rousseau, in his translation of the Psalms of David of this stamp, may fully convince us.

With regard to its powers in other species of composition, the sententious rapidity of Voltaire, and the more nervous dignity of Rousseau, afford us no small presumption, that, in a skilful hand, it might acquire so much force, as to transmit to futurity historical facts in a style not altogether unworthy of the subject. In attempts at pathetic declamation, the superior abilities of the composer may perhaps on some occasions excite a great idea; but this is ever cramped by the genius of the language: and although no nation in Europe can boast of so many orations where this grandeur is attempted; yet perhaps there are few who cannot produce more perfect, although not more laboured, compositions of this kind.

But notwithstanding the French language labours under all these inconveniences; although it can neither equal the dignity or genuine politeness of the Spanish, the nervous boldness of the English, nor the melting softness of the Italian; although it is desti-

tute of poetic harmony, and so much cramped in sound as to be absolutely unfit for almost every species of musical composition (F); yet the sprightly genius of that volatile people has been able to surmount all these difficulties, and render it the language most generally esteemed, and most universally spoken, of any in Europe; for this people, naturally gay and loquacious, and fond to excess of those superficial accomplishments which engage the attention of the fair sex, have invented such an infinity of words capable of expressing vague and unmeaning compliment, now dignified by the name of *politenss*, that, in this strain, one who uses the French can never be at a loss; and as it is easy to converse *more*, and really say *less*, in this than in any other language, a man of very moderate talents may distinguish himself much more by using this than any other that has ever yet been invented. On this account, it is peculiarly well adapted to that species of conversation which must ever take place in those general and promiscuous companies, where many persons of both sexes are met together for the purposes of relaxation or amusement; and must of course be naturally admitted into the courts of princes, and assemblies of great personages; who, having fewer equals with whom they can associate, are more under a necessity of conversing with strangers, in whose company the tender stimulus of friendship does not so naturally expand the heart to mutual trust or unrestrained confidence. In these circumstances, as the heart remaineth disengaged, conversation must necessarily flag; and mankind in this situation will gladly adopt that language in which they can converse most easily without being deeply interested. On these accounts the French now is, and probably will continue to be, reckoned the most polite language in Europe, and therefore the most generally studied and known: nor should we envy them this distinction, if our countrymen would not weaken and enervate their own manly language, by adopting too many of their unmeaning phrases.

The English is perhaps possessed of a greater degree of excellence, blended with a greater number of defects, than any of the languages we have hitherto mentioned. As the people of Great Britain are a bold, daring, and impetuous race of men, subject to strong passions, and, from the absolute freedom and independence which reigns amongst all ranks of people

(F) An author of great discernment, and well acquainted with the French language, has lately made the same remark; and as the loftiness of his genius often prevents him from bringing down his illustrations to the level of ordinary comprehension, he has on this and many other occasions been unjustly accused of being fond of paradoxes.—But as music never produces its full effect but when the tones it assumes are in unison with the idea that the words naturally excite, it of necessity follows, that if the words of any language do not admit of that fulness of sound, or that species of tones, which the passion or affection that may be described by the words would naturally require to excite the same idea in the mind of one who was unacquainted with the language, it will be impossible for the music to produce its full effect, as it will be cramped and confined by the sound of the words;—and as the French language does not admit of those full and open sounds which are necessary for pathetic expression in music, it must of course be unfit for musical composition.—It is true indeed, that in modern times, in which so little attention is bestowed on the simple and sublime charms of pathetic expression, and a fantastical tingling of unmeaning sounds is called *music*—where the sense of the words are lost in fugues, quavers, and unnecessary repetition of particular syllables,—all languages are nearly fitted for it; and among these the French: nor is it less to be doubted, that, in the easy gaiety of a song, this language can properly enough admit of all the musical expression which that species of composition may require.

Language.

37 Admirably fitted for light conversation.

38 The excellencies and defects of the English tongue.

Language

throughout this happy isle, little solicitous about controlling these passions;—our language takes its strongest characteristical distinction from the genius of the people; and, being bold, daring, and abrupt, is admirably well adapted to express those great emotions which spring up in an intrepid mind at the prospect of interesting events. Peculiarly happy too in the full and open sound of the vowels, which forms the characteristic *tone* of the language, and in the strong use of the aspirate H in almost all those words which are used as exclamations, or marks of strong emotions upon interesting occasions, that particular class of words called *interjections* have, in our language, more of that fulness and unrestrained freedom of tones, in which their chief power consists, and are pushed forth from the inmost recesses of the soul in a more forcible and unrestrained manner, than any other language whatever. Hence it is more peculiarly adapted for the great and interesting scenes of the *drama* than any language that has yet appeared on the globe. Nor has any other nation ever arrived at that perfection which the English may justly claim in that respect; for however faulty our dramatic compositions may be in some of the critical niceties which relate to this art,—in nervous force of diction, and in the natural expression of those great emotions which constitute its soul and energy, we claim, without dispute, an unrivalled superiority. Our language too, from the great intercourse that we have had with almost all the nations of the globe by means of our extensive commerce, and from the eminent degree of perfection which we have attained in all the arts and sciences, has acquired a copiousness beyond what any other modern language can lay claim to: and even the most partial favourers of the Greek language are forced to acknowledge, that in this respect it must give place to the English. Nor is it less happy in that facility of construction which renders it more peculiarly adapted to the genius of a free people, than any other form of language. Of an *idiom* purely analogous, it has deviated less from the genius of that *idiom*, and possesses more of the characteristic advantages attending it than any other language that now exists: for, while *others*, perhaps by their more intimate connection with the Romans, have adopted some of their transpositions, and clogged their language with unnecessary fetters, *we* have preserved ourselves free from the contagion, and still retain the primitive simplicity of our language. Our *verbs* are all varied by auxiliaries (except in the instance we have already given, which is so much in our favour); our *nouns* remain free from the perplexing embarrassment of *genders*, and our pronouns mark this distinction where necessary with the most perfect accuracy; our *articles* also are of course freed from this unnatural encumbrance, and our *adjectives* preserve their natural freedom and independence. From these causes, our language follows an order of construction so natural and easy, and the rules of *syntax* are so few and obvious, as to be within the reach of the most ordinary capacity. So that from this, and the great clearness and distinctness of meaning with which this mode of construction is necessarily accompanied, it is much better adapted for the familiar intercourse of private society, and liable to fewer errors in using it,

Lang

than any other language yet known; and on this account we may boast, that in no nation of Europe do the lower class of people speak their language with so much accuracy, or have their minds so much enlightened by knowledge, as in Great Britain.—What then shall we say of the discernment of those grammarians, who are every day echoing back to one another complaints of the poverty of our language on account of the few and simple rules which it requires in syntax? As justly might we complain of an invention in mechanics, which, by means of one or two simple movements, obvious to an ordinary capacity, little liable to accidents, and easily put in order by the rudest hand, should possess the whole powers of a complex machine, which had required an infinite apparatus of wheels and contrary movements, the knowledge of which could only be acquired, or the various accidents to which it was exposed by using it be repaired, by the powers of an ingenious artist, as complain of this characteristic excellence of our language as a defect.

But if we thus enjoy in an eminent degree the advantages attending an *analogous* language, we likewise feel in a considerable measure the defects to which it is exposed; as the number of monosyllables with which it always must be embarrassed, notwithstanding the great improvements which have been made in our language since the revival of letters in Europe, prevents in some degree that swelling fulness of sound which so powerfully contributes to harmonious dignity and graceful cadences in literary compositions. And as the genius of the people of Britain has always been more disposed to the rougher arts of command than to the softer insinuations of persuasion, no pains have been taken to correct these natural defects of our language; but, on the contrary, by an inattention of which we have hardly a parallel in the history of any civilized nation, we meet with many instances, even within this last century, of the harmony of sound being sacrificed to that brevity so desirable in conversation, as many elegant words have been curtailed, and harmonious syllables suppressed, to substitute in their stead others, shorter indeed, but more barbarous and uncouth. Nay, so little attention have our forefathers bestowed upon the harmony of sounds in our language, that one would be tempted to think, on looking back to its primitive state, that they had on some occasions studiously debased it. Our language, at its first formation, seems to have laboured under a capital defect in point of sound, as such a number of S's enter into the formation of our words, and such a number of letters and combinations of other letters assume a similar sound, as to give a general hiss through the whole tenor of our language, which must be exceedingly disagreeable to every unprejudiced ear. We would therefore have naturally expected, that at the revival of letters, when our forefathers became acquainted with the harmonious languages of Greece and Rome, they would have acquired a more correct taste, and endeavoured, if possible, to diminish the prevalence of this disgusting sound. But so far have they been from thinking of this, that they have multiplied this letter exceedingly. The plurals of almost all our nouns were originally formed by adding the harmonious syllable *en* to the singular

guage. singular, which has given place to the letter *s*; and instead of *houfen* formerly, we now say *houses*. In like manner, many of the variations of our verbs were formed by the syllable *eb*, which we have likewise changed into the same disagreeable letter; so that, instead of *loveth, moveth, writeth, walketh, &c.* we have changed them into the more modish form of *loves, moves, writes, walks, &c.* Our very auxiliary verbs have suffered the same change; and instead of *hath and doth*, we now make use of *has and does*. From these causes, notwithstanding the great improvements which have been made in language, within these few centuries, in other respects; yet, with regard to the pleasingness of sound alone, it was perhaps much more perfect in the days of Chaucer than at present: and although custom may have rendered these sounds so familiar to our ear, as not to affect us much; yet to an unprejudiced person, unacquainted with our language, we have not the smallest doubt but the language of *Bacon* or *Sidney* would appear more harmonious than that of *Robertson* or *Hume*. This is indeed the fundamental defect of our language, and loudly calls for reformation.

But notwithstanding this great and radical defect with regard to pleasingness of sounds, which must be so strongly perceived by every one who is unacquainted with the meaning of our words; yet to those who understand the language, the exceeding copiousness which it allows in the choice of words proper for the occasion, and the nervous force which the perspicuity and graceful elegance the emphasis bestows upon it, makes this defect be totally overlooked; and we could produce such numerous works of prose, which excel in almost every different style of composition, as would be tiresome to enumerate: every reader of taste and discernment will be able to recollect a sufficient number of writings which excel in point of style, between the graceful and becoming gravity so conspicuous in all the works of the author of the *Whole Duty of Man*, and the animated and nervous diction of *Robertson* in his *History of Charles the Fifth*,—the more flowery style of *Shaftesbury*, or the Attic simplicity and elegance of *Addison*. But although we can equal, if not surpass, every modern language in works of prose, it is in its poetical powers that our language shines forth with the greatest lustre. The brevity to which we must here necessarily confine ourselves, prevents us from entering into a minute examination of the poetical powers of our own, compared with other languages; otherwise it would be easy to show, that every other modern language labours under great restraints in this respect which ours is freed from;—that our language admits of a greater variety of poetic movements, and diversity of cadence, than any of the admired languages of antiquity; that it distinguishes with the greatest accuracy between accent and quantity, and is possessed of every other poetic excellence which their languages were capable of: so that we are possessed of all the sources of harmony which they could boast; and, besides all these, have one super-added, which is the cause of greater variety and more forcible expression in numbers than all the rest; that is, the unlimited power given by the emphasis over quantity and cadence; by means whereof, a necessary union between sound and sense, numbers and meaning,

in versification, unknown to the ancients, has been brought about, which gives our language in this respect a superiority over all those justly admired languages. But as we cannot here further pursue this subject, we shall only observe, that these great and distinguishing excellencies far more than counterbalance the inconveniences that we have already mentioned: and although, in mere pleasantness of sounds, or harmonious flow of syllables, our language may be inferior to the Greek, the Latin, Italian, and Spanish; yet in point of manly dignity, graceful variety, intuitive distinctness, nervous energy of expression, unconfined freedom and harmony of poetic numbers, it will yield the palm to none. Our immortal *Milton*, slowly rising, in graceful majesty stands up as equal, if not superior in these respects to any poet, in any other language, that ever yet existed;—while *Thomson*, with more humble aim, in melody more smooth and flowing, softens the soul to harmony and peace:—the plaintive moan of *Hammond* calls forth the tender tear and sympathetic sigh; while *Gray's* more soothing melancholy fixes the sober mind to silent contemplation:—more tender still than these, the amiable *Shenston* comes; and from his *Doric* reed, still free from courtly affectation, flows a strain so pure, so simple, and of such tender harmony, as even Arcadian shepherds would be proud to own. But far before the rest, the daring *Shakespeare* steps forth conspicuous, clothed in native dignity; and, pressing forward with unremitting ardour, boldly lays claim to both dramatic crowns held out to him by *Thalia* and *Melpomene*:—his rivals, far behind, look up, and envy him for these unfading glories; and the astonished nations round, with distant awe, behold and tremble at his daring sight.—Thus the language, equally obedient to all, bends with ease under their hands, whatever form they would have it assume; and, like the yielding wax, readily receives, and faithfully transmits to posterity, those impressions which they have stamped upon it.

Such are the principal outlines of the language of Great Britain, such are its beauties, and such its most capital defects; a language more peculiarly circumstanced than any that has ever yet appeared.—It is the language of a great and powerful nation, whose fleets surround the globe, and whose merchants are in every port; a people admired or revered by all the world:—and yet it is less known in every foreign country than many of the other languages in Europe. In it are written more perfect treatises on every art and science than are to be found in any other language;—yet it is less sought after or esteemed by the literati in any part of the globe than almost any of these. Its superior powers for every purpose of language are sufficiently obvious from the models of perfection in almost every particular which can be produced in it:—yet it is neglected, despised, and vilified by the people who use it; and many of these authors who owe almost the whole of their fame to the excellence of the language in which they wrote, look upon that very language with the highest contempt. Neglected and despised, it has been trodden under foot as a thing altogether unworthy of cultivation or attention. Yet in spite of all these inconveniences, in spite of the many wounds it has thus received, it still holds up its

Language.

head, and preserves evident marks of that comeliness and vigour which are its characteristical distinction. Like a healthy oak planted in a rich and fertile soil, it has sprung up with vigour: and although neglected, and suffered to be over-run with weeds; although exposed to every blast, and unprotected from every violence; it still beareth up under all these inconveniences, and shoots up with a robust healthiness and wild luxuriance of growth. Should this plant, so found and vigorous, be now cleared from those weeds with which it has been so much encumbered;—should every obstacle which now buries it under thick shades, and hides it from the view of every passenger, be cleared away;—should the soil be cultivated with care, and a strong fence be placed around it, to prevent the idle or the wicked from breaking or distorting its branches;—who can tell with what additional vigour it would flourish, or what amazing magnitude and perfection it might at last attain!—How would the astonished world behold, with reverential awe, the majestic gracefulness of that object which they so lately despised!

*Beauty of LANGUAGE considered in regard to Composition.* The beauties of language may be divided into three classes: 1. Those which arise from sound; 2. Those which respect significance; 3. Those derived from a resemblance between sound and signification.

Elements of Crit.

I. *With respect to sound.* In a cursory view, one would imagine, that the agreeableness or disagreeableness of a word with respect to sound, should depend upon the agreeableness or disagreeableness of its component syllables: which is true in part, but not entirely; for we must also take under consideration the effect of syllables in succession. In the first place, syllables in immediate succession, pronounced each of them with the same, or nearly the same, aperture of the mouth, produce a succession of weak and feeble sounds; witness the French words *dit-il, pathétique*: on the other hand, a syllable of the greatest aperture succeeding one of the smallest, or the contrary, makes a succession which, because of its remarkable disagreeableness, is distinguished by a proper name, viz. *hiatus*. The most agreeable succession is, where the cavity is increased and diminished alternately, within moderate limits: examples, *Alternative, longevity, pusillanimous*. Secondly, words consisting wholly of syllables pronounced slow, or of syllables pronounced quick, commonly called *long and short syllables*, have little melody in them; witness the words *petitioner, fruiterer, dissimilis*: on the other hand, the intermixture of long and short syllables is remarkably agreeable; for example, *degree, repent, wonderful, altitude, rapidity, independent, impetuosity*; the cause of which is explained in POETRY, Part II.

To proceed to the music of periods. As the arrangement of words in succession, so as to afford the greatest pleasure to the ear, depends on principles remote from common view, it will be necessary to premise some general observations upon the appearance that objects make when placed in an increasing or decreasing series; which appearance will vary according to the prevalence of resemblance or of contrast. Where the objects vary by small differences so as to have a mutual resemblance, we in ascending conceive the second object of no greater size than the first, the third of no greater size than the second, and so of the rest;

which diminisheth in appearance the size of every object except the first: but when beginning at the greatest object, we proceed gradually to the least, resemblance makes us imagine the second as great as the first, and the third as great as the second; which in appearance magnifies every object except the first. On the other hand, in a series varying by large differences, where contrast prevails, the effects are directly opposite: a great object succeeding a small one of the same kind, appears greater than usual; and a little object succeeding one that is great, appears less than usual. † See R. Hence a remarkable pleasure in viewing a series ascending by large differences; directly opposite to what we feel when the differences are small. The least object of a series ascending by large differences has the same effect upon the mind as if it stood single without making a part of the series: but the second object, by means of contrast, appears greater than when viewed singly and apart; and the effect is perceived in ascending progressively, till we arrive at the last object. The opposite effect is produced in descending; for in this direction, every object, except the first, appears less than when viewed separately and independent of the series. We may then assume as a maxim, which will hold in the composition of language as well as of other subjects, That a strong impulse succeeding a weak, makes a double impression on the mind; and that a weak impulse succeeding a strong, makes scarce any impression.

After establishing this maxim, we can be at no loss about its application to the subject in hand. The following rule is laid down by Diomedes †. “In verbis observandum est, ne a majoribus ad minorā descendat oratio; melius enim dicitur, *Vir est optimus, quam Vir optimus est.*” This rule is also applicable to entire members of a period, which, according to our author’s expression, ought not, more than single words, to proceed from the greater to the less, but from the less to the greater. In arranging the members of a period, no writer equals Cicero: The following examples are too beautiful to be slurred over by a reference.

Quicum quaestor fueram,  
Quicum me fors consuetudoque majorum,  
Quicum me decorum hominumque iudicium conjunxerat.

Again:

Habet honorem quem petimus,  
Habet spem quam praepositam nobis habemus,  
Habet existimationem, multo sudore, labore, vigiliisque, collectam.

Again:

Eripite nos ex miseris,  
Eripite nos ex faucibus eorum,  
Quorum crudelitas nostro sanguine non potest expleri.  
*De oratore, l. 1. § 52.*

This order of words or members gradually increasing in length, may, so far as concerns the pleasure of sound, be denominated *a climax in sound*.

With respect to the music of periods as united in a discourse this depends chiefly on variety. Hence a rule for arranging the members of different periods with

uage. with relation to each other, That to avoid a tedious uniformity of found and cadence, the arrangement, the cadence, and the length of the members, ought to be diversified as much as possible: and if the members of different periods be sufficiently diversified, the periods themselves will be equally so.

II. *With respect to signification.* The beauties of language with respect to signification, may not improperly be distinguished into two kinds: first, the beauties that arise from a right choice of words or materials for constructing the period; and next, the beauties that arise from a due arrangement of these words or materials.

1. Communication of thought being the chief end of language, it is a rule, That perspicuity ought not to be sacrificed to any other beauty whatever. Nothing therefore in language ought more to be studied, than to prevent all obscurity in the expression; for to have no meaning, is but one degree worse than to have a meaning that is not understood. We shall here give a few examples where the obscurity arises from a wrong choice of words.

Livy, speaking of a rout after a battle, "Multique in ruina *major* quam fuga oppressi obruncatiue." This author is frequently obscure by expressing but part of his thought, leaving it to be completed by his reader. His description of the sea-fight, *l. 28. cap. 30.* is extremely perplexed.

Unde tibi reditum certo subtemine Parcæ  
Rupere.

*Hor.*

Qui persæpe cava testudine flevit amorem,  
*Non elaboratum ad pedem.*

*Id.*

Me fabulosæ Vulture in Appulo,  
Altricis extra limen Apuliæ,  
Ludo, fatigatumque somno,  
Fronde nova puerum palumbes  
Texere.

*Id.*

Puræ rivus aquæ, silvaque jugerum  
Paucorum, et segetis certa fides mææ,  
Fulgentem imperio fertilis Africæ  
*Fallit forte beator.*

*Id.*

Cum fas atque nefas exiguo *sine* libidinum  
Discernunt avidi.

*Id.*

Ac spem fronte feremat.

*Virg.*

The rule next in order is, That the language ought to correspond to the subject: heroic actions or sentiments require elevated language; tender sentiments ought to be expressed in words soft and flowing; and plain language void of ornament, is adapted to subjects grave and didactic. Language may be considered as the dress of thought; and where the one is not suited to the other, we are sensible of incongruity, in the same manner as where a judge is dressed like a fop, or a peasant like a man of quality. Where the impression made by the words resembles the impression made by the thought, the similar emotions mix sweetly in the mind, and double the pleasure; but where the impressions made by the thought and the words are dissimilar, the unnatural union they are forced into is disagreeable.

This concordance between the thought and the

words has been observed by every critic, and is so well understood as not to require any illustration. But there is a concordance of a peculiar kind that has scarcely been touched in works of criticism, though it contributes to neatness of composition. It is what follows.

In a thought of any extent, we commonly find some parts intimately united, some slightly, some disjointed, and some directly opposed to each other. To find these conjunctions and disjunctions imitated in the expression, is a beauty; because such imitation makes the words concordant with the sense. This doctrine may be illustrated by a familiar example: When we have occasion to mention the intimate connection that the soul hath with the body, the expression ought to be, *the soul and body*; because the article *the*, relative to both, makes a connection in the expression, resembling in some degree the connection in the thought: but when the soul is distinguished from the body, it is better to say *the soul and the body*; because the disjunction in the words resembles the disjunction in the thought. We proceed to other examples, beginning with conjunctions.

"Constituit agmen; et expedire tela animosque, equitibus jussis," &c. *Livy, l. 38. § 25.* Here the words that express the connected ideas are artificially connected by subjecting them both to the regimen of one verb. And the two following are of the same kind.

"Quum ex paucis quotidie aliqui eorum caderent aut vulnerarentur, et qui superarent, fessii et corporibus et animis essent," &c. *Ibid. § 29.*

Post acer Mnestheus adducto constitit arcu,  
Alta petens, pariterque oculos telumque tetendit.

*Æneid, v. 507.*

But to justify this artificial connection among the words, the ideas they express ought to be intimately connected; for otherwise that concordance which is required between the sense and the expression will be impaired. In that view, the following passage from Tacitus is exceptionable; where words that signify ideas very little connected, are however forced into an artificial union. "Germania omnis a Gallis, Rhetiisque, et Pannoniis, Rheno et Danubio fluminibus; a Sarmatis Dacisque, mutuo metu aut montibus separatur."

Upon the same account, the following passage seems equally exceptionable.

————— The fiend look'd up, and *knew*  
His mounted scale aloft; nor more, but fled  
Murm'ring, and with him fled the shades of night.

*Paradise Lost, B. iv. at the end.*

There is no natural connection between a person's flying or retiring, and the succession of day-light to darkness; and therefore to connect artificially the terms that signify these things cannot have a sweet effect.

Two members of a thought connected by their relation to the same action, will naturally be expressed by two members of the period governed by the same verb; in which case these members, in order to improve their connection, ought to be constructed in the same manner. This beauty is so common among good writers as to have been little attended to; but the neglect of it is remarkably disagreeable: for example, "He did

Language. not mention Leonora, nor that her father was dead." Better thus: "He did not mention Leonora, nor her father's death."

Where two ideas are so connected as to require but a copulative, it is pleasant to find a connection in the words that express these ideas, were it even so slight as where both begin with the same letter. Thus,

"The peacock, in all his pride, does not display half the colour that appears in the garments of a British lady, when she is either dressed for a ball or a birthday." *Speet.*

"Had not my dog of a steward run away as he did, without making up his accounts, I had still been immersed in sin and sea-coal." *Id.*

My life's companion, and my bosom-friend,  
One faith, one fame, one fate shall both attend.

Dryden, *Translation of Æneid.*

Next as to examples of disjunction and opposition in the parts of the thought, imitated in the expression; an imitation that is distinguished by the name of *antithesis*.

Speaking of Coriolanus soliciting the people to be made consul:

With a proud heart he wore his humble weeds.

*Coriolanus.*

"Had you rather Cæsar were living, and die all slaves, than that Cæsar were dead, to live all free men?"

*Julius Cæsar.*

He hath cool'd my friends and heated mine enemies.

*Shakespeare.*

An artificial connection among the words, is undoubtedly a beauty when it represents any peculiar connection among the constituent parts of the thought; but where there is no such connection, it is a positive deformity, because it makes a discordance between the thought and expression. For the same reason, we ought also to avoid every artificial opposition of words where there is none in the thought. This last, termed *verbal antithesis*, is studied by low writers, because of a certain degree of liveliness in it. They do not consider how incongruous it is, in a grave composition, to cheat the reader, and to make him expect a contrast in the thought, which upon examination is not found there.

A fault directly opposite to the last mentioned, is to conjoin artificially words that express ideas opposed to each other. This is a fault too gross to be in common practice; and yet writers are guilty of it in some degree, when they conjoin by a copulative things transacted at different periods of time. Hence a want of neatness in the following expression: "The nobility too, whom the king had no means of retaining by suitable offices and preferments, had been seized with the general discontent, and unwarily threw themselves into the scale which began already too much to preponderate." *Hume.* In periods of this kind, it appears more neat to express the past time by the participle passive, thus: "The nobility having been seized with the general discontent, unwarily threw themselves," &c. or, "The nobility, who had been seized, &c. unwarily threw themselves," &c.

It is unpleasant to find even a negative and affirmative proposition connected by a copulative:

N<sup>o</sup> 174.

If it appear not plain, and prove untrue,  
Deadly divorce 'tween me and you.

*Shakespeare.*

In mirth and drollery it may have a good effect to connect verbally things that are opposite to each other in the thought. Example; Henry IV. of France introducing the Marechal Biron to some of his friends, "Here, gentlemen (says he) is the Marechal Biron, whom I freely present both to my friends and enemies."

This rule of studying uniformity between the thought and expression may be extended to the construction of sentences or periods. A sentence or period ought to express one entire thought or mental proposition; and different thoughts ought to be separated in the expression by placing them in different sentences or periods. It is therefore offending against neatness, to crowd into one period entire thoughts requiring more than one; which is joining in language things that are separated in reality. Of errors against this rule take the following examples.

"Behold, thou art fair, my beloved, yea pleasant: also our bed is green."

Burnet, in the history of his own times, giving Lord Sunderland's character, says; "His own notions were always good; but he was a man of great expence."

"I have seen a woman's face break out in heats, as she has been talking against a great lord, whom she had never seen in her life; and indeed never knew a party-woman that kept her beauty for a twelvemonth." *Speet.*

Lord Bolingbroke, speaking of Strada: "I single him out among the moderns, because he had the foolish presumption to censure Tacitus, and to write history himself; and your lordship will forgive this short excursion in honour of a favourite writer."

To crowd into a single member of a period different subjects, is still worse than to crowd them into one period:

— — — — — Trojam genitore Adamaflo  
Paupere (mansissetque utinam fortuna) profectus.

*Æneid* iii. 614.

From conjunctions and disjunctions in general, we proceed to comparisons, which make one species of them, beginning with similes. And here also, the intimate connection that words have with their meaning requires, that in describing two resembling objects, a resemblance in the two members of the period ought to be studied. To begin with examples of resemblances expressed in words that have no resemblance.

"I have observed of late, the style of some great ministers very much to exceed that of any other productions." *Swift.* This, instead of studying the resemblance of words in a period that expresses a comparison, is going out of one's road to avoid it. Instead of *productions*, which resemble not ministers great nor small, the proper word is *writers* or *authors*.

"I cannot but fancy, however, that this imitation, which passes so currently with *other judgments*, must at some time or other have stuck a little with your *lordship*." *Shafesb.* Better thus: "I cannot but fancy, however, that this imitation, which passes so currently with *others*, must at some time or other have stuck a little with your *lordship*."

"A

uage. "A glutton or mere sensualist is as ridiculous as the other two characters." *Id.*

"They wisely prefer the generous efforts of goodwill and affection, to the reluctant compliances of such as obey by force." *Bolingb.*

It is a still greater deviation from congruity, to affect not only variety in the words, but also in the construction.

*Hume* speaking of *Shakespeare*: "There may remain a suspicion that we over-rate the greatness of his genius, in the same manner as bodies appear more gigantic on account of their being disproportioned and mishapen." This is studying variety in a period where the beauty lies in uniformity. Better thus: "There may remain a suspicion that we over rate the greatness of his genius, in the same manner as we over-rate the greatness of bodies that are disproportioned and mishapen."

Next of comparison where things are opposed to each other. And here it must be obvious, that if resemblance ought to be studied in the words which express two resembling objects, there is equal reason for studying opposition in the words which express contrasted objects. This rule will be best illustrated by examples of deviations from it.

"A friend exaggerates a man's virtues; an enemy inflames his crimes." *Speæ.* Here the opposition in the thought is neglected in the words; which at first view seem to import, that the friend and enemy are employed in different matters, without any relation to each other, whether of resemblance or of opposition. And therefore the contrast or opposition will be better marked by expressing the thought as follows: "A friend exaggerates a man's virtues, an enemy his crimes."

"The wise man is happy when he gains his own approbation; the fool when he recommends himself to the applause of those about him." *Id.* Better: "The wise man is happy when he gains his own approbation, the fool when he gains that of others."

We proceed to a rule of a different kind. During the course of a period, the scene ought to be continued without variation: the changing from person to person, from subject to subject, or from person to subject, within the bounds of a single period, distracts the mind, and affords no time for a solid impression.

*Hook*, in his Roman history, speaking of *Eumenes*, who had been beat to the ground with a stone, says, "After a short time he came to himself; and the next day they put him on board his ship, which conveyed him first to Corinth, and thence to the island of *Ægina*."

The following period is unpleasant, even by a very slight deviation from the rule: "That sort of instruction which is acquired by inculcating an important moral truth," &c. This expression includes two persons, one acquiring, and one inculcating; and the scene is changed without necessity. To avoid this blemish, the thought may be expressed thus: "That sort of instruction which is afforded by inculcating," &c.

The bad effect of such a change of person is remarkable in the following passage: "The Britons, daily harassed by cruel inroads from the Picts, were forced

to call in the Saxons for their defence, who consequent-ly reduced the greatest part of the island to their own power, drove the Britons into the most remote and mountainous parts, and the rest of the country, in customs, religion, and language, became wholly Saxon." *Swift.* Language.

The following passage has a change from subject to person: "This prostitution of praise is not only a deceit upon the gross of mankind, who take their notion of characters from the learned; but also the better sort must by this means lose some part at least of that desire of fame which is the incentive to generous actions, when they find it promiscuously bestowed on the meritorious and undeserving." *Guardian*, N<sup>o</sup> 4.

The present head, which relates to the choice of materials, shall be closed with a rule concerning the use of copulatives. *Longinus* observes, that it animates a period to drop the copulatives; and he gives the following example from *Xenophon*: "Closing their shields together, they were push'd, they fought, they slew, they were slain." The reason may be what follows. A continued sound, if not loud, tends to lay us asleep: an interrupted sound rouses and animates by its repeated impulses: thus feet composed of syllables, being pronounced with a sensible interval between each, make more lively impressions than can be made by a continued sound. A period of which the members are connected by copulatives, produceth an effect upon the mind approaching to that of a continued sound; and therefore the suppressing copulatives must animate a description. It produces a different effect akin to that mentioned: the members of a period connected by proper copulatives, glide smoothly and gently along; and are a proof of sedateness and leisure in the speaker: on the other hand, one in the hurry of passion, neglecting copulatives and other particles, expresses the principal image only; and for that reason, hurry or quick action is best expressed without copulatives:

Veni, vidi, vici.

— Ite:

Ferte citi flammam, date vela, impellite remos.

*Æneid.* iv. 593.

Quis globus, O cives, caligine volvitur aura?

Ferte citi ferrum, date tela, scandite muros?

Holtis adest, eja.

*Æneid.* ix. 37.

In this view *Longinus* justly compares copulatives in a period to strait tying, which in a race obstructs the freedom of motion.

It follows, that a plurality of copulatives in the same period ought to be avoided; for if the laying aside copulatives give force and liveliness, a redundancy of them must render the period languid. The following instance may be appealed to, though there are but two copulatives: "Upon looking over the letters of my female correspondents, I find several from women complaining of jealous husbands; and at the same time protesting their own innocence, and desiring my advice upon this occasion." *Speæ.*

Where the words are intended to express the coldness of the speaker, there indeed the redundancy of copulatives is a beauty:

' Dining one day at an alderman's in the city, Peter observed him expatiating after the manner of his bre

Language.

“ thren in the praises of his surloin of beef. “ Beef (said the sage magistrate) is the king of meat: beef comprehends in it the quintessence of partridge, and quail, and venison, and pheasant, and plum-pudding, and custard.” *Tale of a Tub*, § 4. And the author shows great delicacy of taste by varying the expression in the mouth of Peter, who is represented more animated: “ Bread (says he). dear brothers, is the staff of life; in which bread is contained, *inclusive*, the quintessence of beef, mutton, veal, venison, partridge, plum-pudding, and custard.”

Another case must also be excepted. Copulatives have a good effect where the intention is to give an impression of a great multitude consisting of many divisions; for example: ‘The army was composed of Grecians, and Carians, and Lycians, and Pamphyliaus, and Phrygians.’ The reason is, that a leisurely survey, which is expressed by the copulatives, makes the parts appear more numerous than they would do by a hasty survey: in the latter case, the army appears in one group; in the former, we take as it were an accurate survey of each nation, and of each division.

2. To pave the way for the rules of arrangement, it will be here necessary to explain the difference between a natural style and that where transposition or inversion prevails. In a natural style, relative words are by juxtaposition connected with those to which they relate, going before or after, according to the peculiar genius of the language. Again, a circumstance connected by a preposition, follows naturally the word with which it is connected. But this arrangement may be varied, when a different order is more beautiful: a circumstance may be placed before the word with which it is connected by a preposition; and may be interjected even between a relative word and that to which it relates. When such liberties are frequently taken, the style becomes inverted or transposed.

But as the liberty of inversion is a capital point in the present subject, it will be necessary to examine it more narrowly, and in particular to trace the several degrees in which an inverted style recedes more and more from that which is natural. And first, as to the placing a circumstance before the word with which it is connected, this is the easiest of all inversion, even so easy as to be consistent with a style that is properly termed *natural*: witness the following examples.

“ In the sincerity of my heart, I profess,” &c.

“ By our own ill management, we are brought to so low an ebb of wealth and credit, that,” &c.

“ On Thursday morning there was little or nothing transacted in Change-alley.”

“ At St Bride’s church in Fleetstreet, Mr Woolston (who writ against the miracles of our Saviour), in the utmost terrors of conscience, made a public recantation.”

The interjecting a circumstance between a relative word and that to which it relates, is more properly termed *inversion*; because, by a disjunction of words intimately connected, it recedes farther from a natural style. But this licence has degrees; for the disjunction is more violent in some cases than in others.

In nature, though a subject cannot exist without its qualities, nor a quality without a subject; yet in our conception of these, a material difference may be remarked. We cannot conceive a quality but as belong-

ing to some subject: it makes indeed a part of the idea which is formed of the subject. But the opposite holds not; for though we cannot form a conception of a subject void of all qualities, a partial conception may be formed of it, abstracting from any particular quality: we can, for example, form the idea of a fine Arabian horse without regard to his colour, or of a white horse without regard to his size. Such partial conception of a subject is still more easy with respect to action or motion, which is an occasional attribute only, and has not the same permanency with colour or figure: we cannot form an idea of motion independent of a body; but there is nothing more easy than to form an idea of a body at rest. Hence it appears, that the degree of inversion depends greatly on the order in which the related words are placed: when a substantive occupies the first place, the idea it suggests must subsist in the mind at least for a moment, independent of the relative words afterward introduced; and that moment may without difficulty be prolonged by interjecting a circumstance between the substantive and its connections. This liberty therefore, however frequent, will scarce alone be sufficient to denominate a style *inverted*. The case is very different, where the word that occupies the first place denotes a quality or an action; for as these cannot be conceived without a subject, they cannot without greater violence be separated from the subject that follows; and for that reason, every such separation by means of an interjected circumstance belongs to an inverted style.

To illustrate this doctrine, examples are necessary. In the following, the word first introduced does not imply a relation:

— — — Nor Eve to iterate  
Her former trespass fear’d.

————— Hunger and thirst at once,  
Powerful persuaders, quicken’d at the scent  
Of that alluring fruit, urg’d me fo keen.

Moon that now meet’st the orient sun, now flie’st  
With the six’d stars, fixed in their orb that flie,  
And ye five other wand’ring fires that move  
In mystic dance not without song, refund  
His praise.

Where the word first introduced imports a relation, the disjunction will be found more violent:

Of man’s first disobedience, and the fruit  
Of that forbidden tree, whose mortal taste  
Brought death into the world, and all our woe,  
With loss of Eden, till one greater man  
Restore us, and regain the blisful feat,  
Sing heav’nly muse.

————— Upon the firm opacous globe  
Of this round world, whose first convex dividea  
The luminous inferior orbs, inclos’d  
From chaos and th’ inroad of darkness old,  
Satan alighted walks.

————— On a sudden open fly,  
With impetuous recoil and jarring found,  
Th’ infernal doors.

————— Wherein remain’d,  
For what could else? to our almighty foe  
Clear victory, to our part loss and rout.

Language

Language. Language would have no great power, were it confined to the natural order of ideas: By inversion a thousand beauties may be compassed, which must be relinquished in a natural arrangement.

*Rules.* 1. In the arrangement of a period, as well as in a right choice of words, the first and great object being perspicuity, the rule above laid down, that perspicuity ought not to be sacrificed to any other beauty, holds equally in both. Ambiguities occasioned by a wrong arrangement are of two sorts; one where the arrangement leads to a wrong sense, and one where the sense is less doubtful. The first, being the more culpable, shall take the lead, beginning with examples of words put in a wrong place.

"How much the imagination of such a presence must exalt a genius, we may observe *merely* from the influence which an ordinary presence has over men." *Shafesb.* This arrangement leads to a wrong sense: the adverb *merely* seems by its position to affect the preceding word; whereas it is intended to affect the following words, *an ordinary presence*; and therefore the arrangement ought to be thus: "How much the imagination of such a presence must exalt a genius, we may observe from the influence which an ordinary presence *merely* has over men." [Or better],—"which even an ordinary presence has over men."

"Sixtus the Fourth was, if I mistake not, a great collector of books at least." *Boling.* The expression here leads evidently to a wrong sense; the adverb *at least*, ought not to be connected with the substantive *books*, but with *collector*, thus: "Sixtus the Fourth was a great collector at least, of books."

Speaking of Louis XIV. "If he was not the greatest king, he was the best actor of majesty at least that ever filled a throne." *Id.* Better thus: "If he was not the greatest king, he was at least the best actor of majesty," &c. This arrangement removes the wrong sense occasioned by the juxtaposition of *majesty* and *at least*.

The following examples are of a wrong arrangement of members.

"I have confined myself to those methods for the advancement of piety, which are in the power of a prince limited like ours by a strict execution of the laws." *Swift.* The structure of this period leads to a meaning which is not the author's, viz. power limited by a strict execution of the laws. That wrong sense is removed by the following arrangement: "I have confined myself to those methods for the advancement of piety, which, by a strict execution of the laws, are in the power of a prince limited like ours."

"This morning, when one of lady Lizard's daughters was looking over some hoods and ribbands brought by her tirewoman, with great care and diligence, I employed no less in examining the box which contained them." *Guardian.* The wrong sense occasioned by this arrangement, may be easily prevented by varying it thus: "This morning, when, with great care and diligence, one of Lady Lizard's daughters was looking over some hoods and ribbands," &c.

"A great stone that I happened to find after a long search by the sea-shore, served me for an anchor." *Swift.* One would think that the search was confined to the sea-shore; but as the meaning is, that the great

stone was found by the sea-shore, the period ought to be arranged thus: "A great stone that, after a long search, I happened to find by the sea-shore, served me for an anchor." Language.

Next of a wrong arrangement where the sense is left doubtful; beginning, as in the former sort, with examples of a wrong arrangement of words in a member.

"These forms of conversation *by degrees* multiplied and grew troublesome." *Speel.* Here it is left doubtful whether the modification *by degrees* relates to the preceding member or to what follows: it should be, "These forms of conversation multiplied by degrees."

"Nor does this false modesty expose us *only* to such actions as are indiscreet, but very often to such as are highly criminal." *Speel.* The ambiguity is removed by the following arrangement: "Nor does this false modesty expose us to such actions only as are indiscreet," &c.

"The empire of Blefuscu is an island situated to the north-east side of Lilliput, from whence it is parted *only* by a channel of 800 yards wide." *Swift.* The ambiguity may be removed thus: ————— "from whence it is parted by a channel of 800 yards wide only."

In the following examples the sense is left doubtful by wrong arrangement of members.

"The minister who grows less by his elevation, like a little statue placed on a mighty pedestal, will always have his jealousy strong about him." *Bolingb.* Here, so far as can be gathered from the arrangement, it is doubtful, whether the object introduced by way of simile relates to what goes before or to what follows. The ambiguity is removed by the following arrangement: "The minister who, like a little statue placed on a mighty pedestal, grows less by his elevation, will always," &c.

Speaking of the superstitious practice of locking up the room where a person of distinction dies: "The knight, seeing his habitation reduced to so small a compass, and himself in a manner shut out of his own house, upon the death of his mother, ordered all the apartments to be flung open, and exorcised by his chaplain." *Speel.* Better thus: "The knight, seeing his habitation reduced to so small a compass, and himself in a manner shut out of his own house, ordered, upon the death of his mother, all the apartments to be flung open."

Speaking of some indecencies in conversation: "As it is impossible for such an irrational way of conversation to last long among a people that make any profession of religion, or show of modesty, if the country gentlemen get into it, they will certainly be left in the lurch." *Id.* The ambiguity vanishes in the following arrangement: ————— "the country gentlemen, if they get into it, will certainly be left in the lurch."

"And since it is necessary that there should be a perpetual intercourse of buying and selling, and dealing upon credit, where fraud is permitted or connived at, or hath no law to punish it, the honest dealer is always undone, and the knave gets the advantage." *Swift.* Better thus: "And since it is necessary that there should be a perpetual intercourse of buying and selling, and dealing upon credit, the honest dealer,

Language. where fraud is permitted or connived at, or hath no law to punish it, is always undone, and the knave gets the advantage."

From these examples, the following observation will occur: That a circumstance ought never to be placed between two capital members of a period; for by such situation it must always be doubtful, so far as we gather from the arrangement, to which of the two members it belongs: where it is interjected, as it ought to be, between parts of the member to which it belongs, the ambiguity is removed, and the capital members are kept distinct, which is a great beauty in composition. In general, to preserve members distinct that signify things distinguished in the thought, the best method is, to place first in the consequent member, some word that cannot connect with what precedes it.

If it shall be thought, that the objections here are too scrupulous, and that the defect of perspicuity is easily supplied by accurate punctuation; the answer is, That punctuation may remove an ambiguity, but will never produce that peculiar beauty which is perceived when the sense comes out clearly and distinctly by means of a happy arrangement. Such influence has this beauty, that, by a natural transition of perception, it is communicated to the very sound of the words, so as in appearance to improve the music of the period. But as this curious subject comes in more properly elsewhere, it is sufficient at present to appeal to experience, that a period, so arranged as to bring out the sense clear, seems always more musical than where the sense is left in any degree doubtful.

The next rule is, That words expressing things connected in the thought, ought to be placed as near together as possible. This rule is derived immediately from human nature, prone in every instance to place together things in any manner connected: where things are arranged according to their connections, we have a sense of order; otherwise we have a sense of disorder, as of things placed by chance: and we naturally place words in the same order in which we would place the things they signify. The bad effect of a violent separation of words or members thus intimately connected, will appear from the following examples.

"For the English are naturally fanciful, and very often disposed, by that gloominess and melancholy of temper which is so frequent in our nation, to many wild notions and visions, to which others are not so liable." *Speel.* Here the verb or assertion is, by a pretty long circumstance, violently separated from the subject to which it refers: this makes a harsh arrangement; they less excusable that the fault is easily prevented by placing the circumstance before the verb, after the following manner: "For the English are naturally fanciful, and by that gloominess and melancholy of temper which is so frequent in our nation, are often disposed to many wild notions, &c."

"From whence we may date likewise the rivalship of the house of France, for we may reckon that of Valois and that of Bourbon as one upon this occasion, and the house of Austria, that continues at this day, and has oft cost so much blood and so much treasure in the course of it." *Bolingbr.*

"It cannot be impertinent or ridiculous therefore in

such a country, whatever it might be in the abhor of St Real's, which was Savoy, I think; or in Peru, under the Incas, where Garcilasso de la Vega says it was lawful for none but the nobility to study—for men of all degrees to instruct themselves in those affairs wherein they may be actors, or judges of those that act, or controllers of those that judge." *Ibid.*

"If Scipio, who was naturally given to women, for which anecdote we have, if I mistake not, the authority of Polybius, as well as some verses of Nevius preferred by Aulus Gellius, had been educated by Olympias at the court of Philip, it is improbable that he would have restored the beautiful Spaniard." *Ibid.*

If any one have a curiosity for more specimens of this kind, they will be found without number in the works of the same author.

A pronoun, which saves the naming a person or thing a second time, ought to be placed as near as possible to the name of that person or thing. This is a branch of the foregoing rule; and with the reason there given, another occurs, viz That if other ideas intervene, it is difficult to recal the person or thing by reference.

"If I had leave to print the Latin letters transmitted to me from foreign parts, they would fill a volume, and be a full defence against all that Mr Partridge, or his accomplices of the Portugal inquisition, will be ever able to object; *who*, by the way, are the only enemies my predictions have ever met with at home or abroad." Better thus:—"and be a full defence against all that can be objected by Mr Partridge, or his accomplices of the Portugal inquisition; *who*, by the way, are," &c.

"There being a round million of creatures in human figure, throughout this kingdom, *whose* whole subsistence," &c. *Swift.* Better: "There being, throughout this kingdom, a round million of creatures in human figure, whose whole subsistence," &c.

The following rule depends on the communication of emotions to related objects; a principle in human nature that hath an extensive operation: and we find this operation, even where the objects are not otherwise related than by juxtaposition of the words that express them. Hence, to elevate or depress an object, one method is, to join it in the expression with another that is naturally high or low: witness the following speech of Eumenes to the Roman senate.

"Causam veniendi sibi Romam fuisse, præter cupiditatem vivendi *deos hominesque*, quorum beneficio in ea fortuna esset, supra quam ne optare quidem auderet, etiam ut coram moneret senatum ut Persei conatus obviam iret." *Livy.* To join the Romans with the gods in the same enunciation, is an artful stroke of flattery, because it tacitly puts them on a level.

On the other hand, the degrading or vilifying an object, is done successfully by ranking it with one that is really low: "I hope to have this entertainment in readiness for the next winter; and doubt not but it will please more than the opera or puppet-show." *Speel.*

"Manifold have been the judgments which Heaven from time to time, for the chastisement of a sinful people, has inflicted upon whole nations. For when the degeneracy becomes common, it is but just the punishment should be general. Of this kind, in our own unfortunate country, was that destructive pestilence,

whole

age. whose mortality was so fatal as to sweep away, if Sir William Petty may be believed, five millions of Christian souls, besides women and Jews." *Arbutnot.*

"Such also was that dreadful conflagration ensuing in this famous metropolis of London, which consumed, according to the computation of Sir Samuel Moreland, 100,000 houses, not to mention churches and stables." *Ibid.*

"But on condition it might pass into a law, I would gladly exempt both lawyers of all ages, subaltern and field officers, young heirs, dancing-masters, pick pockets, and players." *Swift.*

Sooner let earth, air, sea, to chaos fall,  
Men, monkeys, lap-dogs, parrots, perish all.  
*Rape of the Lock.*

Circumstances in a period resemble small stones in a building, employed to fill up vacancies among those of a larger size. In the arrangement of a period, such under-parts crowded together make a poor figure; and never are graceful but when interspersed among the capital parts.

"It is likewise urged, that there are, by computation, in this kingdom, above 10,000 parsons, whose revenues, added to those of my lords the bishops, would suffice to maintain, &c." *Swift.* Here two circumstances, viz. *by computation*, and *in this kingdom*, are crowded together unnecessarily. They make a better appearance separated in the following manner: "It is likewise urged, that in this kingdom there are by computation, above 10,000 parsons," &c.

If there be room for a choice, the sooner a circumstance is introduced, the better; because circumstances are proper for that coolness of mind, with which we begin a period as well as a volume: in the progress, the mind warms, and has a greater relish for matters of importance. When a circumstance is placed at the beginning of the period, or near the beginning, the transition from it to the principal subject is agreeable: it is like ascending, or going upward. On the other hand, to place it late in the period has a bad effect; for after being engaged in the principal subject, one is with reluctance brought down to give attention to a circumstance. Hence evidently the preference of the following arrangement, "Whether in any country a choice altogether unexceptionable has been made, seems doubtful;" before this other, "Whether a choice altogether unexceptionable has in any country been made," &c.

For this reason the following period is exceptionable in point of arrangement. "I have considered formerly, with a good deal of attention, the subject upon which you command me to communicate my thoughts to you." *Boling.* Which, with a slight alteration, may be improved thus: "I have formerly, with a good deal of attention, considered the subject," &c.

Swift, speaking of a virtuous and learned education: "And although they may be, and too often are, drawn by the temptations of youth, and the opportunities of a large fortune, into some irregularities, *when they come forward into the great world*; it is ever with reluctance and compunction of mind, because their bias to virtue still continues." Better; "And although, *when they come forward into the great world*, they may be, and too often," &c.

In arranging a period, it is of importance to determine in what part of it a word makes the greatest figure, whether at the beginning, during the course, or at the close. The breaking silence rouses the attention, and prepares for a deep impression at the beginning: the beginning, however, must yield to the close; which being succeeded by a pause, affords time for a word to make its deepest impression. Hence the following rule, That to give the utmost force to a period, it ought, if possible, to be closed with that word which makes the greatest figure. The opportunity of a pause should not be thrown away upon accessories, but reserved for the principal object, in order that it may make a full impression: which is an additional reason against closing a period without a circumstance. There are, however, periods that admit not such a structure; and in that case the capital word ought, if possible, to be placed in the front, which next to the close is the most advantageous for making an impression. Hence, in directing our discourse to a man of figure, we ought to begin with his name; and one will be sensible of a degradation when this rule is neglected, as it frequently is for the sake of verse. We give the following examples.

Integer vitæ, scelerisque purus,  
Non eget Mauri jaculis, neque arcu,  
Nec venenatis grævada sagittis,  
Fusce, pharetra. *Horat. Carm. l. 1. ode 22.*

Je crains Dieu, cher Abner, et n'ai point d'autre crainte.

In these examples, the name of the person addressed to, make a mean figure, being like a circumstance slipped into a corner. That this criticism is well founded, we need no other proof than Addison's translation of the last example:

O Abner! I fear my God, and I fear none but him. *Guardian, n° 117.*

O father, what intends thy hand, the cry'd,  
Against thy only son? What fury, O son,  
Possesses thee to bend that mortal dart  
Against thy father's head?

*Paradise Lost, book ii. l. 727.*

Every one must be sensible of a dignity in the invocation at the beginning, which is not attained by that in the middle. It is not meant, however, to censure this passage: on the contrary, it appears beautiful, by distinguishing the respect that is due to a father from that which is due to a son.

The substance of what is said in this and the foregoing section, upon the method of arranging words in a period, so as to make the deepest impression with respect to sound as well as signification, is comprehended in the following observation: That order of words in a period will always be the most agreeable, where, without obscuring the sense, the most important images, the most sonorous words, and the longest members, bring up the rear.

Hitherto of arranging single words, single members, and single circumstances. But the enumeration of many particulars in the same period is often necessary: and the question is, In what order they should be placed? And, first, with respect to the enumerating.

ting particulars of equal rank: As there is no cause for preferring any one before the rest, it is indifferent to the mind in what order they be viewed; therefore it is indifferent in what order they be nam'd. 2dly, If a number of objects of the same kind, differing only in size, are to be ranged along a straight line, the most agreeable order to the eye is that of an increasing series: in surveying a number of such objects, beginning at the least, and proceeding to greater and greater, the mind swells gradually with the successive objects, and in its progress has a very sensible pleasure. Precisely for the same reason, words expressive of such objects ought to be placed in the same order. The beauty of this figure, which may be termed a *climax in sense*, has escap'd Lord Bolingbroke in the first member of the following period: "Let but one, great, brave, disinterested, active man arise, and he will be received, followed, and almost adored." The following arrangement has sensibly a better effect: "Let but one brave, great, active, disinterested man arise," &c. Whether the same rule ought to be followed in enumerating men of different ranks, seems doubtful: on the one hand, a number of persons presented to the eye in form of an increasing series, is undoubtedly the most agreeable order; on the other hand, in every list of names, we set the person of the greatest dignity at the top, and descend gradually through his inferiors. Where the purpose is to honour the persons named according to their rank, the latter ought to be followed; but every one who regards himself only, or his reader, will choose the former order. 3dly, As the sense of order directs the eye to descend from the principal to its greatest accessory, and from the whole to its greatest part, and in the same order through all the parts and accessories, till we arrive at the minutest; the same order ought to be followed in the enumeration of such particulars.

When force and liveness of expression are demanded, the rule is, to suspend the thought as long as possible, and to bring it out full and entire at the close: which cannot be done but by inverting the natural arrangement. By introducing a word or member before its time, curiosity is rais'd about what is to follow; and it is agreeable to have our curiosity gratified at the close of the period: the pleasure we feel resembles that of seeing a stroke exerted upon a body by the whole collected force of the agent. On the other hand, where a period is so constructed as to admit more than one complete close in the sense, the curiosity of the reader is exhausted at the first close, and what follows appears languid or superfluous: his disappointment contributes also to that appearance, when he finds, contrary to expectation, that the period is not yet finished. Cicero, and after him Quintilian, recommend the verb to the last place. This method evidently tends to suspend the sense till the close of the period; for without the verb the sense cannot be complete: and when the verb happens to be the capital word, which it frequently is, it ought at any rate to be the last, according to another rule above laid down. The following period is placed in its natural order: "Were instruction an essential circumstance in epic poetry, I doubt whether a single instance could be given of this species of composition in any language." The period thus arranged admits a full close upon the word *composition*; after which it goes on lan-

guidly, and closes without force. This blemish will be avoided by the following arrangement: "Were instruction an essential circumstance in epic poetry, I doubt whether, in any language, a single instance could be given of this species of composition."

"Some of our most eminent divines have made use of this Platonic notion, as far as it regards the subsistence of our passions after death, with great beauty and strength of reason." *Speel*. Better thus: "Some of our most eminent divines have, with great beauty and strength of reason, made use of this Platonic notion," &c.

"Men of the best sense have been touched, more or less, with these groundless horrors and presages of futurity, upon surveying the most different works of nature." *Id.* Better, "Upon surveying the most different works of nature, men of the best sense," &c.

"She soon inform'd him of the place he was in; which, notwithstanding all its horrors, appeared to him more sweet than the bower of Mahomet, in the company of his Balsora." *Guardian*. Better, "She soon, &c. which appeared to him, in the company of his Balsora, more sweet than the bower of Mahomet."

None of the rules for the composition of periods are more liable to be abused than those last mentioned; witness many Latin writers, among the moderns especially, whose style, by inversions too violent, is rendered harsh and obscure. Suspension of the thought till the close of the period, ought never to be preferred before perspicuity. Neither ought such suspension to be attempted in a long period; because in that case the mind is bewildered amidst a profusion of words: a traveller, while he is puzzled about the road, relishes not the finest prospect: "All the rich presents which Atyages had given him at parting, keeping only some Median horses, in order to propagate the breed of them in Persia, he distributed among his friends whom he left at the court of Ecbatana." *Trav. of Cyrus*.

III. *Beauties from a resemblance between Sound and Signification*. There being frequently a strong resemblance of one sound to another, it will not be surprising to find an articulate sound resembling one that is not articulate: thus the sound of a bow-string is imitated by the words that express it:

—————The string let fly,  
*Tevang's* d' short and sharp, like the shrill swallow's cry.  
*Odyssey*, xxi. 449.

The sound of felling trees in a wood:

Loud sounds the ax, redoubling strokes on strokes,  
On all sides round the forest hurls her oaks  
Headlong. Deep echoing groan the thickets brown,  
Then rustling, crackling, crushing, thunder down.  
*Iliad*, xxiii. 144.

But when loud' surges lash the founding shore,  
The hoarse rough verse should like the torrent roar.  
*Pope's Essay on Criticism*, 369.

Dire Scylla there a scene of horror forms,  
And here Charybdis fills the deep with storms:  
When the tide rushes from her rumbling caves,  
The rough rock roars; tumultuous boil the waves.

*Pope*.

No person can be at a loss about the cause of this beauty; it is obviously that of imitation.

That

uage. That there is any other natural resemblance of found to signification, must not be taken for granted. There is no resemblance of found to motion, nor of found to sentiment. We are, however, apt to be deceived by artful pronunciation: the same passage may be pronounced in many different tones, elevated or humble, sweet or harsh, brisk or melancholy, so as to accord with the thought or sentiment: such concord must be distinguished from that concord between found and sense which is perceived in some expressions independent of artful pronunciation; the latter is the poet's work, the former must be attributed to the reader. Another thing contributes still more to the deceit: in language, found and sense being intimately connected, the properties of the one are readily communicated to the other; for example, the quality of grandeur, of sweetness, or of melancholy, though belonging to the thought solely, is transferred to the words, which by that means resemble in appearance the thought that is expressed by them. That there may be a resemblance of articulate sounds to some that are not articulate, is self-evident; and that in fact there exist such resemblances successfully employed by writers of genius, is clear from the foregoing examples, and from many others that might be given. But we may safely pronounce, that this natural resemblance can be carried no farther; the objects of the different senses differ so widely from each other, as to exclude any resemblance; found in particular, whether articulate or inarticulate, resembles not in any degree taste, smell, nor motion; and as little can it resemble any internal sentiment, feeling, or emotion. But must we then admit, that nothing but found can be imitated by found? Taking imitation in its proper sense, as importing a resemblance between two objects, the proposition must be admitted: and yet in many passages that are not descriptive of found, every one must be sensible of a peculiar concord between the found of the words and their meaning. As there can be no doubt of the fact, what remains is to enquire into its cause.

Resembling causes may produce effects that have no resemblance; and causes that have no resemblance may produce resembling effects. A magnificent building, for example, resembles not in any degree an heroic action; and yet the emotions they produce are concordant, and bear a resemblance to each other. We are still more sensible of this resemblance in a song, when the music is properly adapted to the sentiment: there is no resemblance between the thought and found; but there is the strongest resemblance between the emotion raised by music tender and pathetic, and that raised by the complaint of an unsuccessful lover. Applying this observation to the present subject, it appears, that, in some instances, the found even of a single word makes an impression resembling that which is made by the thing it signifies: witness the word *running*, composed of two short syllables; and more remarkably the words *rapidity*, *impetuosity*, *precipitation*. Brutal manners produce in the spectator an emotion not unlike what is produced by a harsh and rough found; and hence the beauty of the figurative expression, *rugged manners*. Again, the word *little*, being pronounced with a very small aperture of the

Language. mouth, has a weak and faint found, which makes an impression resembling that made by a diminutive object. This resemblance of effects is still more remarkable where a number of words are connected in a period: words pronounced in succession make often a strong impression; and when this impression happens to accord with that made by the sense, we are sensible of a complex emotion, peculiarly pleasant; one proceeding from the sentiment, and one from the melody or found of the words. But the chief pleasure proceeds from having these two concordant emotions combined in perfect harmony, and carried on in the mind to a full close. Except in the single case where found is described, all the examples given by critics of sense being imitated in found, resolve into a resemblance of effects: emotions raised by found and signification may have a resemblance; but found itself cannot have a resemblance to any thing but found.

Proceeding now to particulars, and beginning with those cases where the emotions have the strongest resemblance, we observe, first, That by a number of syllables in succession, an emotion is sometimes raised, extremely similar to that raised by successive motion; which may be evident even to those who are defective in taste, from the following fact, that the term *movement* in all languages is equally applied to both. In this manner, successive motion, such as walking, running, galloping, can be imitated by a succession of long or short syllables, or by a due mixture of both: for example, slow motion may be justly imitated in a verse where long syllables prevail; especially when aided by a slow pronunciation:

*Illi inter sese magna vi brachia tollunt.*

*Georg. iv. 174.*

On the other hand, swift motion is imitated by a succession of short syllables;

*Quadrupedante putrem sonitu quatit ungula campum.*

Again:

*Radit iter liquidum, celeres neque commovet alas.*

\* Thirdly, A line composed of monosyllables makes an impression by the frequency of its pauses, similar to what is made by laborious interrupted motion:

With many a weary step, and many a groan,  
Up the high hill he heaves a huge round stone.

*Odyssey, xi. 736.*

First march the heavy mules securely slow;  
O'er hills, o'er dales, o'er craggs, o'er rocks they go.

*Iliad, xxiii. 138.*

Fourthly, The impression made by rough sounds in succession, resembles that made by rough or tumultuous motion: on the other hand, the impression of smooth sounds resembles that of gentle motion. The following is an example of both.

Two craggy rocks projecting to the main,  
The roaring winds tempestuous rage restrain;  
Within, the waves in softer murmurs glide,  
And ships secure without their haulers ride.

*Odyssey, iii. 118.*

Another example of the latter:

Soft

Language. Soft is the strain when Zephyr gently blows,  
And the smooth stream in smoother numbers flows.

*Essay on Criticism*, 366.

Fifthly, Prolonged motion is expressed in an Alexandrine line. The first example shall be of a slow motion prolonged :

A needless Alexandrine ends the song ;  
That, like a wounded snake, drags its slow length  
along.

*Il.* 356.

The next example is of forcible motion prolonged :

The waves behind impel the waves before,  
Wide-rolling, foaming high, and tumbling to the shore.  
*Iliad*, xiii. 1004.

The last shall be of rapid motion prolonged :

Not so when swift Camilla scours the plain,  
Flies o'er the unbending corn, and skims along the  
main.

*Essay on Criticism*, 373.

Again, speaking of a rock torn from the brow of a  
mountain :

Still gathering force, it smokes, and, urg'd amain,  
Whirls, leaps, and thunders down impetuous to the  
plain.

*Iliad*, xiii. 197.

Sixthly, A period consisting mostly of long syllables, that is, of syllables pronounced slow, produceth an emotion resembling faintly that which is produced by gravity and solemnity. Hence the beauty of the following verse :

Olli sedato respondet corde Latinus.

It resembles equally an object that is insipid and uninteresting.

Tædet quotidianarum harum formarum.

*Terence*.

Seventhly, A slow succession of ideas is a circumstance that belongs equally to settled melancholy, and to a period composed of polysyllables pronounced slow ; and hence, by similarity of emotions, the latter is imitative of the former :

In those deep solitudes, and awful cells,  
Where heav'nly-pensive Contemplation dwells,  
And ever-musing Melancholy reigns.

*Pope, Eloisa to Abelard*.

Eighthly, A long syllable made short, or a short syllable made long, raises, by the difficulty of pronouncing contrary to custom, a feeling similar to that of hard labour :

When Ajax strives some rock's vast weight to throw,  
The line too labours, and the words move slow.

*Essay on Criticism*, 370.

Ninthly, Harsh or rough words pronounced with difficulty, excite a feeling similar to that which proceeds from the labour of thought to a dull writer :

N<sup>o</sup> 174.

Just writes to make his barrenness appear,  
And strains from hard-bound brains eight lines a-year.  
*Pope's Epistle to Dr Arbuthnot*, l. 181.

We shall close with one example more, which of all makes the finest figure. In the first section mention is made of a climax in sound ; and in the second of a climax in sense. It belongs to the present subject to observe, that when these coincide in the same passage, the concordance of sound and sense is delightful : the reader is conscious of pleasure not only from the two climaxes separately, but of an additional pleasure from their concordance, and from finding the sense so justly imitated by the sound. In this respect, no periods are more perfect than those borrowed from Cicero in the first section.

The concord between sense and sound is not less agreeable in what may be termed an *anticlimax*, where the progress is from great to little ; for this has the effect to make diminutive objects appear still more diminutive. Horace affords a striking example :

Parturiunt montes, nascetur ridiculus mus.

The arrangement here is singularly artful : the first place is occupied by the verb, which is the capital word by its sense as well as sound : the close is reserved for the word that is the meanest in sense as well as in sound : and it must not be overlooked, that the resembling sounds of the two last syllables give a ludicrous air to the whole.

In this article we have mentioned none of the beauties of language but what arise from words taken in their proper sense. Beauties that depend on the metaphorical and figurative power of words, are treated under the separate articles of FIGURES, PERSONIFICATION, APOSTROPHE, HYPERBOLE, METAPHOR, &c. See also ORATORY.

*Purity of LANGUAGE*. Both the Greeks and Romans were particularly careful of preserving the purity of their language. It seems amongst the Romans to have been a point which they thought worthy the attention of the state itself ; for we find the Cumeans not daring to make use of the Latin language in their public acts without having first obtained leave in form. Tiberius himself would not hazard the word *monopolium* in the senate without making an excuse for employing a foreign term. Seneca gives it as a certain maxim, that wherever a general false taste in style and expression prevails, it is an infallible sign of a corruption of manners in that people : A liberty of introducing obsolete words, or forming new ones, is a mark, he thinks, of an equal licentiousness of the moral kind. Accordingly it is observed, there are scarce more than eight or ten instances of new words to be produced from the most approved Roman writers, in the course of two or three centuries. If this mode of reasoning concerning the morals of the state was introduced and applied in our own country, no nation on the face of the earth could appear more abandoned ; for no nation is more fond of adopting new words, though our language is sufficiently copious. This delicacy of Seneca appears to be carried a little too far, and his manner of estimating the morals of the people must be a little fallacious. The Greeks were very remarkable

for

angued for their discernment of provincialisms, especially the Athenians, whose dialect was inconceivably sweet and elegant

began with the sum of 100 crowns, but soon obtained considerable donations; and the duke of Orleans regent of the kingdom, granted him a lottery, and laid the first stone of the porch in 1718. It was consecrated in 1745, after M. Languet had spared neither labour nor expence to render it one of the finest churches in the world both for architecture and ornament. Another work which did him no less honour was the *Maison de l'enfant Jesus*. This establishment consists of two parts; the first composed of about 35 poor ladies of good families, and the second of more than 400 poor women and children of town and country. The order and economy in this house, for the education and employment of so many persons, gave cardinal Fleury so high an idea of the vicar of St Sulpice, that he proposed to make him superintendant-general of all the hospitals in the kingdom; which, however, was declined. Never man took more pains than he did to procure charitable donations and legacies, which he distributed with admirable discretion: he is said from good authority to have disbursed near a million of livres to the poor annually. When there was a general dearth in 1725, he sold, in order to relieve the poor, his household goods, pictures, and some curious pieces of furniture that he had procured with difficulty; and when the plague raged at Marseilles, he sent large sums into Provence for the relief of the distressed. M. Languet was not only singular in this warm, disinterested, benevolent conduct, but also in another circumstance equally rare; and this was in the refusal of several bishoprics that were offered him: he resigned even his vicarage in 1748; but continued to preach every Sunday at his own parish-church, and to support the *Maison de l'enfant Jesus*, to his death, which happened in 1750. It is observed, that his piety and charity did not proceed from poverty of talents; for he was sensible and lively in conversation, and his genius often discovered itself in his agreeable repartees.

Languet  
||  
Lanard.

LANGUED, in heraldry, expresses such animals whose tongue, appearing out of the mouth, is borne of a different colour from the rest of the body.

LANGUEDOC, a large and maritime province of France; bounded on the north by Quercy, Rouerque, Auvergne, and Lionnois; on the east by Dauphny and Provence; on the west by Gascony; and on the south by the Mediterranean Sea and Roussillon. It is 225 miles in length, and 100 in breadth where broadest. The clergy are more rich and numerous here than in the rest of France, there being three archbishops and 20 bishops. Languedoc is divided into the Upper and Lower; and in general it is a very pleasant country, fertile in corn, fruits, and excellent wines; and the inhabitants carry on a considerable trade. There are many curious medicinal plants, with iron mines, quarries of marble, and turquois stones. There is also a great deal of kelp, and on the heats are considerable numbers of the kermes oak. The principal rivers are the Rhone, the Garonne, the Aude, the Tarn, the Allier, and the Loire. There are also a great number of mineral springs. Thoulouse is the capital town. This province is famous for the royal canal, which divides it in two, joining the Mediterranean with the Atlantic Ocean. This canal was undertaken in 1666, and finished in 1680; the mathematician who undertook it made a basin 400 yards long, 300 broad, and 7 feet deep, which is always kept full of water, and may be let out by means of a sluice on the side of the Mediterranean, as well as by another on the side of the Atlantic.

LANGUET (Hubert), born at Viteaux in Burgundy in 1518, gained great reputation by his learning and virtue in the 16th century. Having read one of Melancthon's books at Bologna, he conceived for him an esteem for the author, that he went to Wirtemberg purposely to visit him; he arrived there in 1549, when he contracted a strict friendship with Melancthon, and embraced the Protestant religion. In 1565, he was one of the first counsellors of Augustus elector of Saxony, who employed him in several important affairs and negociations. He was afterwards admitted to the confidence of William prince of Orange; and died at Antwerp, on the 30th of September 1581. We have many of his letters written in Latin to Sir Philip Sydney, to Camerarius the father and son, and to Augustus elector of Saxony, which have been several times reprinted, in three volumes; and there is also attributed to him a famous treatise, intitled, *Vindicie contra Tyrannos*, and other works. His life is written by Philibert de la Mare.

LANGUET (John Baptist Joseph), the celebrated vicar of St Sulpice at Paris, and a doctor of the Sorbonne, was born at Dijon in 1675. He was received into the Sorbonne in 1698; and attached himself to the community of St Sulpice, to which parish he was of great service. M. de la Chetardie the vicar, conscious of his talents, chose him for his curate, in which capacity he officiated near 10 years; and in 1714, succeeded to the vicarage. His parish-church being small and out of repair, he conceived the design of building a church suitable to the size of his parish, which he

LANGUOR, among physicians, signifies great weakness and loss of strength, attended with a dejection of mind; so that the patients can scarce walk or even stand upright, but are apt to faint away.

LANHAM. See LAVENHAM.

LANIARD (from *Lanier*, Fr.), a short piece of cord or line fastened to several machines in a ship, and serving to secure them in a particular place, or to manage them more conveniently. Such are the laniards of the gun-ports, the laniard of the buoy, the laniard of the cat-hook, &c.—The principal laniards used in a ship, however, are those employed to extend the shrouds and stays of the masts by their communication with the dead-eyes, so as to form a sort of mechanical power resembling that of a tackle.—These laniards are fixed in the dead-eyes as follows: one end of the laniard is thrust through one of the holes of the upper dead-eye, and then knotted, to prevent it from drawing out; the other is then passed through one of the holes in the lower dead-eye, whence, returning upward, it is inserted through the second hole in the upper dead-eye, and next through the second in the lower dead-eye, and finally through the third holes in both dead-eyes. The end of the laniard being then directed upwards from the lowest dead-eye, is stretched as stiff as possible by the application of tackles; and that the several parts of it may slide with more

Lanigerous facility through the holes in the dead-eyes, it is well smeared with hog's-lard or tallow, so that the strain is immediately communicated to all the turns at once.

LANIGEROUS, an appellation given to whatever bears wool.

LANISTA, in antiquity, is sometimes used to signify an executioner; but more frequently for a master-gladuator, who taught the use of arms, and had always people under them ready to exhibit shows of that kind. For this purpose, they either purchased gladiators, or educated children, that had been exposed, in that art.

Plates  
CCLXII and  
CCLXIII.

LANIUS, the SHRIKE, or *Butcher-bird*, in ornithology; a genus belonging to the order of accipitres, the characters of which are these: The beak is somewhat frait, with a tooth on each side towards the apex, and naked at the base; and the tongue is lacerated.

1. The exaubitor, great cinereous shrike, or greater butcher-bird, is in length 10 inches. The plumage on the upper parts is of a pale ash-colour; the under, white; through the eyes there is a black stripe: the scapulars are white: the base of the greater quills is white, the rest black: the tail is somewhat cuneiform; the two middle feathers are black; the outmost on each side, white; those between are black, with the ends more or less white: the legs are black. Its bill is black, one inch long, and hooked at the end; the upper mandible furnished with a sharp process: the nostrils are oval, covered with black bristles pointing downwards: the muscles that move the bill are very thick and strong; which makes the head very large. This apparatus is quite requisite in a species whose method of killing its prey is so singular, and whose manner of devouring it is not less extraordinary: small birds it will seize by the throat, and strangle; which probably is the reason the Germans also call this bird *wurcbangel*, or "the suffocating angel." It feeds on small birds, young nestlings, beetles, and caterpillars. When it has killed the prey, it fixes them on some thorn, and when thus spitted pulls them to pieces with its bill: on this account the Germans call it *thorntraer* and *thornfreker*. When confined in a cage, they will often treat their food in much the same manner, flicking it against the wires before they devour it.—This bird inhabits many parts of Europe and North America. The female makes its nest with heath and moss, lining it with wool and gossamer; and lays six eggs, about as big as those of a thrush, of a dull olive-green, spotted at the thickest end with black. In spring and summer it imitates the voices of other birds, by way of decoying them within reach, that it may destroy them; but beyond this, the natural note is the same throughout all seasons. If a trap-fall be baited with a living small bird, it proves a decoy, by which it may be taken in winter. It is observed to be mute when kept in a cage, though seemingly content.—In countries where they are plenty, the husbandmen value them, on supposition of their destroying rats, mice, and other vermin. They are supposed to live five or six years; and are often trained up for catching small birds in Russia. In Carniola they are migratory, coming in May and departing in September; which is the case also in respect to the few which are met with in England.

2. The collurio, or lesser butcher-bird, is seven

inches and a half in length. The irides are hazel; the bill resembles that of the preceding species: the head and lower part of the back are of a fine light grey: across the eyes from the bill runs a broad black stroke: the upper part of the back, and coverts of the wings, are of a bright ferruginous colour; the breast, belly, and sides, are of an elegant blossom colour: the two middle feathers of the tail are longest, and entirely black; the lower part of the others white, and the exterior webs of the outmost feather on each side wholly so. In the female, the stroke across the eyes is of a reddish brown; the head of a dull rust colour mixed with grey; the breast, belly, and sides, are of a dirty white, marked with semicircular dusky lines: the tail is of a deep brown; the outward feather on each side excepted, whose exterior webs are white. It is rather larger than the male. This bird is much more common than the former species. Mr Latham suspects its being a bird of passage, never having seen it in winter. It lays six white eggs marked with a rufous brown circle towards the large end. The nest is generally in a hedge or low bush; near which, it is said, no small bird chooses to build; for it not only feeds on insects, but also on the young of other birds in the nest, taking hold of them by the neck, and strangling them, beginning to eat them first at the brain and eyes. It is fonder of grasshoppers and beetles than of other insects, which it eats by morsels, and, when satisfied, flicks the remainder on a thorn; when kept in a cage, it does the same against the wires of it, like the former species. It is called in the German language by a name signifying "great head," or "bull head," from the size of that part. It will also feed on sheep's kidneys, if in a cage, eating a whole one every day. Like the cinereous shrike, it only mocks the notes of other birds, having none of its own; and this merely, like that, to decoy. It is said to be in this imitative art an adept; if money is counted over at midnight in the place where one of these is kept, so as to make a jingling noise, it begins to imitate the same sound. When sitting on the nest, the female is soon discovered; for on the approach of any one, she sets up an horrible outcry.

3. The *cœnilescens*, or fork-tailed Indian butcher-bird of Edwards, is in length about seven inches and a half: the bill is blackish brown, and bent; the upper mandible beset with black hairs turning forwards: the plumage on the upper parts of the body is a fine black, with a gloss of blue and in some lights green; the under parts are white: the greater quills and tail are of a ferruginous black; the tail is pretty much forked, and the outer feather spotted with dirty white. It inhabits Bengal, where it is called *fungab*. It is called also by the Indians the *king of the crows*, from its pursuing these birds from place to place with a great noise, and pecking them on the back till they escape.

4. The Antiguan shrike (or *Pie-grieffche d'Antigue* of Sonnerat) is about the size of a lark. Its bill is large and black; the upper mandible very long, and the curvature so excessive that one would rather take it for a monstrosity than common to any one species: the irides are dusky: the head is black; the back, of a yellowish rufous colour: the throat and breast are white; the quills, and bastard wing-coverts, black; and the wings reach only to the beginning of the tail,

which is very long and wedge-shaped; the two middle feathers are wholly black; the legs are dusky black. It inhabits Panay, one of the Philippine islands, but principally about Antigue, one of the provinces thereof.

5. The jocosus, or jocosé shrike, is in length seven inches and a half. The bill is blackish, rather straighter than in most of the genus, and furnished only with a very fine notch near the tip: the crown of the head is black, except some long brown feathers, which form a kind of crest: the sides of the head, throat, and fore part of the neck, are white; from each corner of the mouth there is a black line, continued backwards; and under each eye is a small spot of lively red: the upper parts of the body are brown; the under parts, dirty white; the vent, rose-colour: on the lower part of the neck and breast there is a kind of a brown band: the quills are brown: the tail is greatly wedge-shaped, and in colour brown, except the four outer feathers on each side, which have white tips: the legs and claws are black. This is a Chinese bird, and called in those parts by the name of *kozokai-kon*. It feeds upon rice and insects, particularly cockroaches.

6. The infaustus, or rock-shrike, is in length seven inches and three quarters. The bill is about an inch long, and blackish: the head and neck are of a dark ash-colour, marked with small rufous spots: the upper part of the back is a dark brown; the lower much paler, inclining to ash, especially towards the tail: the quills and wing-coverts are dusky, with pale margins: the breast, and under parts of the body, are orange, marked with small spots, some white and others brown: the tail is three inches in length; the two middle feathers are brown, the others rufous: the legs are blackish: the wings and tail are even. This is the description of the female. The male is said to differ very little, except in being of a brighter colour.—This species is met with in many parts of Europe, from Italy on the one hand, to Russia on the other; and is found in some parts of Germany, the Alpine mountains, those of Tyrol, and such-like places. The manners of this bird seem disputed. Buffon says that it perches on a high stone, and as soon as a marksman appears with his gun, removes to a greater distance, and so on as often as he approaches; which renders this species difficult to come at. Brunnich and Linnæus, on the contrary, say that it is a bold bird, attending the traveller while at his meal, on purpose to feed on his scraps. It has an agreeable note of its own, approaching to that of the hedge-sparrow, and will also learn to imitate that of others. It makes the nest among the holes of the rocks, &c. hiding it with great art; and lays three or four eggs, feeding the young with worms and insects, on which it also feeds itself. It may be taken young from the nest, and brought up as the nightingale.

7. The faustus, or white-wreathed shrike, is about the size of a common thrush. Its bill is pale: the upper parts of the body are grey; the under ferruginous: from the eyes to the hind head there passes a whitish line, composed of numerous white feathers, rendering it truly characteristic: the wings are rounded; the quills brownish, with grey edges, which are crossed with numerous slender brown lines: the tail is rounded, brown, and crossed with numerous bars of darker brown: the legs are pale. This elegant species inhabits China, where it is known by the name of *whom-*

*maj*. It may be observed, among others, in Chinese paper-hangings, where the white line seems to encompass the back part of the head like a wreath.

8. The Dominican shrike (or *Pie-grieffbe Dominiquaine* of Sonnerat), is bigger than a sparrow, and rather longer. The bill is greyish, conical, and strong; the base beset with bristles, pointing forwards: the head, neck, breast, back, wings, and tail, are black; the belly and rump white: the wings reach near an inch beyond the middle of the tail: the thighs are black. It inhabits the Philippine islands, and is a bold courageous bird; it flies very quick, and with great rapidity; frequently hovering in the air like a swallow. It is a great enemy to the raven; and to whom, though much bigger, he bids defiance, and even provokes him to combat: the battle often lasts half an hour, and ends with the retreat of the raven; rather, perhaps, from being teased out than much injured by the little enemy.

9. The nengeta (*Guirarou*, Buff.) is in length nine or ten inches. Its bill is dusky, and beset with bristles at the base: the irides are sapphire-coloured; and from the angles of the mouth, through the eyes, there runs a black streak: the upper parts of the body are of a dark brownish ash-colour; the under parts cinereous white: in the middle of the wing are a few white feathers: the quills and tail are nearly black; and all the feathers of the last, except the two middle ones, are obliquely tipped with white: the legs are of a dark ash colour; the claws black.—These birds are found at Surinam and Brasil. They are common likewise at Guiana, where they frequent watery places, and are found in great numbers together. They are observed, at frequent intervals, to set up a great cry all together; which affords a happy and certain presage to the thirsty traveller, in the immense forests of Guiana, of water being at hand.

10. The tyrannus, or tyrant shrike, is about the size of a thrush. Its bill is a blackish brown, beset with bristles at the base: the irides are brown: the upper parts of the plumage grey brown; the under, white: the breast inclines to ash-colour: the head is blackish on the upper part; the base of the feathers on that part in the male is orange, but seldom visible except it erects the feathers, when there appears a streak of orange down the middle of the crown: the tail is brown, margined with rufous: the legs and claws are black brown. The female scarcely differs, except in the head; the base of the crown feathers being yellow instead of orange; the colours are not quite so deep, and it is a trifle less in size. It inhabits Virginia.—There is a variety which inhabits St Domingo and Jamaica. These birds are called *titiri*, *pipiri*, or *quiquiri*, from their cry, which resembles those words. The first is called the *black-headed* or *great-billed pipiri*; the second, the *yellow-headed pipiri* or *pipiri of passage*. The first though in plenty are seldom seen but in pairs; the second in great troops, about the month of August, when they are very fat, and killed in great numbers for the table, as their flesh is accounted good eating.—All authors agree in the manners of these birds, which are ferocious to a great degree while the hen is sitting: no bird whatever dare approach their nest: they will attack the first which comes near, without reserve, and usually come off conquerors. From hence by some they are called *king-birds*.

Lanius  
||  
Lansquinet

The *Carolina tyrant* of Catesby is little, if at all, different from the preceding, in regard to specific character. But he says that it makes its nest rather exposed, on trees and bushes, frequently on the *sassafras*; whereas the *pipiris* make use of the hole of a tree, for the sake of concealing it. In *Carolina* it is a bird of passage, coming in spring, and making one nest in a year, which is commonly in June, and after bringing up its young, retires in autumn. These birds frequent also the red cedars; are seldom found in woods, but often in hedge rows and fences of fields, and for the most part within 200 yards of each other. They do not molest their own species; but the moment either crow, or even eagle, appears, all within reach join forces, and begin the attack in all parts of his body at once, never desisting till they have driven him to a great distance.

11. The *albus*, or white *Panayan shrike*, is about double the size of a lark. Its bill is black: the head, neck, back, belly, and shoulders, are white: the rest of the wings and tail black; and across the greater quills there is a white band: the legs are black. It inhabits the ile of *Panay*.

There are above 40 other species of this genus, besides many varieties.

LANNER, or LANNAR. See FALCO.

LANSDOWNE (Lord). See GRANVILLE.

LANSQUINET, the name of a game at cards, of French origin.

It may be played at by any indiscriminate number of people, though a single pack of cards is used during the deal. The dealer, who possesses an advantage, shuffles the cards, and after they have been cut by another of the party, deals out two cards on his left hand, turning them up, then one for himself, and a fourth that he places on the table for the company, who is called the *rejoissance*. On this card any, or all the company, the dealer excepted, may put their money, which the dealer is compelled to answer. The dealer continues turning the cards upwards, one by one, till two of a sort come up, that is to say, two aces, two deuces, &c. which, to prevent mistakes, or their being considered as single cards, he places on each side of his own card; and as often as two, three, or the fourth sort of a card come up, he invariably places, as before mentioned, on each side of his own card. The company has a right to take and put money upon any single card, unless the dealer's card should happen to be double, which is often the case, by his card being the same as one of the two hand-cards, which he first dealt out on his left hand: thus he continues dealing till he brings either their cards or his own. Whilst the dealer's own card remains undrawn, he wins; and which ever card is turned up first, loses. If he deals out the two cards on his left hand, which are styled the *hand cards*, before his own, he is intitled to deal again. This advantage amounts to no more than his being exempted from losing, when he turns up a similar card to his own, immediately after he has turned up one for himself.

*Lansquinet* is often played without the *rejoissance*, the dealer giving every one of the party a card to put their money upon. It is also often played by dealing only two cards, one for the company and the other for the dealer.

It should likewise be observed, that a limitation is

generally fixed for the sum to be placed upon any card or number of cards, either in gold or silver, beyond which the dealer is not obliged to answer.

LANTANA, or INDIAN SAGE, in botany: A genus of the *angiosperma* order, belonging to the *didynamia* class of plants; and in the natural method ranking under the 40th order, *Perfonate*. The calyx is indistinctly quadridentated; the stigma as it were broken and turned back like a hoof; the fruit is a plum with a bilocular kernel. There are several species, consisting of shrubby exotics from Africa and America for the green-house or stove; growing to the height of a yard or two, and adorned with oblong, oval, and roundish simple leaves, with monopetalous, tubular, four-parted flowers of different colours. They may be propagated either by seeds or cuttings.—The *camara*, or wild sage, is remarkable for the beauty of its flowers; which are yellow, tinged with red. The *involutrata*, or sea-side sage, has small ash coloured leaves and a most agreeable smell. They are both natives of the West Indies, the former growing wild among the bushes, and the latter found near the sea. Their leaves, particularly those of the sea-side sage, are used by the black people in teas for colds, rheums, and weakness of the stomach.—There are seven other species.

LANTERN, or LANTHORN, a device to carry a candle in; being a kind of cover usually made of white iron, with shades of some transparent matter, as glass, horn, &c. to transmit the light.

*Dark LANTERN*, one with only one opening, which may also be closed up when the light is to be entirely hid, or opened when there is occasion for the assistance of the light to discover some object.

*Magic LANTERN*, an optic machine, whereby little painted images are represented so much magnified, as to be accounted the effect of magic by the ignorant. See DIOPTRICS, Art. x. p. 37.

LANTERN, in architecture, a little dome raised over the roof of a building to give light, and serve as a crowning to the fabric.

The term *lantern* is also used for a square cage of carpentry, placed over the ridge of a corridor or gallery, between two rows of shops, to illumine them, like that of the royal exchange London.

LANTERN, on ship-board, a well known machine, of which there are many in a ship, particularly for the purpose of directing the course of other ships in a fleet or convoy; such are the poop and top lanterns, &c.

*Feast of LANTERNS*, in China, is a celebrated feast held on the 15th day of the first month; so called from the infinite number of lanterns hung out of the houses and streets; which, it is said, is no less than two hundred millions. On this day are exposed lanterns of all prices, whereof some are said to cost 2000 crowns. Some of their grandees retrench somewhat every day out of their table, out of their dress, equipage, &c. to appear the more magnificent in lanterns. They are adorned with gilding, sculpture, painting, japanning, &c. And as to their size, it is extravagant; some being from 25 to 30 feet diameter: they represent halls and chambers, and two or three such machines together would make handsome houses; so that in China they are able to eat, lodge, receive visits, have balls, and act plays in a lantern. To illumine them, they should have bonfires; but as that would be inconvenient, they content themselves with lighting

Lantern  
Lantern

*Antiguan Shrike.*

*Dominican Sh.*

*Yucatec Sh.*

lighting up in them an infinite number of torches or lamps, which at a distance have a beautiful effect. In these they exhibit various kinds of shows, to divert the people. Besides these enormous lanterns, there is a multitude of others smaller, which usually consist of six faces or lights, each about four feet high, and one and a half broad, framed in wood finely gilt and adorned; over these they stretch a fine transparent silk, curiously painted with flowers, trees, and sometimes human figures: the painting is very extraordinary, and the colours extremely bright; and when the torches are lighted, they appear highly beautiful and surprising.

*LANTERN Fly*, in natural history. See FULGORA.

LANUGO, the soft down of plants, like that growing on the fruit of the peach tree. See HAIR.

LAOCOON (fab. hid.), a son of Priam and Hecuba, or according to others of Antenor or of Capys. As being priest of Apollo, he was commissioned by the Trojans to offer a bullock to Neptune to render him propitious. During the sacrifice two enormous serpents issued from the sea, and attacked Laocoon's two sons who stood next to the altar. The father immediately attempted to defend his sons; but the serpents falling upon him squeezed him in their complicated wreaths, and he died in the greatest agonies. This punishment was said to have been inflicted upon him for dissuading the Trojans to bring into the city the fatal wooden horse which the Greeks had consecrated to Minerva, as also for his impiety in hurling a javelin against the sides of the horse as it entered within the walls. According to Hyginus, he suffered the above punishment for his marriage against the consent of Apollo, or, according to others, for his polluting the temple, by his commerce with his wife Antiope, before the statue of the god.

LAOCOON, in the history of the arts, is a celebrated monument of Greek sculpture executed in marble by Polydorus, Athenodorus, and Agesander, the three famous artists of Rhodes. This remain of antiquity was found at Rome in the ruins of the palace of Titus, in the beginning of the sixteenth century, under the pontificate of Julius II. and since deposited in the Farnese palace. Laocoon, the priest of Apollo and Neptune, is here represented with his two sons, with two hideous serpents clinging round his body, gnawing it, and injecting their poison: Virgil has given us the following description of the fact:

*Serpens amplexus uterque*

*Implicat, & miseris morsu depascitur artus:*

*Corr' piunt, spirisque ligant ingentibus, & jam*

*Bis medium amplexi, his collo squamea circum*

*Terga dati, superant capite & ceruicibus altis.*

This statue exhibits the most astonishing dignity and tranquillity of mind in the midst of the most excruciating torments: Pliny \* says of it, that is, *opus omnium, picturee & statuarie artis, præferendum.*

The Laocoon, Dr Gillies † observes, may be regarded as the triumph of Grecian sculpture; since bodily pain, the grossest and most ungovernable of all our passions, and that pain united with anguish and torture of mind, are yet expressed with such propriety and dignity, as afford lessons of fortitude superior to any taught in the schools of philosophy. The horrible shriek which Virgil's Laocoon emits is a proper circumstance for poetry, which speaks to the fancy by

images and ideas borrowed from all the senses, and has a thousand ways of ennobling its object; but the expression of this shriek would have totally degraded the statue. It is softened, therefore, into a patient sigh, with eyes turned to heaven in search of relief. The intolerable agony of suffering nature is represented in the lower part, and particularly in the extremities of the body; but the manly breast struggles against calamity. The contention is still more plainly perceived in his furrowed forehead; and his languishing paternal eye demands assistance, less for himself than for his miserable children, who look up to him for help.

LAODICÆA on the Lycus (anc. geog.), a town of Phrygia, at first called *Diospolis*, then *Rhœas*. It was built by Antiochus son of Stratonice, and called after his consort *Laodice*. It was long an inconsiderable place; but increased toward the age of Augustus Cæsar, after having suffered in a siege from Mithridates. The fertility of the soil, and the good fortune of some of its citizens, raised it to greatness. Hiero, who adorned it with many offerings, left the people his heir to more than 2000 talents. After that benefactor followed Zeno, the rhetorician; and his son Polemo, as renowned a sophist as ever lived. This person flourished at Smyrna; but was buried here by the Syrian gate, near which were the sepulchres or coffins of his ancestors. Laodicea, though inland, grew more potent than the cities on the coast, and became one of the largest towns in Phrygia. It was often damaged by earthquakes, and restored by its own opulence or by the munificence of the Roman emperors. These resources failed, and the city, it is probable, became early a scene of ruin. About the year 1097 it was possessed by the Turks, and submitted to Ducas general of the Emperor Alexis. In 1120 the Turks sacked some of the cities of Phrygia by the Mæander, but were defeated by the Emperor John Comnenus, who took Laodicea, and built anew or repaired the walls. About 1161 it was again unfortified. Many of the inhabitants were then killed with their bishop, or carried with their cattle into captivity by the Turks. In 1190 the German emperor, Frederick Barbarossa, going by Laodicea with his army toward Syria on a crusade, was received so kindly, that he prayed on his knees for the prosperity of the people. About 1196 this region with Caria was dreadfully ravaged by the Turks. The Sultan, on the invasion of the Tartars in 1255, gave Laodicea to the Romans; but they were unable to defend it, and it soon returned to the Turks. It is now totally ruined and deserted. Several remains of its ancient grandeur are, however, still to be seen; particularly the ruins of two theatres and an amphitheatre.—The memory of this place is consecrated in scripture, being one of the seven churches to which St John in the Apocalypse addresses himself, commended by St Paul.

LAODICÆA on the sea (anc. geog.), according to Strabo, was a town of Seleucis in Syria, extremely well built, with a commodious harbour. The country about it yielded great quantities of wine. The city took its name from *Laodice*, mother of Seleucus the founder of it.

LAOMEDON, king of Troy, whose history is involved in fables. He was son of Ilius king of Troy; and married Strymo, called by some *Placia*, or *Leu-*

Laodicea,  
Laomedon.

Chandler's  
Asia.

**Laomedon** *Leucippe*, by whom he had Podarces afterwards known by the name of *Priam*, and *Hesione*. He built the walls of Troy, and was assisted by Apollo and Neptune, whom Jupiter had banished from heaven, and condemned to be subservient to the will of Laomedon for one year. When the walls were finished, Laomedon refused to reward the labours of the gods; and soon after his territories were laid waste by the sea or Neptune, and his subjects were visited by a pestilence sent by Apollo. Sacrifices were offered to the offended divinities; but the calamities of the Trojans increased, and nothing could appease the gods, according to the words of the oracle, but annually to expose to a sea monster a Trojan virgin. Whenever the monster appeared, the marriageable maidens were assembled, and the lot decided which of them was doomed to death for the good of her country. When this calamity had continued for five or six years, the lot fell upon *Hesione* Laomedon's daughter. The king was unwilling to part with a daughter whom he loved with uncommon tenderness, but his refusal would irritate more strongly the wrath of the gods. In the midst of his fear and hesitation, *Hercules* came and offered to deliver the Trojans from this public calamity, if Laomedon would promise to reward him with a number of fine horses. The king consented; but when the monster was destroyed, he refused to fulfil his engagements, and *Hercules* was obliged to besiege Troy and take it by force of arms. Laomedon was put to death after a reign of 29 years; his daughter *Hesione* was given in marriage to *Telamon*, one of the conqueror's attendants; and *Podarces* was ransomed by the Trojans, and placed upon his father's throne. According to *Hyginus*, the wrath of Neptune and Apollo was kindled against Laomedon, because he refused to offer on their altars as a sacrifice all the first born of his cattle, according to a vow he had made.

**LAON**, a considerable town of the isle of France, and capital of the *Laonis*, with a castle and bishop's see. Its principal trade consists in corn and wine; and it is very advantageously seated on a mountain in E. Long. 3. 42. N. Lat. 49. 34.

**LAOS**, a kingdom of Asia beyond the Ganges; bounded on the north, by China; on the east, by *Tonquin* and *Cochin-China*; on the south, by *Cambodia*; and on the west, by the kingdom of *Siam*, and by the territories of the king of *Ava*. This country is full of forests, and abounds in rice, fruits, and fish. The inhabitants are well made, robust, of an olive complexion, and mild in their disposition; but very superstitious, and much addicted to women. Their principal occupation is tilling the ground and fishing. The king shows himself but twice a year, and has large revenues from the elephant's teeth found in his dominions. Their religion is a kind of idolatry, and much the same as in China. *Langiona* is the capital town.

**LAPATHUS**, **LAPETHUS**, or *Lepithus* (anc. geog.); a town of Cyprus, about the middle of its north side, with a port or station for ships, and a cognominal river. It was built by a colony of Phœnicians, according to *Scylax*; by *Belus* king of Tyre, according to *Alexander Ephesius*. According to *Strabo*, it was built by a colony of Spartans; and one of the nine kings resided here, the last of whom was *Pisistratus*,

who commanded the naval army of Alexander the Great. There was a temple here dedicated to *Venus*. The territory round it is called *Lapithia* by *Diodorus* and *Ptolemy*; *Lapithii*, the people, tainted with a degree of fatuity; hence *Lapathius* denotes *fatuus*, (*Hesychius*).—Now a village called *Lapitha*; but, according to the *Abbe Mariti*, the longest and most extensive in the island. Besides the advantage of a fine situation, it furnishes the best productions in the country; and though Cyprus is in general not very abundant in fruits, *Lapitha* seems a favoured spot in this respect, and may be called the garden of the island.

**LAPIDARY**, an artificer, who cuts precious stones.

The art of cutting precious stones is of great antiquity. The French have carried this art to a very great perfection, but not in any degree superior to the British.

There are various machines employed in the cutting of precious stones according to their quality. The diamond, which is extremely hard, is cut on a wheel of soft steel, turned by a mill, with diamond dust, tempered with olive-oil, which also serves to polish it.

The oriental ruby, sapphire, and topaz, are cut on a copper-wheel with diamond dust tempered with olive-oil, and are polished on another copper-wheel with tripoli and water. The hyacinth, emerald, amethyst, garnets, agates, and other stones not of an equal degree of hardness with the other, are cut on a leaden wheel with flint and water, and polished on a tin-wheel with tripoli. The turquois of the old and new rock, girasol, and opal, are cut and polished on a wooden wheel with tripoli also.

The lapidaries of Paris have been a corporation since the year 1290. It is governed by four jurats, who superintend their rights and privileges, visit the master-workmen, take care of the matter-piece of workmanship, bind apprentices, and administer the freedom.

**LAPIDARY** is also used for a virtuoso skilled in the nature, kinds, &c. of precious stones; or a merchant who deals in them.

**LAPIDARY Style**, denotes the style proper for monumental or other inscriptions.

This is a kind of medium between prose and verse; the jejune and the brilliant are here equally to be avoided. *Cicero* has prescribed the rules of it: *Accedat oportet oratio varia, vehemens, plena spiritus. Omnium sententiarum gravitate, omnium verborum ponderibus, est utendum.*

The lapidary style, which was lost with the ancient monuments, has been retrieved at the beginning of this age by *Count Emanuel Teforo*: it is now used various ways at the beginning of books; and even epistles dedicatory are composed in it, of which we have no example among the ancients.

**LAPIDESCENT**, any thing which has the faculty of petrifying, or turning bodies to a stony nature. Naturalists speak of a lapidescent principle, a lapidescent spirit, a lapidescent juice, &c.

**LAPIS**, in general, is used to denote a stone of any kind.

**LAPIS**, in Roman antiquity, a geographical measure denoting a mile; because miles were distinguished by erecting a stone at the end of each; from the number

number marked on which, the length of way from Rome might be known. The device is by Plutarch ascribed to Caius Gracchus. This was more accurately executed by Augustus, who erected a gilt pillar in the forum, at which all the public ways of Italy, distinguished by stones, were terminated. The same thing was done in the Roman provinces. Hence the phrases *tertius lapis*, *centesimus lapis*, &c. for three, a hundred, &c. miles; and sometimes the ordinal number without *lapis*, as *ad duodecimum*, &c. at twelve miles distance.

*Lapis Affius*, in the natural history of the ancients, the name of a stone called also *sarcophagus*, from its power of consuming flesh. See *SARCOFAGUS*.

*Lapis Bononiensis*, the Bolognian stone. See *CHEMISTRY*, n<sup>o</sup> 1081, 1082.

*Lapis Lazuli*. See *LAZULI*.

*Lapis Lyncurinus*. See *LYNCURIUS*.

*Lapis Mutabilis*. See *HYDROPHANES*.

*Lapis Hepaticus*. See *LIVER-STONE*.

*Lapis Lydius*. See *TOUCH-STONE*, *TRAPP*, and *Lapis LYDIUS*.

*Lapis Obsidianus*. See *OBSIDIANUS* and *GALLINACEUS*.

*Lapis Nephriticus*. See *JADE-STONE*.

*Lapis Specularis*. See *SPECULARIS*.

*LAPITHÆ*, (anc. geog.) a people of Thessaly. See the next article.

*LAPITHUS*, (fab. hist.), a son of Apollo, by Stilbe. He was brother to Centaurus; and married Orsinome, daughter of Euronymus, by whom he had Phorbas and Periphas. The name of Lapithæ was given to the numerous children of Phorbas and Periphas, or rather to the inhabitants of the country of which they had obtained the sovereignty. The chief of the Lapithæ assembled to celebrate the nuptials of Perithous, one of their number. Among them were Theseus, Dryas, Hoplesus, Mopfus, Phalerus, Exadius, Prolochus, Titareus, &c. The Centaurs were also invited to partake the common festivity; and the amusements would have been harmless and innocent, had not one of the intoxicated Centaurs offered violence to Hippodamia the wife of Perithous. The Lapithæ repented the injury, and the Centaurs supported their companions; upon which the quarrel became universal, and ended in blows and slaughter. Many of the Centaurs were slain, and they at last were obliged to retire. Theseus among the Lapithæ showed himself brave and intrepid in supporting the cause of his friends; and Nestor also was not less active in the protection of chastity and innocence. Hesiod has described the battle of the Centaurs and Lapithæ; as has also Ovid, in a more copious manner. The invention of bits and bridles for horses is attributed to the Lapithæ.

**LAPLAND**, the most northerly country of Europe, extending from the north cape in 71° 30' N. Lat. to the White Sea under the arctic circle, is inhabited by the same people, though the country is subject to different powers. Norwegian Lapland, under the dominion of Denmark, lies between the northern sea, the river Pais, and the lake Enarak. Swedish Lapland comprehends all the country from the Baltic to the mountains that separate Norway from Sweden. It is divided into six districts, denominated *mark* or territory; and these are distinguished by the

names of rivers, such as Aungnermanland, Elma, Peta, Luku, Torna, and Kiumi. The eastern part, subject to the Czar of Muscovy, situated between the lake Enarak and the White Sea, is divided into three distinct prefectures; namely, that of the sea coast towards the north, called *Mourmankoi Leporie*; the Terskoi Leporie, upon the coast of the White Sea; and the third, or inland, known by the name of *Beliannoreskoi Leporie*. In Swedish Lapland, which is the most considerable of the three, the provinces or marks are subdivided into smaller districts called *biars*, consisting each of a certain number of families; among which the land is parcelled out by government, or the prefect of the district appointed by the king of Sweden.

Lapland may be termed a huge congeries of frightful rocks and stupendous mountains; interspersed, however, with many pleasant valleys, watered by an infinite number of rivulets that run into the rivers and lakes, which discharge themselves into the gulf of Bothnia. The names of the principal lakes in Lapland are the Great Uma, the Great Windel, the Oreavan, the Stor-avan, the Great Lula; the lakes of Kartom, Kali, Torno, Enara, and Kiumi. Some of these extend 60 leagues in length, and contain a great number of islands: Stor-avan is said to contain 365; and Enara contains an archipelago of islands so large, that no Laplander has lived long enough to visit each particular island. The natives believe this country to be the terrestrial paradise; and indeed nothing could be more enchanting than such vast prospects of mountains, hills, forests, lakes, rivers, &c. if the country was in a moderate climate; though even here, in summer the roses are seen blowing wild on the banks of the lakes and rivers, with all the beautiful glow of colour which appears in those cultivated in our gardens. But all the intervals between the mountains are not ingrossed by these agreeable prospects; great part of the flat country is covered with brown dusky forests of fir and pine trees; and these are often skirted by wide extended morasses, the stagnating waters of which in summer produce myriads of mischievous insects, that are more intolerable than even the cold of winter.

The cold of Lapland is very intense during the winter, freezing even brandy and the watery part of spirit of wine, if the latter is not highly rectified: all the lakes and rivers are frozen to a prodigious thickness; and the whole face of the country is covered with snow to the depth of four or five feet. While this continues loose, it is impossible to travel; for a man's eyes are not only blinded with it, but if a strong wind should rise he will be buried in the drifts of snow: yet should a partial thaw take place for a few hours, the surface of this snow is formed by the succeeding frost into a hard impenetrable crust, over which the Laplander travels in his sledge with great celerity. While the thaw prevails, the air is surcharged with vapours, and the climate is rainy; but while the north wind blows, the sky is beautifully serene, and the air very clear.

The heat of summer is almost as intolerable in Lapland as the cold of winter. At the northern extremity of the country the sun never sets for three months in summer, and in winter there is an uninterrupted night of the same duration; but this is qualified in such a manner by a constant revolution of dawn and twilight, by a serene sky, moon-light, and aurora bore-

Lapland. lis, reflected from the white surface of the earth covered with snow, that the inhabitants are enabled to hunt, fish, and proceed with their ordinary occupations. The country abounds with excellent springs; and is remarkable for some surprising cataracts, in which the water rumbles over frightful precipices, and dashes among rocks with amazing impetuosity and noise.

The soil of Lapland is generally so chilled and barren, that it produces little or no grain or fruit-trees of any kind. This sterility, however, is not so much owing to the soil, which is in many places of a rich mould, as to want of industry; for in some districts the Swedes have tilled and manured pieces of ground that bear plentiful crops of rye. There is also great plenty of berries: such as black currants; what is called the Norwegian mulberry, growing upon a creeping plant, and much esteemed as an antiscorbutic; rasp-berries, cran-berries, juniper berries, and bilberries. The tops of the mountains are so much exposed to intense cold, and tempests of snow and hail, that no tree will grow near the summit; but in parts that are more sheltered, we see fine woods of birch, pine, and fir, disposed by nature as if they had been planted by art in rows at regular distances, without any undergrowth or incumbrance below. Besides these trees, some parts of Lapland produce the service tree, the willow, the poplar, the elder, and the cornel. Among the plants of this country the principal is the angelica; which is greatly esteemed by the natives, who use it in their food. Here is likewise the acetosa or sorrel, which grows in great plenty, and is of much service on account of its antiscorbutic properties. They have also other kinds of herbs peculiar to the country, different kinds of grass, heath, fern, and moss; which are all enumerated by Linnæus in his *Flora Laponica*. But the vegetable which is in greatest plenty, and of the most extensive use among them, is the *lichen rangiferus*. The rein-deer is wholly sustained in winter by this vegetable; and the Laplanders themselves boil it in broth as a cordial and restorative. They likewise use one sort of it as a soft, easy, and wholesome bed for their newborn children.

Some silver and lead mines have been discovered in the provinces of Pitha and Lula; and two of copper, together with excellent veins of iron, in the district of Torno; but they are not at present worked with any considerable advantage. In some places there are veins of silver and gold mixed; but these mines are worked only for a few months in the summer, because the frost hinders the engines from playing. Here are found beautiful crystals, of a surprising magnitude, so hard and fine, that when polished they resemble real diamonds. In some places amethysts and topazes are also found, but pale and cloudy; also a great quantity of very curious stones, which are too hard to be worked by the tool of the mason. Some of these found on the banks of rivers and lakes, when they happen to bear the least resemblance to the figures of animals, the Laplanders remove to more conspicuous places, and adore as deities. The province of Torno affords some curious stones of an octagonal shape, regular, shining, and polished by the hand of nature. In some rivers they fish for pearls, which are generally pale; but some of them are as bright as the oriental pearls

and much larger and rounder. These pearls are found in muscle-shells; and the fishery is not in the sea, but in rivers.

Lapland, as well as Norway, is infested with a great number of grey wolves and bears, with whom the inhabitants wage perpetual war. The most honourable exploit among the Laplanders is that of killing a bear; and the heroes adorn their caps with a small plate of lead or pewter for every bear they have slain. The country abounds also with elks, beavers, and otters, which live here unmolested, and find plenty of fish for their subsistence. The forests of this country furnish haunts to a great number of beautiful martens and squirrels; which last change their colour every winter from brown to grey. Lapland is also the native country of the zibeling or sable, whose skin is extremely valuable. Here are likewise ermines, weasels, hares, large black cats which attend the Laplanders in hunting, and little prick-eared curs trained to the game. But the most remarkable animal of Lapland is the rein-deer, of which an account is given in the article CERVUS n<sup>o</sup> 4. These animals, so useful in various respects to the natives, are kept at no expence. In summer they feed upon grasses and alpine plants; in winter, as already mentioned, upon the *lichen rangiferus*, or rein-deer lichen, and its varieties, which are so abundant as in many parts almost totally to cover the ground for the space of several miles, and which the sagacious animal discovers under the snow by the peculiar acuteness of its smell. Most of those used for draught are castrated when very young, and are larger and fatter than the bucks. The woods, mountains, and rivers are well stocked with wild-fowl; such as bullard, partridge, grouse, heathcock, pheasants, lapwings, swans, wild-geese, wild-ducks, and all sorts of aquatic birds that build and breed in northern climates. In the beginning of the spring the swans go thither in numerous flocks from the German ocean; the lap-wings follow in such swarms that they darken the sky as they pass along, and scream so loud that they may be heard at a great distance. The rocks and mountains are likewise frequented by eagles, hawks, falcons, kites, and other birds of prey.—The rivers abound with delicious salmon from the gulph of Bothnia, trout, bream, and perch of exquisite flavour and amazing magnitude; and the inhabitants of Wardhus, or Danish Lapland, are well supplied with fish from the northern ocean.—With respect to insects, the flies hatched in the morasses and woods in summer are so numerous, that they often obscure the face of day; so venomous, troublesome, and intolerable, that the rein-deer fly to the tops of the highest mountains for shelter, and the Laplanders betake themselves to the sea-side, which is the least infested by these pestilent vermin. M. de Maupertuis, in his account of the voyage he made to Lapland, in company with the other French mathematicians sent thither by the king to measure a degree of the meridian, gives us to understand, that on the tops of the mountains in Torno the flies were so troublesome, that even the Finland soldiers, who are counted the most hardy troops in the service of Sweden, were obliged to cover their faces with the skirts of their coats from the attacks of these animals, which swarmed to such a degree, that the moment a piece of flesh appeared it was blackened all

and over. Some of these flies are very large, with green heads, and fetch blood from the skin wherever they strike. The Laplanders shroud themselves in the smoke of a large fire kindled for that purpose; yet even this disagreeable expedient was not sufficient to defend the French philosophers: they were obliged, notwithstanding the excessive heat, to wrap up their heads in garments made of the skins of rein-deer, called in that country *lapmudes*, and to cover themselves with a thick rampart of fir-boughs; yet all these precautions proved ineffectual. M. de Maupertuis observed a lake quite covered with little yellowish grains, resembling millet seed, which he supposed to be the chrysalises of some of these insects.

The Laplanders are very low in stature, and are likewise remarkable for having large heads. They are also ill shaped, and their features harsh. They are, however, strong, hardy, and robust, inasmuch that they will bear incredible fatigue; and it is remarked that the stoutest Norwegian is not able to bend the bow of a Laplander. The women are much less homely than the men, and many of them are noted for a delicate and florid complexion.

These people are simple, honest, hospitable, and timorous: their timidity, however, respects war alone; for to many other species of dangers they expose themselves with surprising intrepidity, whether in ascending and descending mountains and precipices with their snow-shoes and in sledges, or in venturing amidst whirlpools and cataracts in little slender boats made of thin fir-boards, fastened together with thongs of leather, sinews of wild-beasts, or tough and flexible twigs of willow and osier. These boats are of different sizes, from two to six yards in length, managed with oars, and caulked with moss so tight as to keep out the water. The Laplanders are partly settled, and in part wild and roving: the latter live in tents made with coarse cloth; the former are fixed in small villages near the lakes, and chiefly follow fishing. They build their cottages somewhat in the shape of a cone, by placing a circle of large trees or poles assant in the earth, and close to each other, so that their tops meet, and form a small vent for the issue of the smoke: they cover the ground within with branches of trees. In spring their food consists principally of the eggs of water-fowl, which are extremely plentiful in those parts; in summer and autumn, of the birds themselves, and of various other of the partridge-tribe; and in winter of the milk and flesh of the rein deer and dried fish. They had till lately no bread; but in lieu thereof used the inner rind of the pine-tree dried and ground, and dried fish reduced to powder. They make confections and decoctions of berries, angelica, and sorrel, which they justly reckon to be preservatives against the scurvy. The Laplander is secured in the possession of uninterrupted health by temperance and exercise, which, together with the severity of the climate, brace his nerves to a very unusual pitch of strength, and fortify his constitution in such a manner, that he often lives to the age of 100, without feeling the least pang of distemper, or even perceiving his vigour in the least impaired; for it is not uncommon to see a Laplander in extreme old age hunting, fowling, skating, and performing all the severest exercises with undiminished agility.

VOL. IX. Part. II.

The summer garb of the men consists of a long coat of coarse cloth, reaching down the middle of the leg, and girded round the waist with a belt or girdle; from which hang a Norway knife, and a pouch containing flints, matches, tobacco, and other necessaries; the girdle itself being decorated with brass rings and chains. Their caps are made of the skin of the northern diver, with the feathers on; and their shoes of the rein-deer skin, with the hair outwards. They wear no linen; but the garments of the better sort are of a finer cloth, and they delight in a variety of colours, though red, as the most glaring, is the most agreeable. In winter they are totally cased up in coats, caps, boots, and gloves, made of the rein-deer skins. In the *Flora Lapponica*, Linnæus says, "Perhaps the curious reader will wonder how the people in Lapland, during the terrible cold that reigns there in winter, can preserve their lives; since almost all birds, and even some wild beasts, desert it at that time. The Laplander, not only in the day, but through the whole winter nights, is obliged to wander about in the woods with his herds of rein-deer. For the rein-deer never come under cover, nor eat any kind of fodder, but a particular kind of liverwort. On this account the herdsmen are under a necessity of living continually in the woods, in order to take care of their cattle, lest they should be devoured by wild beasts. The Laplander easily does without more light, as the snow reflects the rays that come from the stars, and as the *Aurora Borealis* illuminates the air every night with a great variety of figures. No part of our body is more easily destroyed by cold than the extremities of the limbs, which are most remote from the sun of this microcosm, the heart. The kibes that happen to our hands and feet, so common in the northern parts of Sweden, prove this. In Lapland you will never see such a thing; although were we to judge by the situation of the country, we should imagine just the contrary, especially as the people wear no stockings, as we do, not only single, but double and triple. The Laplander guards himself against the cold in the following manner. He wears breeches made of rein-deer skins with the hair on, reaching down to his heels, and shoes made of the same materials, the hairy part turned outwards. He puts into his shoes slender-eared broad-leaved cyperus grass, (*carex vesicaria*, *Spec. Pl.* or the Bladder *Carex*), that is cut in summer and dried. This he first combs and rubs in his hands, and then places it in such a manner that it not only covers his feet quite round, but his legs also; and being thus guarded, he is quite secured against the intense cold. With this grass they stuff their gloves likewise, in order to preserve their hands. As this grass keeps off the cold in winter, so in summer it hinders the feet from sweating, and at the same time preserves them from being annoyed by striking against stones, &c. for their shoes are very thin, being made, not of tanned leather, but the raw hide."

The womens apparel differs very little from that of the other sex; only their girdles are more ornamented with rings, chains, needle-cases, and toys that sometimes weigh 20 pounds. In winter, both men and women lie in their furs; in summer, they cover themselves entirely with coarse blankets to defend them from the gnats which are intolerable. The Laplanders

Lapland.

are not only well disposed, but naturally ingenious. They make all their own furniture, their boats, sledges, bows and arrows. They form neat boxes of thin birch boards, and inlay them with the horn of the rein-deer. The Swedes are very fond of the Lapland baskets made of the roots of trees, slit in long thin pieces, and twisted together so nicely that they will hold water. Among the manufactures of this country we likewise number curious horn-spoons, and moulds in which they cast the trinkets of tin which adorn their girdles. Over and above these domestic occupations, the men within doors perform the office of cooks in dressing victuals for the family. The women act as tailors and embroiderers; they make clothes, shoes, and boots, and harness for the rein deer: they spin thread of fur, and knit it into caps and gloves that are very soft and warm. They draw tin into wire through a horn; and with this they cover the thread which they use in embroidering the figures of beasts, flowers, trees, and stars upon their caps and girdles.

The Laplanders make surprising excursions upon the snow in their hunting expeditions. They provide themselves each with a pair of skates, or snow-shoes, which are no other than fir-boards covered with the rough skin of the rein-deer, turned in such a manner that the hair rises against the snow, otherwise they would be too slippery. One of these shoes is usually as long as the person who wears it; the other is about a foot shorter. The feet stand in the middle, and to them the shoes are fastened by thongs or withes. The Laplander thus equipped wields a long pole in his hand, near the end of which there is a round ball of wood to prevent its piercing too deep in the snow; and with this he stops himself occasionally. By means of these accoutrements he will travel at the rate of 60 miles a-day without being fatigued; ascending steep mountains, and sliding down again with amazing swiftness.

The Laplander not only travels a-foot, but is provided with a carriage drawn by the rein-deer, in which he journeys with still greater rapidity. The sledge, called *pulka*, is made in the form of a small boat, with a convex bottom, that it may slide the more easily over the snow: the prow is sharp and pointed; but the sledge is flat behind. The traveller is swathed in this carriage like an infant in a cradle, with a stick in his hand to steer the vessel, and disengage it from pieces of rock or stumps of trees that may chance to encounter it in the route. He must also balance the sledge with his body, otherwise he will be in danger of being overturned. The traces, by which this carriage is fastened to the rein-deer, are fixed to a collar about the animal's neck, and run down over the breast between the fore and hind legs, to be connected with the prow of the sledge: the reins, managed by the traveller, are tied to the horns; and the trappings are furnished with little bells, the sound of which is agreeable to the animal. With this draught at his tail, it has been reported that the rein-deer will fly like lightning over hill and dale at the rate of 200 miles a-day. But this representation is greatly exaggerated. According to the best accounts, the common pace of the rein-deer is only at the rate of about four miles an hour; though, if he be pressed, he will travel 10 or 12 Swedish miles (70 or 84 English miles) in a day; but by such hard

driving is generally destroyed. It, however, frequently happens, that he will persevere in his journey 50 miles without intermission, and without taking any refreshment, except occasionally moistening his mouth with the snow. Before he sets out, the Laplander whispers in his ear the way he is to follow, and the place at which he is to halt, firmly persuaded that the beast understands his meaning: but, in spite of this intimation, he frequently stops short long before he has reached the journey's end; and sometimes he overshoots the mark by several leagues. In the beginning of winter the Laplanders mark the most frequented roads, by strewing them with fir-boughs; and indeed these roads are no other than pathways made through the snow by the rein-deer and the pulkas; their being frequently covered with new snow, and alternately beaten by the carriage, consolidates them into a kind of causeway; which is the harder if the surface has felt a partial thaw, and been crufted by a subsequent frost. It requires great caution to follow these tracks; for if the carriage deviates to the right or left, the traveller is plunged into an abyss of snow. In less frequented parts, where there is no such beaten road, the Laplander directs his course by certain marks which he has made on the trees.

The chief occupation of the Laplanders is hunting, and this exercise they perform in various ways. In summer they hunt the wild beasts with small dogs, trained to the diversion. In winter they pursue them by their tracks upon the snow, skating with so great velocity, that they very often run down the prey. They catch ermines in traps, and sometimes with dogs. They kill squirrels, martens, and fables, with blunt darts, to avoid wounding the skin. Foxes and beavers are slain with sharp-pointed darts and arrows; in shooting which, they are accounted the best marksmen in the world. The larger beasts, such as bears, wolves, elks, and wild rein-deer, they either kill with firearms purchased in Sweden or Norway, or take in snares and pits dug in the forests. Their particular laws relating to the chase are observed with great punctuality. The beast becomes the property of the man in whose snare or pit he is caught; and he who discovers a bear's den has the exclusive privilege of hunting him to death. The conquest of a bear is the most honourable achievement that a Laplander can perform; and the flesh of this animal they account the greatest delicacy on earth. The bear is always dispatched with a fusil, sometimes laid as a snare, ready cocked and primed; but more frequently in the hands of the hunter, who runs the most imminent risk of his life should he miss his aim of wounding the beast mortally. The death of a bear is celebrated by the Laplanders as a signal victory. The carcase is drawn to the cabin or hut of the victor by a rein-deer, which is kept sacred from any other work for a whole year after this service. The bear is surrounded by a great number of men, women, and children, reciting a particular hymn or song of triumph, in which they thank the vanquished enemy for having allowed himself to be overcome without doing any mischief to his conqueror, and welcome his arrival: then they make an apostrophe to heaven, expressing their acknowledgment to God, that he has created beasts for the use of men, and endued mankind with strength and courage to overcome

and come and attack the fiercest of the brute creation. The hero is saluted by the women, who spit chewed elder-bark in his face. He is feasted three days successively, and his cap is decorated with an additional figure wrought in tin-wire.

The manner in which the young Laplander chooses a wife is equally remarkable and ludicrous. When he has pitched upon a female, he employs some friends as mediators with the father; and these being provided with some bottles of brandy, the suitor accompanies them to the hut of his future father-in-law, who invites the mediators to enter; but the lover is left without until the liquor be drank, and the proposal discussed: then he is called in, and entertained with such fare as the hut affords; yet without seeing his mistress, who retires and goes out on this occasion. Having obtained leave of her parents to make his addresses in person, he puts on his best apparel, and is admitted to the lady, whom he salutes with a kiss: then he presents her with the tongue of a rein-deer, a piece of beaver's flesh, or some other sort of provision. She declines the offer, which is made in presence of her sisters and relations; but makes a signal to the lover to follow her into the fields, where she accepts the presents. Thus encouraged, he begs her permission to sleep with her in the hut: if she consents, there is no further difficulty; if she disapproves of the proposal, she drops her presents on the ground. When the lovers are agreed, the youth is permitted to visit his inamorata as often as he shall think proper: but every time he comes, he must purchase this pleasure with a fresh bottle of brandy; a perquisite so agreeable to the father, that he often postpones the celebration of the nuptials for two or three years. At length the ceremony is performed at church by the priest of the parish. Even after this event, the husband is obliged to serve his father-in-law a whole year; at the expiration of which he retires to his own habitation with his wife, and her patrimony of rein-deer, and receives presents from all his friends and relations. From this period he sequellers his wife from the company of all strangers, especially of the male sex, and watches over her conduct with the most jealous vigilance.

Many Lapland women are barren, and none of them are very fruitful. A woman, immediately after delivery, swallows a draught of whale-fat: the child is washed with snow or cold water, and wrapped up in a hare-skin. The mother is seldom above five days in the straw, and in fourteen is generally quite recovered: then she carries the child to church to be baptized. Before she can reach the residence of the priest, she is often obliged to traverse large forests, mountains, lakes, and wide-extended wastes of snow. The infant is fastened in a hollowed piece of wood, stretched naked on a bed of fine moss, covered with the soft skin of a young rein-deer, and hung by two straps to the back of the mother, who always suckles her own child. At home this little cradle is hung to the roof of the hut, and the child lulled asleep by twinging it from one side to the other. The boys from their infancy practise the bow; and are not allowed to break their fast until they have hit the mark. The female children are as early initiated in the business peculiar to their sex.

These people, though for the most part vigorous

and healthy, are not altogether exempted from distemper. They are subject to sore eyes, and even to blindness, from the smoke of their huts, and the fire to which they are almost continually exposed. Some waste away in consumptions; others are afflicted with rheumatic pains and the scurvy; and a few are subject to vertigo and apoplexy. For the cure of all their internal disorders, they use no other medicine than the decoction of a certain species of moss; and when this cannot be procured, they boil the stalk of angelica in the milk of the rein-deer. In order to remove a fixed pain, they apply a large mushroom, burning hot, to the part affected; and this produces a blister, which is supposed to draw off the peccant humour. To their wounds they apply nothing but the turpentine that drops from the fir-tree. When they are frost bitten, (though according to the above extract from Linnaeus this seldom or never happens), we are told that they thrust a red-hot iron into a cheese made of rein-deer's milk, and with the fat that drops from it anoint the frozen member, which generally recovers. When a Laplander is supposed to be on his death-bed, his friends exhort him to die in the faith of Christ, and bear his sufferings with resignation, by remembering the passion of our Saviour. They are not, however, very ready to attend him in his last moments; and as soon as he expires, quit the place with precipitation, apprehending some injury from his spirit or ghost, which they believe remains with the corpse, and takes all opportunities of doing mischief to the living. The deceased is wrapped up in woollen or linen, according to his circumstances, and deposited in a coffin by a person selected for that purpose: but this office he will not perform, unless he is first secured from the ill offices of the manes, by a consecrated brass ring fixed on his left arm. The Christian religion in this country has not yet dispelled all the rites of heathenish superstition: together with the body they put into the coffin an ax, a flint, and steel, a flask of brandy, some dried fish and venison. With the ax the deceased is supposed to hew down the bushes or boughs that may obstruct his passage in the other world: the steel and flint are designed for striking a light, should he find himself in the dark at the day of judgment; and on the provision they think he may subsist during his journey.

The Muscovite Laplanders observe other ceremonies, that bear an affinity to the superstitions of the Greek church. They not only supply the defunct with money, but likewise provide him with money for the porter of paradise, and a certificate signed by the priest, and directed to St Peter, specifying, that the bearer had lived like a good Christian, and ought to be admitted into heaven. At the head of the coffin they place a little image of St Nicholas, who is greatly revered in all parts of Muscovy as a friend to the dead. Before the interment, the friends of the deceased kindle a fire of fir-boughs near the coffin, and express their sorrow in tears and lamentations. They walk in procession several times round the body, demanding, in a whining tone, the reason of his leaving them on earth. They ask whether he was out of humour with his wife; whether he was in want of meat, drink, clothing, or other necessaries; and whether he had not succeeded in hunting and fishing? These,

Lapland.

and other such interrogations, to which the defunct makes no reply, are intermingled with groans and hideous howlings; and, between whiles, the priest sprinkles the corpse and the mourners alternately with holy water. Finally, the body is conveyed to the place of interment on a sledge drawn by a rein-deer; and this, together with the cloaths of the deceased, are left as the priest's perquisite. Three days after the burial, the kinsmen and friends of the defunct are invited to an entertainment, where they eat the flesh of the rein-deer which conveyed the corpse to the burying-ground. This being a sacrifice to the manes, the bones are collected into a basket and interred. Two thirds of the effects of the deceased are inherited by his brothers, and the remainder divided among his sisters: but the lands, lakes, and rivers, are held in coparceny by all the children of both sexes, according to the division made by Charles IX. of Sweden, when he assigned a certain tract of land to each family.

The commerce of the Laplanders is more considerable than one would expect in a desert country inhabited by a savage ignorant people. They export great quantities of fish to the northern parts of Bothnia and White Russia. They likewise trade with the neighbouring countries of Norway, Sweden, Muscovy, and Finland, by selling rein-deer, fine furs, baskets and toys of their own manufacture, dried pikes, and cheese made of the rein-deer's milk. In return for these commodities they receive rixdollars, woollen cloaths, linen, copper, tin, flour, oil, hides, needles, knives, spirituous liquors, tobacco, and other necessaries. The Laplanders march in caravans to the fairs in Finland and Norway: these are composed of a long string of 30 or 40 rein-deer and pulkhas tied to one another, the foremost being led by a Laplander a-foot. When they have chosen a spot for an encampment, they form a large circle of their rein-deer and pulkhas ready yoked; and the animals lying down quietly on the snow, are fed with moss by their masters. The people kindle great fires, around which, men, women, and children sit, and sup on dried fish: but the more voluptuous spread out bear-skins under their tents, where they lie at their ease and smoke tobacco.

The revenue arising from this country is of no great consequence: it is paid partly in rix-dollars, but chiefly in furs; nay, some that can procure neither, pay the tribute in dried pikes. The produce of the mines forms likewise a considerable article. Fifty squirrel-skins, or one fox-skin, with a pair of Lapland shoes, are valued at one rixdollar. Part of the taxes is allotted for the maintenance of the Lapland clergy.—The frightful aspect of this country has been deemed a more effectual defence than artificial bulwarks and garri-sons, of which here are none; or than the arms and courage of the natives, who are neither warlike in themselves, nor in the least tinctured with discipline.

The Laplanders call themselves *Sahme-Same*, and *Samen-Almatjeh*. Their country they denominate *Same-Landa*, or *Same-aednam*; the Swedes style it *Lapland* or *Lappmarken*, and the inhabitants *Lappar*. The natives of those districts under the dominion of Sweden and Denmark are Lutherans; while many of those who are subject to Russia are still Pagans. Swedish

Lapland contains about eight churches, which in some parts lie at so great a distance from each other, that a native is frequently obliged to travel three days in order to attend divine service. The Laplanders, before their conversion to Christianity, which was not till lately introduced amongst them, possessed no books or manuscripts, though they knew many traditional histories and songs of ancient heroes and princes who once reigned over them; but involved in great uncertainty, and mixed with the most fabulous accounts. They have now a translation of the New Testament in their language; and many of the natives are able to read and write.

LAPLYSIA, or SEA-HARE; a genus of marine insects belonging to the order of vermes mollusca. The body is covered with membranes reflected. It hath a shield-like membrane on the back, a lateral pore on the right side, the anus on the extremity of the back, with four feelers resembling ears. The figure represents the depilans minor, which grows to two inches and a half in length, and to more than an inch in diameter: its body approaches to an oval figure, and is soft, punctated, of a kind of gelatinous substance, and of a pale lead colour; from the larger extremity there arise four oblong and thick protuberances: these are the tentacula; two of them stand nearly erect, two are thrown backward. It is not uncommon about our shores, especially off Anglesea. It causes, by its poisonous juice, the hair to fall off the hands of those that touch it; and is so extremely fetid as to create sickness at stomach.—The major, or greater sea-hare, grows to the length of eight inches.

LAPSANA, NIPPLEWORT: A genus of the polygama æqualis order, belonging to the Syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The receptacle is naked; the calyx caliculated, with all the inferior scales canaliculated or finely channelled. There are four species, which grow commonly as weeds by the sides of ditches. The young leaves of the common kind, called *dock-cresses*, have the taste of radishes, and are eaten raw at Constantinople as a salad. In some parts of England the common people boil them as greens, but they have a bitter and disagreeable taste.

LAPSE, in ecclesiastical law, a slip or omission of a patron to present a clerk to a benefice within six months of its being void: in which case, the benefice is said to be in *lapse*, or *lapsed*, and the right of presentation devolved to the ordinary.

And if the ordinary neglect to present during the same time, the right of presentation accrues to the metropolitan, and to the king by neglect of the metropolitan. This right of lapse was first established in the reign of Henry II. when the bishops first began to exercise universally the right of institution to churches: and therefore when there is no right of institution, there is no right of lapse; so that no donative can lapse to the ordinary, unless it hath been augmented by the king's bounty; but no right of lapse can accrue, when the original presentation is in the crown. In case the benefice becomes void by death, or cession through plurality of benefices, there the patron is bound to take notice of the vacancy at his own peril; but in case of a vacancy by resignation or canonical deprivation, or if a clerk presented be refused for in-

Laplysia  
Lapsc.Plate  
CCLXII

suffi-

ing sufficiency, these being matters of which the bishop alone is presumed to be cognizant, here the law requires him to give notice thereof to the patron, otherwise he can take no advantage by way of lapse; neither shall any lapse accrue thereby to the metropolitan or the king. If the bishop refuse or neglect to examine and admit the patron's clerk, without good reason assigned or notice given, he shall have no title to present by lapse: and if the right of presentation be litigious or contested, and an action be brought against the bishop to try the title, no lapse shall occur till the question of right be decided. If the bishop be both patron and ordinary, he shall not have a double time allowed him to collate in: and if the bishop doth not collate his own clerk immediately to the living, and the patron presents, though after the six months are lapsed, yet the presentation is good, and the bishop is bound to institute the patron's clerk. If the bishop suffer the presentation to lapse to the metropolitan, the patron also has the same advantage if he presents before the archbishop has filled up the benefice: yet the ordinary cannot, after lapse to the metropolitan, collate his own clerk to the prejudice of the archbishop. But if the presentation lapses to the king, the patron shall never recover his right till the king has satisfied his turn by presentation; for *nullum tempus occurrit regi*.

LAPWING, in ornithology. See TRINGA.

LAQUEARIUS, a kind of athleta among the ancients, who in one hand held a *laqueus*, i. e. a sort of snare, wherewith to embarrass and entangle his antagonist, and in the other a poignard to stab him.

LAQUEUS, in surgery, a kind of ligature so contrived, that, when stretched by any weight or the like, it draws up close. Its use is to extend broken or dis-jointed bones, to keep them in their places while they are set, and to bind the parts close together.

LARARIUM, was a chapel which the Romans frequently had in their houses for the household gods, called *lares*. Spartan says, that Alexander the son of Mameus kept in his lararium the figure of our Saviour, together with his other idols.

LAR-BEARD, among seamen, the left-hand side of the ship when you stand with your face towards the head.

LARCENY, or THEFT, by contraction for latrocinium, is distinguished by the law into two sorts: the one called *simple larceny*, or plain theft, unaccompanied with any other atrocious circumstance; and *mixed or compound larceny*, which also includes in it the aggravation of a taking from one's house or person.

I. *Simple larceny*, when it is the stealing of goods above the value of twelvepence, is called *grand larceny*; when of goods to that value, or under, is *petit larceny*: offences, which are considerably distinguished in their punishment, but not otherwise. See THEFT.

II. *Mixed, or compound larceny*, is such as has all the properties of the former, (see THEFT); but is accompanied with either one or both of the aggravations of a taking from one's house or person. First therefore of larceny from the house, and then of larceny from the person.

1. Larceny from the house, though it might seem

to have a higher degree of guilt than simple larceny, yet is not at all distinguished from the other at common law: unless where it is accompanied with the circumstance of breaking the house by night; and then it falls under another description, viz. that of burglary, (see BURGLARY). But now by several acts of parliament (the history of which is very ingeniously deduced by a learned modern writer †, who hath shown them to have gradually arisen from our improvements in trade and opulence), the benefit of clergy is taken from larcenies committed in an house in almost every instance: except that larceny of the stock or utensils of the plate glass company from any of their houses, &c. is made only single felony, and liable to transportation for seven years. The multiplicity of the general acts is apt to create some confusion; but upon comparing them diligently, we may collect, that the benefit of clergy is denied upon the following domestic aggravations of larceny; viz. first, in larcenies above the value of twelvepence, committed, 1. In a church or chapel, with or without violence, or breaking the same: 2. In a booth or tent in a market or fair, in the day-time or in the night, by violence or breaking the same, the owner or some of his family being therein: 3. By robbing a dwelling-house in the day-time (which *robbing* implies a breaking), any person being therein: 4. In a dwelling-house by day or by night, without breaking the same, any person being therein and put in fear; which amounts in law to a robbery: and in both these last cases the accessory before the fact is also excluded from his clergy. Secondly, in larcenies to the value of five shillings, committed, 1. By breaking any dwelling-house, or any out house, shop, or warehouse thereunto belonging, in the day-time, although no person be therein; which also now extends to aiders, abettors, and accessories before the fact: 2. By privately stealing goods, wares, or merchandise in any shop, warehouse, coach-house, or stable, by day or by night; though the same be not broken open, and though no person be therein: which likewise extends to such as assist, hire, or command the offence to be committed. Lastly, in larcenies to the value of forty shillings in a dwelling-house, or its out houses, although the same be not broken, and whether any person be therein or not; unless committed against their masters by apprentices under the age of 15. This also extends to those who aid or assist in the commission of any such offence.

2. Larceny from the person, is either by privately stealing, or by open and violent assault, which is usually called *robbery*.

The offence of *privately stealing* from a man's person, as by picking his pocket or the like, privily, without his knowledge, was debarred of the benefit of clergy so early as by the statute 8 Eliz. c. 4. But then it must be such a larceny as stands in need of the benefit of clergy, viz. of above the value of 12 d.; else the offender shall not have judgment of death. For the statute creates no new offence; but only takes away the benefit of clergy, which was a matter of grace, and leaves the thief to the regular judgment of the ancient law. This severity (for a most severe law it certainly is) seems to be owing to the ease with which such offences are committed, the difficulty of guarding against them, and the boldness with which they were prac-

Larceny.

Lardner.

praised (even in the queen's court and presence) at the time when this statute was made: besides that this is an infringement of property in the manual occupation or corporal possession of the owner, which was an offence even in a state of nature. And therefore the *fascularii*, or cutpurfes, were more severely punished than common thieves by the Roman and Athenian laws.

As to open and violent larceny from the person, see ROBBERY.

LAR, a town of Persia, in the province of Fars, with a castle. It carries on a great trade in silk; and its territory abounds in oranges, lemons, and very large tamarinds. E. Long. 54. 15. N. Lat. 27. 30.

LARACHA, an ancient and strong town of Africa, in the kingdom of Fez. It is seated at the mouth of a river of the same name, with a good harbour. It was once in the possession of the Spaniards; but the Moors took it from them. W. Long. 5. 55. N. Lat. 35. 0.

LARDNER (Nathaniel), an eminent English dissenting divine, was born at Hawkhurst in Kent, June 6. 1684. After a grammatical education, to which great attention must have been given, and in which a no less rapid progress must have been made, he was sent first to a dissenting academy in London, which was under the care of the Rev. Dr Joshua Oldfield; and thence, in his 16th year, to prosecute his studies at Utrecht, under the celebrated professors D'Uries, Grævius, and Burman. Here he remained somewhat more than three years, and then removed for a short space to Leyden. In 1703 he returned to England, continuing at his father's house to employ himself by close and diligent preparation for the sacred profession which he had in view. Qualified as he was, it was not till 1709 that he preached his first sermon, from Romans i. 16.—“a text (his biographer remarks) than which there could not have been a more proper one for a man who was destined in the order of Divine Providence to be one of the ablest advocates for the authenticity and truth of the Christian revelation that ever existed.”

A few years after this, Lardner was received into Lady Treby's family as domestic chaplain and tutor to her son, and continued in this comfortable situation till her ladyship's death in 1721. This event threw him into circumstances of some perplexity, having preached to several congregations during his residence: with Lady Treby without the approbation or choice of any one congregation. Here we are told, “that it reflects no honour on the Dissenters, that a man of such merit should so long have been neglected.” But it has been observed upon this, that the pulpit was not the place in which Mr Lardner was calculated either to convey improvement or acquire reputation. Dr Kippis afterwards informs us, “that his mode of elocution was very unpleasant; that from his early and extreme deafness he could have no such command of his voice as to give it a due modulation; and that he greatly dropped his words.” It cannot then, as his biographer adds, be matter of surprize that he was not popular; nor, it may be added, can it be any reflection on the congregations to which he occasionally preached, that they did not choose for their minister a man, who, notwithstanding his great learning and amiable

virtues, was so deficient as a public speaker, that it was impossible to hear him with any pleasure, and scarcely without pain.

Though Mr Lardner had no church at which he officiated as minister, he was engaged with some of his dissenting brethren in preaching a Tuesday-evening lecture at the Old Jewry. Acquainted probably with the direction of his studies, they appointed him to preach on the proof of the *Credibility of the Gospel History*. This he discussed, we are told, in two sermons; and prosecuting the subject which he had taken up in these discourses, in Feb. 1727, he published, in two volumes octavo, the *First Part of "The Credibility of the Gospel History, or the Facts occasionally mentioned in the New Testament confirmed by Passages of ancient Authors who were contemporary with our Saviour or his Apostles, or lived near their Time."* An *Appendix* was subjoined, relating to the time of Herod's death.

Thus Mr Lardner commenced author, and began his literary career with singular reputation. “It is scarcely necessary to say (observes Dr Kippis), how well this work was received by the learned world. Not only was it highly approved by the Protestant Dissenters, with whom the author was more immediately connected, but by the clergy in general of the established church; and its reputation gradually extended into foreign countries. It is indeed an invaluable performance, and hath rendered the most essential service to the cause of Christianity. Whoever peruses this work (and to him that does not peruse it, it will be to his own loss) will find it replete with admirable instruction, sound learning, and just and candid criticism.” These two, with the subsequent fifteen, volumes octavo, and the four thin quartos intitled *Jewish and Heathen Testimonies*, occupied him, with the interruption arising from some smaller productions, during the space of *forty-three years*.

Dr Kippis gives us a particular account of the time when each volume was published, and of the subjects discussed in each. The following useful information which the Doctor introduces, in speaking of the “*Supplement to the Credibility*,” deserves well to be transcribed. “I cannot avoid strongly recommending this work (says he) to the attention of all young divines. Indeed, I think that it ought to be read by every theological student before he quits the university or academy in which he is educated. There are three other works which will be found of eminent advantage to those who are intended for, or beginning to engage in, the Christian ministry. These are, Butler's *Analogy*, Bishop Law's *Considerations on the Theory of Religion*, and Dr Taylor's *Key to Apostolical Writings*, prefixed to his *Paraphrase on the Epistle to the Romans*. Without agreeing with every circumstance advanced in these works, it may be said of them with the greatest truth, that they tend to open and enlarge the mind; that they give important views of the evidence, nature, and design of revelation; and that they display a vein of reasoning and inquiry which may be extended to other objects besides those immediately considered in the books themselves.—It must not be forgotten, that the *Supplement to the Credibility* has a place in the excellent collection of treatises in divinity which has lately been published by Dr Wat-

Monthly  
Reviews,  
Jan. 1789

do son bishop of Landaff. For a collection which cannot fail of being eminently conducive to the instruction and improvement of younger clergymen, and for the noble, manly, and truly evangelical preface by which it is preceded, this great prelate is entitled to the gratitude of the Christian world." It may not be improper to add, that the *Supplement to the Credibility* was some years ago published separately by the booksellers, under the title of *The History of the Gospels and Epistles*.

Applauded as Dr Lardner's works were, he received little recompence for them. Some of the latter volumes of the *Credibility* were published at a loss; and at last he sold the copy-right and all the remaining printed copies to the booksellers, for the trifling sum of L. 150. His object, however, was not private emolument, but to serve the interests of truth and virtue; and it pleased Divine Providence to spare his life, both to complete his extensive plan, and to see the last volume, the 4th of the *Testimonies*, published. This was in 1767. He was seized with a decline in the summer following; and was carried off in a few days at Hawk-huril, the place of his nativity, where he had a small paternal estate, in the 85th year of his age.

LAREDO, a sea-port town of Spain, in the bay of Biscay, with a large safe harbour. It is 30 miles west of Bilbao, and 72 north by west of Burgos. W. Long. 3. 45. N. Lat. 43. 23.

LARENTINALIA, in antiquity, a feast held among the Romans on the 23d day of December, but ordered to be observed twice a year by Augustus; by some supposed to have been in honour of the Lares, but by others, with more probability, in honour of *Acce Laurentia*; and to have been the same with *Laurentalia*.

LARES, among the ancients, derived by Apuleius (*De Deo Socratis*), from *lar*, *familiaris*; a kind of domestic genii, or divinities, worshipped in houses, and esteemed the guardians and protectors of families; supposed to reside more immediately in the chimney corner.

The Lares were distinguished from the Penates; as the former were supposed to preside over house-keeping, the servants in families, and domestic affairs; and the latter were the protectors of the masters of families, their wives and children. Accordingly the Lares were dressed in short succinct habits, to show their readiness to serve; and they held a sort of cornucopia in their hands, as a signal of hospitality and good house-keeping. According to Ovid, there were generally two of them, who were sometimes represented with a dog at their feet.

Plutarch distinguishes good and evil Lares, as he had before done good and evil Genii.—There were also some public, others private Lares.

Apuleius tells us the domestic Lares were no more than the souls of departed persons, who had lived well, and discharged the duties of their station; whereas those who had done otherwise, were vagabonds, wandering about and frightening people, called *Larvæ* and *Lemures*.

The Lares were also called *Penates*, and were worshipped under the figures of little marmosets, or images of wax, silver, or earthen ware.

The public Lares were also called *Compitales*, from *compitum* "a cross-way;" and *Viales*, from *via* "a way

or public road;" as being placed at the meetings of roads and in the high-ways, and esteemed the patrons and protectors of travellers. Lares.

Their private Lares took care of particular houses and families: these they also called *Præstitæ*, from *præsto*;

*Quod præstant oculis omnia tuta suis.*

Ovid Fast.

They gave the name *Urbani*, i. e. "Lares of cities," to those who had cities under their care; and *Hospitali*, to those who were to keep their enemies off. There were also Lares of the country, called *Rurales*, as appears by several antique inscriptions.

The Lares were also genial gods, and were supposed to take care of children from their birth. It is for this reason that when Macrobius tells us the Egyptians had four gods who presided over the birth of children, viz. the Genius, Fortune, Love, and Necessity, called *Præstitæ*, some interpret him as if he had said the Egyptians had Lares; but they have mentioned that there was a great difference between the Lares of the Romans and the *Præstitæ* of the Egyptians. However, the learned Mr Bryant affirms that they were the same.

The ancients differ extremely about the origin of the Lares. Varro and Macrobius say that they were the children of Mania; Ovid makes them the issue of Mercury, and the Naiad Lara, or Larunda; Apuleius assures us they were the posterity of the Lemures; Nigradius, according to Arnobius, made them sometimes the guardians and protectors of houses, and sometimes the same with the Curetes of Samothracia, which the Greeks call *Idæi dætyli*. Nor was Varro more consistent in his opinion of these gods; sometimes making them the manes of heroes, and sometimes gods of the air.

T. Tatius king of the Sabines, was the first who built a temple to the Lares. The chimney and fireplace in the house were particularly consecrated to them.

Tertullian tells us, the custom of worshipping the Lares arose from this, that they anciently interred their dead in their houses; whence the credulous people took occasion to imagine their souls continued there also, and proceeded to pay them divine honours. To this it may be added, that the custom being afterwards introduced of burying in the high-ways, they might hence take occasion to regard them as gods of the high-ways.

The victim offered to the Lares in the public sacrifices was a hog: in private, they offered them wine, incense, a crown of wool, and a little of what was left at the table. They also crowned them with flowers, particularly the violet, myrtle, and rosemary. Their symbol was a dog, which was usually represented by their side, on account of its fidelity and the service it does to man in watching his house. They were sometimes also represented as clothed in a dog's skin.

The term *Lares*, according to Mr Bryant, was formed from *laren*, an ancient word by which the ark was represented: and he supposes that the Lares and Manes were the same domestic deities under different names; and that by these terms the Hetrurians and Latins denoted the *diæ arkite*, who were no other than their arkite ancestors, or the persons preserved in the laren or ark; the genius of which was Isis, the reputed

Large  
||  
Largæ.

ted parent of the world. He observes farther, that they are described as dæmons and genii, who once lived on earth, and were gifted with immortality. Arnobius styles them *Lares quosdam genios & sanctorum animas*; and he says, that according to Varro, they were the children of Mania. Huetius (Demont. Prop. 4. p. 139.) adds, that Mania had also the name of *Larunda*; and she is styled the mother of the dæmons. By some she is called *Lara*, and was supposed to preside over families; and children were offered at her altar in order to procure her favour. In lieu of these they in after-times offered the heads of poppies and pods of garlic.

LARGE, a sea term applied to the wind when it crosses the line of a ship's course in a favourable direction, particularly on the beam or quarter. Thus, if a ship steer west, then the wind in any point of the compass to the eastward of the south or north may be called *large*, unless when it is directly east, and then it is said to be right aft. Sailing large is, therefore, advancing with a large wind, so as that the sheets are slackened and flowing, and the bow-lines entirely disused. This phrase is generally opposed to sailing close-hauled.

LARGESS. See LARGITIO.

LARGITIO, in Roman antiquity, was a distribution of corn, provision, cloaths, money, &c. to the people. Gracchus, when tribune, to make himself popular, passed a law for supplying the Roman citizens with corn at a very low rate, out of the public granaries. Claudius, another tribune, with the same views to popular applause, procured it to be distributed gratis.—Cato, to win the common people from Cæsar, persuaded the senate to do the same, and 300,000 citizens shared in the distribution. Cæsar, after his triumph, extended his bounty to 150,000, giving them each a *mina*. The Roman emperors enlarged still further the list of those who were to partake of their distributions. Largitio is frequently taken in a bad sense, to signify a masked bribery; whereby candidates purchased votes, when they stood for places of honour or trust in the state. The distribution of money was called *congiarium*, and the distributors *divisores* and *sequestres*.

LARGS, a village on the west coast of Scotland, opposite to the island of Bute; rendered memorable by the defeat of the Norwegians here in their last invasion of this country.—This invasion was made in the year 1263, with a fleet of 160 sail and an army of 20,000 men, commanded by Haquin king of Norway, whose ravages on the coast of Ayr, Bute, and Arran, reaching the Scottish court, an army was immediately assembled by Alexander III. and a bloody engagement ensued at this village, when 16,000 of the invaders were slain in the battle and flight, with 5000 Scots. Haquin escaped to the Orkneys, where he soon after died of grief. The entrenchments of the Norwegian camp may still be traced along the shore of this place. The Scottish commanders who fell in battle were buried in a rising field, near the village; three or four persons were interred in one grave, on each side of which was a large stone, a third was placed across the grave, supported at the extremities by the side stones, and in this rude manner the warriors lay entombed. Some years ago the proprietor of the field demolished these repositories of the dead, leaving only one (a

Nº 175.

special favour!), which serves to give an idea of the whole.

LARINO, a town of Italy, in the kingdom of Naples, in the Capitanata, with a bishop's see. E. Long. 15. 51. N. Lat. 41. 48.

LARISSA, an ancient, rich, and celebrated town of Greece, in the province of Janna or Thessaly, with an archbishop's see of the Greek church, a palace, and several handsome mosques. According to Virgil, it was the country of Achilles. It was also the place where Philip the father of Alexander the Great resided.—The inhabitants carry on a considerable trade. The city is agreeably seated on the river Peneus, in E. Long. 23. 36. N. Lat. 38. 51.

LARIX, the LARCH-TREE. See PINUS.

LARK, in ornithology. See ALAUDA, and BIRD-Catching.

The lark is not only a very agreeable bird for the cage, but will live upon almost any food, so that it have once a week a fresh tuft of three-leaved grass. The proper method of keeping them in health is this: there must be two pans of food, the one containing meat, the other oatmeal and hempseed. A very good food is the following: boil an egg very hard, to which add the crumb of a halfpenny loaf, and as much hempseed; let the egg be chopped very small, and the hempseed bruised in the mortar; when these are mixed, the bread is to be crumbled in among the rest, and the whole to be rolled together with a common rolling-pin, and kept for use. There must be some fine small gravel strewed at the bottom of the cage, and renewed at farthest once in a week. This will prevent the bird's feet from getting hurt by being clogged with the dung; and his basking in this will keep him also from growing lousy, after which few come to good. There must be a perch in the cage, and it must either be lined with green bays, or made of fine matting, which the lark is very fond of. When the bird is first taken, some meat must be strewed upon the sand in the bottom of the cage; for it will be sometimes almost famished before it finds the meat in the pan.

The cock-bird of this kind is known from the hen by the loudness and length of his call, by his tallness as he walks about the cage, and by his doubling his notes in the evening, as if he was going with his mate to roost. A better rule than all others, however, is his singing strong; for the hen wood-lark sings but very weakly.—Both the cock and hen of this kind are subject to many disorders; the principal of these are cramps, giddiness of the head, and breeding lice. Cleanliness is the best cure for the first and the last of these complaints; but we know of no cure for the other. A good strong bird, however, will often last very well five or six years, and improve all the time.

LARKSPUR. See DELPHINIUM.

LARRIBUNDAR, a sea-port town of Asia, in Indostan; seated at the mouth of the river Sinda, or Indus, with a harbour capable of receiving ships of 200 tons burden. It is but a small place, consisting of about 100 houses built with wood; but has a stone fort, with a few guns. E. Long. 67. 0. N. Lat. 25. 0.

LARVA, in natural history, a name given by Linnaeus to insects in that state, called by other writers *cruca* or *caterpillar*. See Transformation of INSECTS.

LARVÆ,

**LARVÆ**, in antiquity, derived from the Hetruscan word *lar* or *lars*, signifying "prince or lord," denoted the ghosts of the deceased, considered as wicked and mischievous. Hence is formed the term *larvatus*, i. e. *larvæ indutus* or *demoniac*. The ingenious Mr Farmer urges the etymology and use of this term to prove, that the heathen demons were human ghosts.—The larvæ were also called *lemures*.

**LARVÆ**, in mineralogy, the same with petrifications. See **PETRIFFICATIONS**.

**LARUS**, the **GULL**, in ornithology; a genus belonging to the order of anseres, the characters of which are these: The bill is strait, cultrated, a little crooked at the point, and without teeth; the inferior mandible is gibbous below the apex; the nostrils are linear, a little broader before, and situated in the middle of the beak. The different species are principally distinguished by their colour.

1. The *marinus*, or black-backed gull, is in length 29 inches; in breadth five feet nine. The bill is very strong and thick, and almost four inches long; the colour a pale yellow; but the lower mandible is marked with a red spot, with a black one in the middle. The head, neck, whole under-side, tail, and lower-part of the back, are white: the upper-part of the back, and wings, are black; the quill-feathers tipped with white, the legs of a pale flesh-colour. It inhabits several parts of England, and breeds on the highest cliffs. The egg is blunt at each end; of a dusky olive-colour; quite black at the greater end, and the rest of it thinly marked with dusky spots. It is also common on most of the northern coasts of Europe. It frequents Greenland; but chiefly inhabits the distant rocks. It lays three eggs in May, placing them on the heaps of dung which the birds leave there from time to time. It is said to attack other birds, and to be particularly an enemy to the eider duck. It very greedily devours carrion, though the most general food is fish. It is common also in America, as low as south Carolina, where it is called the *old wife*.

2. The *cataractes*, or Skua gull, is in length two feet; the extent four feet and a half; the weight three pounds; the bill is two inches one-fourth long, very much hooked at the end, and very sharp; the upper mandible covered more than half-way with a black cere or skin, as in the hawk kind; the nostrils are placed near the bend, and are pervious. The feathers on the head, neck, back, scapulars, and coverts of the wings, are of a deep brown, marked with rust-colour (brightest in the male). The breast, belly, and vent, are ferruginous, tinged with ash-colour. The tail when spread is circular, of a deep brown, white at the root, and with shafts of the same colour. The legs are covered with great black scabons: the talons black, strong, and crooked; the interior remarkably so.—This bird inhabits Norway, the Ferroe isles, Shetland, and the noted rock Foula a little west of them. It is also a native of the South Sea. It is the most formidable of the gulls; its prey being not only fish, but, what is wonderful in a web-footed bird, all the lesser sort of water-fowl, such as teal, &c. Mr Schroter, a surgeon in the Ferroe isles, relates that it likewise preys on ducks, poultry, and even young lambs. It has all the fierceness of the eagle in defending its young; when

the inhabitants of those islands visit the nest, it attacks them with great force, so that they hold a knife erect over their heads, on which the skua will transfix itself in its fall on the invaders. The Rev. Mr Low, minister of Birsá in Orkney, confirmed part of the above account: On approaching the quarters of these birds, they attacked him and his company with most violent blows; and intimidated a bold dog of Mr Low's in such a manner, as to drive him for protection to his master. The natives are often very rudely treated by them while they are attending their sheep on the hills; and are obliged to guard their heads by holding up their sticks, on which the birds often kill themselves. In Foula it is a privileged bird, because it defends the flocks from the eagle, which it beats and pursues with great fury; so that even that rapacious bird seldom ventures near its quarters. The natives of Foula on this account lay a fine on any person who destroys one: they deny that it ever injures their flocks or poultry; but imagine it preys on the dung of the arctic and other larger gulls, which it persecutes till they moot for fear.—These birds are also frequent in many high latitudes of the southern hemisphere: our circumnavigators met with them in Falkland isles, particularly about Port Egmont, whence called *Port Egmont hens*. In this place, and at Terra del Fuego, they were observed to make their nests among the dry grass. After breeding-time, they disperse over the ocean, and for the most part are seen in pairs. They are met with in Kerguelen's land, and off the Cape of Good Hope, and other parts. In all places its manners are the same in respect to ferocity: it is frequently seen to attack the largest albatross, beating it with great violence so long as it remains on the wing; at which time this cowardly giant finds no other resource than to settle on the water; upon which the skua flies away.

3. The *parasiticus*, or dung-hunter, is in length 21 inches. The bill is an inch and a half long, pretty much hooked, and of a dusky colour: the nostrils are placed in a kind of cere: the top of the head is black; the sides of it, forehead, neck, and all beneath, white: across the breast there is a pale dusky bar: the upper parts of the body, wings, and tail, are black; the base of the quills white on the inner webs; and the two middle feathers of the tail are near four inches longer than the rest: the legs are scaly, not very stout; the colour of them is black. The female is said to be entirely brown, palest beneath; and the middle tail feathers only two inches longer than the others. This is a northern species; and very common in the Hebrides, where it breeds on heath. It comes in May, and retires in August; and if disturbed flies about like the lapwing, but soon alights. It is also found in the Orkneys; and on the coasts of Yorkshire, where it is called the *feaser*. It is met with likewise on the northern coasts of Sweden, Denmark, and Russia, as far as Kamtchatka; and it is common in Greenland, where it frequents the open sea, as well as the bays. The female makes an artless nest of grass and moss, on a hillock in some marshy place, and lays two ash-coloured eggs, spotted with black, the size of those of a hen. This bird does not often swim, and flies generally in a slow manner, except it be in pursuit of other birds; which it often attacks, in order to make them dis-

LXXIII.

gorge the fish or other food, which this common plunderer greedily catches up. Most authors have told us, that it is the dung of the birds which it searches after in the pursuit; but latter observations inform us that the circumstance is not true; though, from the supposition of its being so, the bird has obtained the name of *strut-jager*.

4. The fuscus, or herring-gull, weighs upwards of 30 ounces; the length 23 inches, its breadth 52: the bill is yellow, and the lower mandible marked with an orange-coloured spot: the back and coverts of the wings are ash-coloured; the upper part of the five first quill-feathers are black, marked with a white spot near their end; the legs of a pale flesh-colour. These birds breed on the ledges of rocks that hang over the sea: they make a large nest of dead grass; and lay three eggs of a dirty white, spotted with black. The young are ash coloured, spotted with brown. They do not come to their proper colour the first year: this is common to other gulls; which has greatly multiplied the species among authors, who are inattentive to these particulars. This gull is a great devourer of fish, especially of that from which it takes its name: it is a constant attendant on the nets, and so bold as to seize its prey before the fishermen's faces.—The herring gull is common in this kingdom, and frequents the same places as the black-backed. It is also found in most of the northern parts of Europe, as well as about the Caspian and Black seas and the rivers which fall into them, and about the great lakes of Siberia. It is found likewise in Iceland, Greenland, and Hudson's Bay. In winter it migrates south, being found in Jamaica; and is said to breed on some of the islands on the coast of South Carolina.

5. The *nævius*, or *wagel*, is a large species, being near two feet in length, and in breadth about five; weight, near three pounds. The bill is black; two inches and a half long: the irides are dusky: the whole plumage is composed of a mixed brown, ash-colour, and white; the middle of each feather brown: the under parts of the body are the same, but paler: the quills are black: the lower part of the tail is mottled black and white; near the end is a bar of black, and beyond this the end is white: the legs are of a dirty flesh-colour, in some white.—This species frequents the sea-shores of many parts of England, though not in any considerable numbers. At times it is seen on the banks of the Thames along with other gulls; and is there supposed to be the female of the black-backed: but this has not yet been determined sufficiently by authors.

6. The *hybernus*, or winter-gull, winter-mew, or cobby-moddy, weighs from 14 to 17 ounces: the length 18 inches, the breadth three feet nine. The irides are hazel: the bill is two inches long, but the slenderest of any gull; black at the tip, and whitish towards the base. The crown of the head, and hind-part and sides of the neck, are white, marked with oblong dusky spots: the forehead, throat, middle of the breast, belly, and rump, white; the back and scapulars of a pale grey, the last spotted with brown: the coverts of the wings are of a pale brown, edged with white; the first quill-feather is black, the succeeding ones are tipped with white: the tail is white, crossed near the

end with a black bar; the legs are of a dirty bluish white. This kind frequents, during winter, the moist meadows in the inland parts of England, remote from the sea. The gelatinous substance, known by the name of *star-shot*, or *star-gelly*, owes its origin to this bird, or some of the kind; being nothing but the half digested remains of earth-worms, which these birds feed on, and often discharge from their stomachs.

7. The *canus*, or common gull, is in length 16 or 17 inches; in breadth 36; weight one pound. The bill is yellow: the irides are hazel, and the eye-lids brown: the head, neck, under parts of the body, and tail, are white; the back and wings, pale grey: the outer edge of the four first quills, and tips of the first five, are black; but the fourth and fifth have a white spot at the tips; the rest, except the three nearest the body, have the ends white: the legs are of a dull greenish white. This seems to be the most common of all the gulls, being found in vast numbers on our shores and rivers which are contiguous to the sea. It is seen also very far north, as far as Iceland and the Russian lakes: it is met with in the neighbourhood of the Caspian Sea, in various shores of the Mediterranean, and as far south as Greece: and it is found also in America, on the coast of Newfoundland. It breeds on the rocks and cliffs, like others of the genus; and the eggs are two inches and a half in length, of a deep olive brown, marked with irregular deep reddish blotches. It is a tame species, and may be seen by hundreds on the shores of the Thames and other rivers, in the winter and spring, at low tides, picking up the various worms and small fish left by the tides; and will often follow the plough in the fields contiguous, for the sake of worms and insects which are turned up, particularly the cockchafer or dorbeetle in its larvæ state, which it joins with the rooks in devouring most greedily.

8. The *tridactylus*, or tarrock, is in length 14 inches, breadth 36; weight seven ounces. The bill is short, thick, and black: the head, neck, and under parts, are white: near each ear, and under the throat, there is a black spot; and at the hind part of the neck a crescent of black: the back and scapulars are bluish grey; the wing-coverts dusky edged with grey, some of the larger wholly grey: the exterior sides and ends of the first four quills are black, tips of the two next black, all the rest white: the ten middle feathers of the tail are white tipped with black, the two outermost wholly white: the legs are of a dusky ash-colour; in lieu of the back toe, it has only a protuberance. This breeds in Scotland with the kittiwake; and inhabits other parts of northern Europe, quite to Iceland and Spitzbergen, the Baltic and White Sea, as also Kamtehatka. It is common in Greenland in summer. It comes in spring, and frequents the sea-shores; builds in the rocky crags of the bays; in June lays two eggs of a greenish ash-colour spotted with brown; and retires from the shores in autumn. It is observed frequently to attend the whales and seals, for the sake of the fish which the last drive before them into the shallows, when these birds dart into the water suddenly and make them their prey. They are very noisy birds, especially during the time of incubation. They swim well, and fly equally well, and for a long time together: they are often observed

rus. on portions of ice swimming in the sea. Both the flesh and eggs are esteemed by the Greenlanders, and the skins used as garments.

9. The rissa, or kittiwake, is in length 14 inches, in extent three feet two. When arrived at full age, the head, neck, belly, and tail, are of a snowy whiteness; behind each ear is sometimes a dusky spot: the back and wings are grey: the exterior edge of the first quill-feather, and tips of the four or five next, are black: the bill is yellow, tinged with green; and the inside of the mouth is orange: the legs are dusky, with only a knob instead of the back toe. It inhabits the romantic cliffs of Flamborough-head (where it is called *petrel*), the Bass isle, the vast rocks near the castle of Slains in the county of Aberdeen, and Priestholm isle. The young of these birds are a favourite dish in North Britain, being served up roasted, a little before dinner, in order to provoke the appetite; but from their rank taste and smell, seem much more likely to produce a contrary effect. This bird is likewise met with at Newfoundland; in Greenland, Spitzbergen, Iceland, and the north of Europe; the arctic coast of Asia; and Kamchatka. By the Icelanders it is called *rissa*. Some authors affirm the kittiwake to be the tarrock in a state of perfection; while others maintain the contrary.

10. The ridibundus, pewit, or black-head gull, is in length 15 inches, breadth three feet; weight 10 ounces. The bill is rather slender, and of a blood-red: the eye-lids are red, and the irides hazel: the head and throat are dusky brown, in old birds black; and on each eye-lid is a small white spot: the back and wings are of an ash-colour: the neck, all the under parts, and tail, are white: the ten first quills are white, margined and more or less tipped with black; the others of an ash-colour, with white ends: the legs are of the colour of the bill, the claws black. This species breeds on the shores of some of our rivers; but full as often in the inland fens of Lincolnshire, Cambridge-shire, and other parts of England. They make their nest on the ground, with rushes, dead grass, and such like; and lay three eggs of a greenish brown marked with red brown blotches. After the breeding season, they again disperse to the sea-coasts. They breed also in Northumberland and Scotland; and are found throughout Russia and Siberia, as far as Kamchatka, but not farther to the north. They are seen throughout the winter at Aleppo, in great numbers; and so tame, that the women are said to call them from the terraces of their houses, throwing up pieces of bread, which these birds catch in the air. They inhabit North America, coming into New England in May and departing in August. The young birds in the neighbourhood of the Thames are thought good eating, and are called the *red-legs*. They were formerly more esteemed, and numbers were annually taken and fattened for the table. Plott gives a marvellous account of their attachment to the lord of the soil they inhabit; inasmuch, that on his death they never fail to shift their quarters for a certain time. Whitelock, in his Annals, mentions a piece of ground near Portsmouth, which produced to the owner 40 l. a-year by the sale of pewits, or this species of gull. These are the *sea-gulls* that in old times were admitted to the

noblemens tables. The note of these gulls is like a hoarse laugh.

11. The atricilla, or laughing-gull, is in length 18 inches, breadth three feet. It differs from that bird only in the legs, which are black instead of red. It is found in Russia on the river Don, particularly about Tscherscafk. The note resembles a coarse laugh, whence the name of the bird. Is met with also in different parts of the continent of America; and is very numerous in the Bahama islands.

There are 9 or 10 other species of this genus.

LARYNX, in anatomy, the upper part of the wind-pipe. See ANATOMY, n<sup>o</sup> 116.

LASCARIS (Andrew John), surnamed *Ryndacenus*, of an ancient Greek family, went into Italy, after the taking of Constantinople by the Turks in 1453. He was well received by Laurence de Medicis, a distinguished protector of learned men; and was twice sent to Constantinople to collect the best Greek manuscripts, by which means numberless scarce and valuable treasures of literature were carried into Italy. At his return Louis XII. king of France prevailed on him to settle in the university of Paris, and sent him twice ambassador to Venice. Ten years after, cardinal John de Medicis being elected pope, under the name of *Leo X.* John Lascaris, his old friend, went to Rome, and had the direction of a Greek college. He died at Rome in 1535, at about the 90th year of his age. He brought into the West most of the fine Greek manuscripts that are now extant, and composed some epigrams in Greek and Latin.

LASCARIS (Constantine), one of the Greeks who were principally concerned in the revival of learning in the West, retired into Italy in 1454, and taught polite literature at Milan, whither he was called by Francis Sforza; he afterwards went to Rome, where he was well received by Cardinal Bessarion. He afterwards taught rhetoric and the Greek tongue at Naples; and ended his days at Messina, leaving the senate of that city many excellent manuscripts which he had brought from Constantinople. He was interred at the public expence, and the senate of Messina erected a marble tomb to his memory. He wrote some grammatical works.

LASERPITIUM, LAZAR-WORT: A genus of the dignia order, belonging to the pentandria class of plants; and in the natural method ranking under the 45th order, *Umbellata*. The fruit is oblong, with eight membranaceous angles; the petals inflexed, emarginated, and patent. There are nine species, none of which are at all remarkable for their beauty, so are only preserved in botanic gardens for the sake of variety. They are natives of Germany, Italy, and the south of France. All of them abound with an acrid juice, which turns to an excessively acrimonious resin. This was used by the ancients to take away black and blue spots that came by bruises or blows, as also to take away excrescences: it was also by some of the ancients used internally; but produced such violent effects, that the more prudent refrained from the use of it. It is generally supposed that the silphium of the ancients was procured from one of the species of this genus; but of this we are at present ignorant.

LASH, or LACE, in the sea-language, signifies to

Lassitude  
||  
Latere.

bind and make fast; as, to lash the bonnet to the course, or the drabber to the bonnets; also the carpenter takes care that the spare yards be lashed fast to the ship's side; and in a rolling sea, the gunners mind that the guns be well lashed, lest they should break loose. *Lashers* are properly those ropes which bind fast the tackles and the breechings of the ordnance, when hauled or made fast within-board.

**LASSITUDE**, or **WEARINESS**, in medicine, a morbid sensation, that comes on spontaneously, without any previous motion, exercise, or labour. This is a frequent symptom in acute distempers: it arises either from an increase of bulk, a diminution of proper evacuation, or too great a consumption of the fluids necessary to maintain the spring of the solids, or from a vitiated secretion of that juice.

**LASSUS**, or **LASUS**, a dithyrambic poet, born at Hermione in Peloponnesus about 500 years before Christ. He is reckoned among the wise men of Greece by some. He is particularly known by the answer he gave to a man who asked him what could best render life pleasant and comfortable? Experience. He was acquainted with music. Some fragments of his poetry are to be found in Athenæus. He wrote an ode upon the Centaurs, and an hymn to Ceres, without inserting the letter S in the composition.

**LAST**, in general, signifies the burden or load of a ship. It signifies also a certain measure of fish, corn, wool, leather, &c. A last of codfish, white herrings, meal, and ashes for soap, is twelve barrels; of corn or rapseed, ten quarters; of gunpowder, twenty-four barrels; of red herrings, twenty cades; of hides, twelve dozen; of leather, twenty dickers; of pitch and tar, fourteen barrels; of wool, twelve sacks; of stock-fish, one thousand; of flax or feathers, 1700lb.

**LASTAGE**, or **LESTAGE**, a duty exacted in some fairs and markets, for carrying things bought whither one will. It signifies also the ballast or lading of a ship; and sometimes is used for garbage, rubbish, or such like filth.

**LATERAN** was originally the proper name of a man: whence it descended to an ancient palace in Rome, and to the buildings since erected in its place; particularly a church called *St John of Lateran*, which is the principal see of the popedom.

*Councils of the Lateran*, are those held in the basilica of the Lateran: of these there have been five, held in 1123, 1139, 1179, 1215, and 1513.

*Canons Regular of the Congregation of the Lateran*, is a congregation of regular canons, whereof that church is the principal place or seat.

It is pretended there has been an uninterrupted succession of clerks, living in community from the time of the apostles: and that a number of these were established in the Lateran in the time of Constantine. But the canons were not introduced till the time of Leo I. and these held the church 800 years, till the reign of Boniface, who took it from them, and placed secular canons in their room: 150 years after, the regulars were reinstated.

**A LATERE**, a term used to denote the qualifications of the cardinals whom the pope sends as legates into foreign countries. They are called *legates a latere*, as being his holiness's assistants and counsellors in ordinary. These are the most considerable of the

other three kinds of legates, being such as the pope commissions to take his place in councils; and so called, in regard that he never gives this office to any but his favourites and confidants, who are always *a latere*, at his side. A legate *a latere* has the power of conferring benefices without a mandate, of legitimating bastards to hold offices, and has a cross carried before him as the ensign of his authority.

*De LATERE*, legates who are not cardinals, but yet are entrusted with an apostolical legation. See the article **LEGATE**.

**LATE-WAKE**, a ceremony used at funerals in the Highlands of Scotland. The evening after the death of any person, the relations and friends of the deceased meet at the house, attended by bagpipe or fiddle; the nearest of kin, be it wife, son, or daughter, opens a melancholy ball, dancing, and *greeting* (i. e. crying violently) at the same time, and this continues till daylight; but with such gambols and frolics among the younger part of the company, that the loss which occasioned them is often more than supplied by the consequences of that night. If the corpse remains unburied for two nights, the same rites are renewed. Thus, Scythian like, they rejoice at the deliverance of their friends out of this life of misery.

**LATEEN-SAIL**, a long triangular sail extended by a lateen yard, and frequently used by xebecs, puleacres, fetees, and other vessels navigated in the Mediterranean sea.

**LATH**, in building, a long, thin, and narrow slip of wood nailed to the rafters of a roof or ceiling, in order to sustain the covering.

*LATH-Bricks*, a particular sort of bricks made in some parts of England, of 22 inches in length and 6 in breadth, which are used in the place of laths or spars, supported by pillars in casts, for the drying of malt. This is an excellent contrivance; for besides that they are not liable to fire, as the wooden laths are, they retain the heat vastly better; so that being once heated, a very small quantity of fire will serve to keep them so.

**LATHE**, a very useful engine for the turning of wood, ivory, metals, and other materials. (See **TURNING**) The invention of the lathe is very ancient: Diodorus Siculus says, the first who used it was a grandson of Dædalus, named Talus. Pliny ascribes it to Theodore of Samos; and mentions one Thericles, who rendered himself very famous by his dexterity in managing the lathe. With this instrument the ancients turned all kinds of vases, many whereof they enriched with figures and ornaments in basso relievo. Thus Virgil:

*Lenta quibus torno facili superaddita vitis.*

The Greek and Latin authors make frequent mention of the lathe; and Cicero calls the workmen who used it *vascularii*. It was a proverb among the ancients, to say a thing was formed in the lathe, to express its delicacy and justness.

The lathe is composed of two wooden cheeks or sides, parallel to the horizon, having a groove or opening between; perpendicular to these are two other pieces called *puppets*, made to slide between the cheeks, and to be fixed down at any point at pleasure. These have two points, between which the piece to be turned is sustained; the piece is turned round, backwards.

Latere  
||  
Lathes

backwards and forwards, by means of a string put round it, and fastened above to the end of a pliable pole, and underneath to a trestle or board moved with the foot. There is also a rest which bears up the tool, and keeps it steady.

As it is the use and application of this instrument that makes the greatest part of the art of turning, we refer the particular description thereof, as well as the manner of applying it in various works, to that head. See TURNING.

**LATHRÆA**, in botany: A genus of the angiospermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 40th order, *Personate*. The calyx is quadrifid; there is a depressed glandule at the base of the future of the germen. The capsule is unilocular.

**LATHREVE**, LEIDGRIVE, or TRITHENGREVE, was an officer under the Saxon government, who had authority over a third part of the county; and whose territory was therefore called *trithing*, otherwise a *hid* or *leithin*, in which manner the county of Kent is still divided; and the rapes in Suffex seem to answer to the same. As to the jurisdiction of this officer, those matters that could not be determined in the hundred court, were thence brought to the trithing; where all the principal men of the three or more hundreds being assembled by the *lathreve*, or *trithingreve*, did debate and decide it; or if they could not, then the *lathreve* sent it up to the county court, to be there finally determined.

**LATHYRUS**, CHICKLING: A genus of the decandria order, belonging to the diadelphia class of plants; and in the natural method ranking under the 32d order, *Papilionaceæ*. The stylus is plain, villous above, towards the end broader; the upper two segments of the calyx are shorter than the rest.

*Species*. 1. The latifolius, or everlasting pea, hath thick, fibrous, perennial roots; climbing, thick, branching annual stalks, having membranaceous wings between the joints, rising upon support by their cirri six or eight feet high; diphyllous leaves, of two spear-shaped lobes, terminated by clasps; and numerous large red or purple flowers on long foot stalks, appearing plentifully from June till October, succeeded by abundance of seed. 2. The odorata, or sweet-scented pea, hath a fibrous annual root; a climbing stalk, rising upon support by its clasps three or four feet high; diphyllous leaves of two oval lobes, terminated by climbing tendrils; and flowers by two's on long flower stalks, of different colours in the varieties. 3. The tangitanus, or Tangier-pea, hath a fibrous annual root, a climbing stalk rising upon support for four or five feet high; diphyllous leaves, of two spear-shaped alternate lobes, terminated by tendrils; and from the joints of the stalk large reddish flowers by two's on long foot stalks.

*Culture*. All these species are of hardy growth; and may be propagated by seed in the common ground, in patches where it is designed the plants should flower, for they do not succeed so well by transplantation. They may be sowed in spring; though, if sowed in autumn, the plants will flower earlier the following year.

**LATIAR**, in Roman antiquity, a feast or ceremony instituted by Tarquinius Superbus, in ho-

nour of Jupiter Latiaris or Latialis. — Tarquin having made a treaty of alliance with the Latins, proposed, in order for perpetuating it, to erect a common temple, where all the allies, the Romans, Latins, Hernici, Volsci, &c. should assemble themselves every year, hold a kind of fair, exchange merchandizes, feast, sacrifice, and make merry together. Such was the institution of the Latiar. The founder only appointed one day for this feast; the first consul added another to it, upon concluding the peace with the Latins; and a third was added after the people who had retired to the Mons Sacer were returned to Rome; and a fourth, after appeasing the sedition raised on occasion of the plebeians aspiring to the consulate.

These four days were called the *Latiar feræ*; and all things done during the course of the *feræ*, as feasts, sacrifices, offerings, &c. were called *Latiaræ*.

**LATICLAVE**, (*Laticlavium*), in Roman antiquity, was an honourable distinction, peculiar, in the times of the republic, to the senators; but whether it was a particular kind of garment, or only an ornament upon it, the critics are not agreed: But the more general opinion is, that it was a broad stripe of purple sewed upon the fore-part of their tunic, and round the middle of the breast. There were buttons set on the *lotus clavus* or *laticlave*, which appeared like the heads of large nails, whence some think it derived its name. — The senators, prætors, and chief magistrates of colonies and municipal cities, had a right to wear it. The prætexta was always worn over it; but when the prætor pronounced sentence of death, the prætexta was then put off, and the laticlave retained. The *laticlavium* differed from the *angusticlavium*, but authors do not agree in what respect this difference consisted; the most general opinion seems to be, that the slips or stripes of purple were narrower in the angusticlave.

**LATIMER** (Hugh), bishop of Worcester, was born about the year 1480 at Thureaston in Leicestershire, the only son of a yeoman of that village. At the age of fourteen he was sent to Christ's college, Cambridge; where he applied himself to the study of divinity, and in proper time took the degree of bachelor in that science. At this time he was a zealous Papist, and was honoured with the office of keeper of the cross to the university; but when he was about thirty years of age, he became a convert to the Protestant religion; and being now one of the twelve licensed preachers from Cambridge, he promulgated his opinions with great freedom. It was not long before he was accused of heresy; and being summoned before cardinal Wolsey, was obliged to subscribe certain articles of faith, which he certainly did not believe. About the year 1529 he was presented by the king to the rectory of Westkinton in Wiltshire; to which place, after residing some time at court with his friend and patron Dr Butts, he retired; but, resuming his former invectives against the Popish doctrines, he was again summoned to answer certain interrogatories, and again obliged to subscribe. In 1535 he was promoted to the bishopric of Worcester; in the possession of which dignity he continued till the year 1539, when, rather than assent to the act of the six articles, he resigned his mitre, and retired into the country; but was in a short time accused of speaking against the six articles,

Laticlave,  
Latimer.

Latimer,  
Latin.

articles, and committed to the Tower, where he continued prisoner till the death of Henry VIII. which happened in January 1547. On the accession of Edward VI. Latimer was released, but not restored to his bishopric, though he preached several times before the king, and continued to exercise his ministerial function with unremitting zeal and resolution. Young Edward, alas! finished his short reign in 1553; and Mary, of infamous memory, ascending the throne, poor Latimer was immediately doomed to destruction, and, together with Craumer and Ridley, confined in the Tower. In April 1554, they were removed to Oxford, that they might dispute with the learned doctors of both universities. Latimer declining the disputation on account of his great age and infirmities, delivered his opinion in writing; and refusing to subscribe the Popish creed, was condemned for heresy; and in October following was, together with bishop Ridley, burnt alive. He behaved with uncommon fortitude on the occasion, and died a real martyr to the Reformation. His general character is that of a learned, virtuous, and brave man. His works are, 1. Sermons, 1635, fol. 2. Letters; in Fox's Acts and Monum. vol. ii. fol. 1580. 3. An injunction to the prior and convent of St Mary's in Worcestershire. See record at the end of Burnet's History of the Reformation, part ii. p. 293.

LATIN, a dead language, first spoken in Latium, and afterwards at Rome; and still used in the Romish church, and among many of the learned.

This language is principally derived from the Greek, and particularly from the Eolic dialect of that tongue, though it has a great number of words which it borrowed from the languages of the Etrusci, Oscei, and other ancient people of Italy; and foreign commerce and wars, in course of time, added a great many more.

The Latin is a strong nervous language, perfectly suitable to the character of the people who spoke it; we have still works of every kind admirably well written in the Latin, though there are vast numbers lost.

The Latin tongue was for a while confined almost wholly within the walls of Rome; nor would the Romans allow the common use of it to their neighbours, or to the nations they subdued: but by degrees they in time became sensible of the necessity of its being generally understood for the convenience of commerce; and accordingly used their endeavours, that all the nations subject to their empire should be united by one common language; so that at length they imposed the use of it by a particular law for that purpose. After the translation of the seat of the empire from Rome to Constantinople, the emperors of the east, being always desirous of retaining the title of Roman emperors, appointed the Latin to be still used; but at length neglecting the empire of the west, they abandoned all care of the Latin tongue, and used the Greek. Charlemagne coming to the empire of the west, revived this language; but at length it gave way, and the French took place of the Latin: it was, however, prodigiously degenerated before it came to be laid aside, in which condition it was found at the time of the Reformation, when Vives, Erasmus, &c. began to open the way for its recovery: since which time the monkish latinity has

been declining, and all endeavours have been used to retrieve the pure language of the Augustan age. See LANGUAGE.

LATIN-*Church.* See CHURCH.

LATINS, an ancient nation of Italy. See LATIUM.

LATINUS, king of the Latins in Italy, was the son of Faunus; and, it is said, began to reign about the 1216th year before the Christian era. Lavinia, his only daughter, married Æneas, after that Trojan prince had killed Turnus king of the Rutuli. See ROME.

LATISSIMUS, in anatomy, the name of several muscles. See ANATOMY, *Table of the Muscles.*

LATITUDE, in astronomy, is the distance of a star north or south from the ecliptic. In geography it signifies the distance of any place north or south, from the equator. See ASTRONOMY and GEOGRAPHY, *passim.*

LATITUDINARIAN, a person of moderation with regard to religious opinions, who believes there is a latitude in the road to heaven, which may admit people of different persuasions.

LATIUM (anc. geog.), the country of the Latins, at first contained within very narrow bounds, but afterwards increased by the accession of various people. The appellation, according to Virgil, is a *latendo*, from Saturn's lying hid there from the hostile pursuits of his son Jupiter; and from *Latium* comes the name *Latini*, the people, (Virgil): though Dionysius Halicarnassæus derives it from king Latinus, who reigned about the time of the Trojan war. But whatever be in this, it is certain, that Latium, when under Æneas and his descendents, or the Alban kings, contained only the Latins, exclusive of the Æqui, Volsci, Hernici, and other people; only that Æneas reckoned the Rutuli, after their conquest, among the Latins. And this constituted the ancient *Latium*, confined to the Latins: but afterwards, under the kings, and after their time, it reached from the Tiber to Circeii. Under the consuls, the country of the Equi, Volsci, Hernici, &c. after long and bloody wars, was added to Latium, under the appellation *adjectitious* or *superadded Latium*, as far as the river Liris, the eastern boundary, and to the north as far as the Marii and Sabines. The various people, which in succession occupied Latium, were the Aborigines, the Pelasgi, the Arcades, the Siculi, the Arunci, the Rutuli; and beyond Circeii, the Volsci, the Oscei, the Ausones: but who first, who next, occupied the country, it is difficult to say.

LATMUS (anc. geog.), a mountain of Ionia, or on the confines of Caria, famous for the fable of Endymion, of whom the Moon was said to be enamoured: hence called *Latmius Heros*, and *Latmius Venator*. In the mountain was a cave in which Endymion dwelt (Scholiast on Apollonius Rhodius). Supposed by Hecateus to be the *Phibeiron Mons* of Homer; but by others to be *Grius Mons*, nor far from Latmus (Strabo.)

LATOMIA, properly signifies a *stone quarry*: But the places whence stones had been dug having been made use of sometimes as dungeons, jails, or prisons for criminals, it is oftentimes applied as a name for

ona  
ite. for a prison. There was a place of confinement of this sort at Rome, near the Thullianum; another at Syracuse, in which Cicero says Verres had shut up Roman citizens.

LATONA, in mythology, a pagan goddess, whose history is very obscure. Hesiod makes her the daughter of Titan Coeus and Phoebe his sister. She was admired for her beauty, and celebrated for the favours which she granted to Jupiter. Juno, always jealous of her husband's amours, made Latona the object of her vengeance, and sent the serpent Python to disturb her peace and persecute her. Latona wandered from place to place in the time of her pregnancy, continually alarmed for fear of Python. She was driven from heaven; and Terra, influenced by Juno, refused to give her a place where she might rest and bring forth. Neptune, moved with compassion, struck with his trident and made immovable the island of Delos, which before wandered in the Ægean, and appeared sometimes above, and sometimes below, the surface of the sea. Latona, changed into a quail by Jupiter, came to Delos; where she resumed her original shape, and gave birth to Apollo and Diana, leaning against a palm tree or an olive. Her repose was of short duration: Juno discovered the place of her retreat, and obliged her to fly from Delos. She wandered over the greatest part of the world; and in Caria, where her fatigue compelled her to stop, she was insulted and ridiculed by the peasants of whom she asked for water while they were weeding a marsh. Their refusal and insolence provoked her, and she intreated Jupiter to punish their barbarity. They were all changed into frogs. She was also insulted by Niobe; who boasted herself greater than the mother of Apollo and Diana, and ridiculed the presents which the piety of her neighbours had offered to Latona. At last, Latona, though persecuted and exposed to the resentment of Juno, became a powerful deity, and saw her children receive divine honours. Her worship was generally established where her children received adoration; particularly at Argos, Delos, &c. where she had temples. She had an oracle in Egypt, celebrated for the true and decisive answers which it gave. Latona, Venus, and Diana, were the three goddesses most in veneration among the Roman women.

LATRIA, in theology, a religious worship due only to God. See ADORATION.

The Romanists say, "They honour God with the worship of *latria*, and the saints with the worship of *dulia*." But the terms, however distinct, are usually confounded.

The worship of *latria*, besides its inner characters, has its external marks to distinguish it; the principal whereof is sacrifice, which cannot be offered to any other but God himself, as being a solemn acknowledgment or recognition of the sovereignty of God, and our dependence on him.

Mr Daille seems to own, that some of the fathers of the fourth century allowed the distinction between *latria* and *dulia*.

LATRINÆ, were public houses of office, or necessaries, amongst the Romans. We do not find, in the writings or buildings that remain of antiquity, that they had any privies in their dwellings. The latrinæ

were public places where the slaves washed and emptied their master's clove-stools. We are pretty well assured that the Romans had public places of convenience, which were covered over, and had a sponge hanging up in them for cleanliness. Rich men had clove-stools, which were taken away occasionally to the common shores.

LATRUNCULI, a game amongst the Romans, of much the same nature with our chess. The *latrunculi* were properly the chess-men, called also *latrones* and *calculi*. They were made of glass, and distinguished by black and white colours. Sometimes they were made of wax or other convenient substances. Some give the invention of this game to Palamedes when at the siege of Troy; Seneca attributes it to Chilon, one of the seven Grecian sages; others honour Pyrrhus with the invention; and others again contend that it is of Persian origin—but is not this *Lis de lana caprina*? Frequent allusions to this game are met with in the Roman classics, and a little poem was wrote upon it addressed to Piso, which some say was the work of Ovid, others of Lucan, in the end of some editions of whose works it is to be found, and to which we refer for a fuller account of the game. This game expresses so well the chance and order of war, that it is, with great appearance of probability, attributed to some military officer as the inventor. One Canius Julius was so exceedingly fond of chess, that after he was sentenced to death by Caligula, he was found playing, but interrupted in his game by a call to execution; he obeyed the summons, but first desired the centurion who brought the fatal order, to bear witness that he had one man upon the board more than his antagonist, that he might not falsely brag of victory when he should be no more.

LATTEN denotes iron-plates turned over, of which tea-cannillers are made.

Plates of iron being prepared of a proper thinness; are smoothed by rusting them in an acid liquor, as common water made eager with rye. With this liquor they fill certain troughs, and then put in the plates, which they turn once or twice a-day, that they may be equally rusted over. After this they are taken out, and well scoured with sand; and, to prevent their rusting again, are immediately plunged into pure water, in which they are to be left till the instant they are to be tinned or blanchèd; the manner of doing which is this: They flux the tin in a large iron crucible, which has the figure of an oblong pyramid with four faces, of which two opposite ones are less than the two others. The crucible is heated only from below, its upper part being luted with the furnace all round. The crucible is always deeper than the plates which are to be tinned are long; they always put them in downright, and the tin ought to swim over them; to this purpose artificers of different trades prepare plates of different shapes, though Mr Reaumur thinks them all exceptionable. But the Germans use no sort of preparation of the iron to make it receive the tin more than the keeping it always steeped in water till the time; only when the tin is melted in the crucible, they cover it with a layer of a sort of fuel, which is usually two inches thick, and the plate must pass through this before it can come to the melted tin. The first use

Latrunculi,  
Latten.

Latten  
H  
Lava.

of this covering is to keep the tin from burning; for if any part should take fire, the fuel would soon moisten it, and reduce it to its primitive state again. The blanchers say, this fuel is a compounded matter. It is indeed of a black colour; but Mr Reaumur supposed that to be only an artifice to make it a secret, and that it is only coloured with soot or the smoke of a chimney: but he found it true so far, that the common unprepared fuel was not sufficient; for after several attempts, there was always something wanting to render the success of the operation certain. The whole secret of blanching, therefore, was found to lie in the preparation of this fuel; and this at length he discovered to consist only in the first frying and burning it. This simple operation not only gives it the colour, but puts it into a condition to give the iron a disposition to be tinned, which it does surprisngly.

The melted tin must also have a certain degree of heat: for if it is not hot enough, it will not stick to the iron; and if it is too hot, it will cover it with too thin a coat, and the plates will have several colours, as red, blue, and purple, and upon the whole will have a cast of yellow. To prevent this, by knowing when the fire has a proper degree of heat, they might try with small pieces of iron; but in general, use teaches them to know the degree, and they put in the iron when the tin is at a different standard of heat, according as they would give it a thicker or thinner coat. Sometimes also they give the plates a double layer, as they would have them very thickly covered. This they do by dipping them into the tin when very hot the first time, and when less hot the second. The tin which is to give the second coat must be fresh covered with fuel; and that with the common fuel, not the prepared.

*LATTEN-Brass*, plates of milled brass reduced to different thickness, according to the uses they are intended for.

*LATTIMO*, in the glass-trade, a name for a fine milk-white glass. There are several ways of making it, but the best of all is this: take 400 weight of crystal frit, and 60 pounds of calcined tin, and two pounds and a half of prepared manganese; mix these well with the frit, and set them in a pot in a furnace to melt and refine. At the end of 18 hours this will be purified; then cast it into water, purify it again afterwards in the furnace, and make a proof of it. If it be too clear, add 15 pounds more of calcined tin; mix it well with the metal, and let it stand one day to purify; it will then be of a whiteness surpassing even that of snow, and is fit to work into vessels.

*LAVA*, a stream of melted minerals which runs out of the mouths, or bursts out through the sides of burning mountains during the time of an eruption. See *ÆTNA*, *VESUVIUS*, *HECLA*, *VOLCANO*, &c.

The lava at its first discharge is in a state of prodigious ignition, greatly superior to any thing we can have an idea of from the small artificial furnaces made by us. Sir William Hamilton informs us, that the lava of Vesuvius, at the place whence it issued (in the year 1767), "had the appearance of a river of red-hot and liquid metal, such as we see in the glass-houses, on which were large floating cinders half lighted, and rolling over one another with great precipitation down the side of the mountain, forming on

the whole a most beautiful and uncommon cascade." Now, if we consider the materials of which the lava consists, which undoubtedly are the common matters to be found every where in the earth, namely, stones, metallic ores, clay, sand, &c. we shall find that our hottest furnaces would by no means be able to bring them into any degree of fusion; since the materials for glass cannot be melted without a great quantity of very fusible salts, such as alkalies, nitre, &c. mixed along with them. The heat of a volcano must therefore be immense: and besides its heat, it is sometimes attended with a very uncommon circumstance; for Sir William Hamilton informs us, that "the red-hot stones thrown up by Vesuvius on the 31st of March 1766 were perfectly transparent;" and the like remark he makes on the vast stream of lava which issued from this volcano in 1779: (See *VESUVIUS*). This we cannot look upon to be the mere effect of heat: for mere heat with us will not make a solid body transparent; and these stones, we are sure, were not in a state of fusion, or the resistance of the air would have broke them all to pieces, even supposing them, which is very improbable, to have been in that state detached from the rest of the lava. For the transparency, therefore, we must have recourse to electricity; which in some of our experiments hath the property of rendering opaque bodies transparent\*. Indeed it is scarce possible but the lava and every other matter thrown out of a volcano must be in the highest degree electrical, seeing the fire itself most probably takes its rise from electricity, as is shown under the article *VOLCANO*.

The lava, after having once broke out, does not constantly continue running from the same vent, but often has intermissions, after which it will burst out sometimes at the same place, and sometimes at another. No real flame ever appears to come from the lava. In the day-time its progress is marked by a thick white smoke, from which the light of the red hot matter being reflected in the night-time, makes it appear like flame. But if, during its progress, it meets with trees or other combustible substances, which it frequently does, a bright flame immediately issues from its surface, as hath also been remarked by Sir William Hamilton.—This liquid substance, after having run pure for about 100 yards (more or less, no doubt, according to different circumstances), begins to collect cinders, stones, and a scum is formed on the surface. Our author informs us, that the lava which he observed, with its scum, had the appearance of the river Thames, as he had seen it after a hard frost and a great fall of snow, when beginning to thaw, carrying down vast masses of snow and ice. In some places it totally disappeared, and ran in a subterraneous passage formed by the scum for several paces; after which it came out pure, having left the scum behind, though a new one was quickly formed. This lava at the farthest extremity from its source did not appear liquid, but like a heap of red-hot coals, forming a wall in some places 10 or 12 feet high, which rolling from the top soon formed another wall, and so on.—This was the appearance also put on by the lava which issued in the great eruption of 1783 in Iceland; with this difference, that the wall was at one time 210 feet high, and the general thickness of it was more than 100: (See *HECLA*). While a lava is in this state, Sir Wil-

va. liam is of opinion, that it is very practicable to divert it into another channel, in a manner somewhat similar to what is practised with rivers. This he was afterwards told had been done with success during the great eruption of Etna in 1669: that the lava was directing its course towards the walls of Catania, and advancing very slowly, when they prepared a channel for it round the walls of the town, and turned it into the sea. A succession of men, covered with sheep skins wetted, were employed to cut through the tough flanks of lava, till they made a passage for that in the centre, which was in perfect fusion, to disgorge itself into the channel prepared for it. But this, it is evident, can only take place in small streams of this burning matter; with that above mentioned it would have been impossible. It hath been also observed of the lavas of Etna, that they do not constantly fall down to the lowest places, but will sometimes ascend in such a manner as to make the valleys rise into hills. On this Sir William Hamilton has the following note: "Having heard the same remark with regard to the lavas of Vesuvius, I determined, during an eruption of that volcano, to watch the progress of a current of lava, and I was soon enabled to comprehend this seeming phenomenon, though it is, I fear, very difficult to explain. Certain it is, that the lavas, while in their most fluid state, follow always the laws of other fluids; but when at a great distance from their source, and consequently encumbered with scoriæ and cinders, the air likewise having rendered their outward coat tough, they will sometimes (as I have seen) be forced up a small ascent, the fresh matter pushing forward that which went before it, and the exterior parts of the lava acting always as conductors (or pipes, if I may be allowed the expression) for the interior parts, that have retained their fluidity from not being exposed to the air."

From the year 1767 to 1779, this gentleman made many curious observations on the lavas of Vesuvius. He found, that they constantly formed channels in the mountain as regular as if they had been made by art; and that, whilst in a state of perfect fusion, they continued their course in those channels, which were sometimes full to the brim, and at others more or less so according to the quantity of matter thrown out. These channels, after small eruptions, were generally from two to five or six feet wide, and seven or eight in depth. They were often hid from the sight by a quantity of scoriæ that had formed a crust over them, and the lava, having been conveyed in a covered way for some yards, came out again fresh into an open channel. Our author informs us, that he had walked in some of these subterraneous galleries, which were exceedingly curious, the sides, top, and bottom, being exceedingly smooth and even: others were incrustated with what he calls very extraordinary scoriæ, beautifully ramified white salts in the form of dropping stalactites, &c.

On viewing a stream of lava while in its fluid state in the month of May 1779, he perceived the operation of it in the channels above described in great perfection. After quitting them, it spread itself in the valley, and ran gently like a river that had been frozen, and had masses of ice floating upon it. The wind happening then to shift, our traveller was so incommoded by the smoke, that the guide proposed to cross

it, which was instantly put in execution without any other inconvenience than the violent heat with which the legs and feet were affected. The crust was so tough, that their weight made no impression upon it, and the motion so slow that they were in no danger of falling. This circumstance, according to Sir William, points out a method of escape should any person happen to be inclosed betwixt two lavas, but ought never to be tried except in cases of real necessity; and indeed, if the current of melted matter was very broad, must undoubtedly be attended with extreme danger, both from the heat of the upper crust and the chance of its breaking and falling down with the passenger into the burning liquid below. That which Sir William Hamilton crossed was about 50 or 60 feet broad.

Having passed this burning stream, our travellers walked up along the side of it to its very source. Here they saw it boiling and bubbling violently up out of the ground, with a hissing and crackling noise like that which attends the playing off an artificial fire-work. An hillock of about 15 feet high was formed by the continual splashing up and cooling of the vitrified matter. Under this was an arched hollow, red-hot within, like an heated oven; the lava which ran from it being received into a regular channel raised upon a sort of wall of scoriæ and cinders, almost perpendicularly, of about the height of 8 or 10 feet, and much resembling an ancient aqueduct. On quitting this fountain of lava, they went quite up to the crater, where as usual they found a little mountain throwing up stones and red-hot scoriæ with loud explosions; but the smoke and smell of sulphur was so intolerable, that they were obliged to quit the place with precipitation.

By the great eruption in August 1779, the curious channels above mentioned were entirely destroyed, the cone of the mountain was covered with a stratum of lava full of deep cracks, from whence continually issued a sulphureous smoke that tinged the scoriæ and cinders with a deep yellow, or sometimes white tint. The lava of this eruption appeared to be more perfectly vitrified than that of any former one he had observed. The pores of the fresh lava were generally full of a perfect vitrification, and the scoriæ themselves, viewed through a magnifying glass, appeared like a confused heap of filaments of a foul vitrification. When a piece of the solid lava had been cracked in its fall, without separating entirely, fibres of perfect glass were always observed reaching from side to side within the cracks. The natural spun glass which fell in some places along with the ashes of this eruption, and which has likewise been observed in other places, he is of opinion must have proceeded from an operation of the kind just mentioned; the lava cracking and separating in the air at the time of its emission from the crater, and by that means spinning out the pure vitrified matter from its pores or cells; the wind at the same time carrying off the filaments of glass as fast as they were produced.

Our author observed a kind of pumice-stone sticking to some very large fragments of the new lava. On close inspection, however, he found that this substance had been forced out of the minute pores of the solid lava itself; and was a collection of fine vitreous fibres or filaments confounded together at the time of

Lava.

their being pressed out by the contraction of the large fragments of lava in cooling, and which had been bent downwards by their own weight. "This curious substance (says he) has the lightness of a pumice, and resembles it in every respect, except that it is of a darker colour."

When the pores of this lava were large, and filled with pure vitrified matter, the latter was sometimes found blown into bubbles on the surface; probably by the air which had been forced out at the time the lava contracted itself in cooling; and from these thin bubbles it appeared, that this kind of volcanic glass has much the same transparency with our common glass bottles, and like them is of a dirty yellow colour; but when large pieces of it were broken off with a hammer, they appeared perfectly black and opaque.

In the lava of this eruption it was observed, that many detached pieces were in the shape of a barley-corn or plum stone, small at each end, and thick in the middle. Some of these did not weigh above an ounce; but others could not be less than 60 pounds. Our author took them to be drops from the liquid fountain of fire, which might naturally acquire such a form in their fall. There were also many other curious vitrifications, different from any he had seen before, mixed with this huge shower of scoria and masses of lava.

In treating of Mount Etna, M. Houel makes mention of a piece of lava which, after having been once ejected by the volcano, was swallowed up, and thrown out a second time. The intense heat to which it was then subjected, had such an effect upon it, that it appeared all full of chinks to a considerable depth, and which run at right angles to one another. He had also an opportunity of observing to great advantage some of the hollow channels formed by the lavas of Etna similar to those described by Sir William Hamilton, but on a much larger scale. Here the great eruption of water in 1755 had overturned, in a vertical direction, an huge tube of this kind for the length of half a mile. The tube itself appeared to be composed of enormous masses, somewhat resembling planks; each two feet thick and twelve or fifteen in breadth, continued in a straight line through the whole of that space. At the same time by the action of the lava a kind of walls had been formed, from ten to sixteen feet in height, and curved at the top. Some of these walls appear rolled together like paper; and M. Houel is of opinion, that these various appearances on the surface of the lava when cooled must have arisen from particles heterogeneous to the real lava; and which detach themselves from it, rising to the surface under a variety of forms proportioned to the spaces of time taken up in cooling. These crusts are formed of different kinds of scoria and dirty lava, mixed with sand or ashes. At the same place are found also great numbers of small pieces like those of ice heaped upon one another after having floated for some time on a river. Beneath these the pure lava is met with, and which has evidently been in a state of perfect fusion. This is extremely dense; and by looking narrowly into its chinks, the composition of the whole appears to be merely homogeneous. "It is curious (says he) to observe, so near one species of lava which is very pure, another which has likewise

arrived at the same place in a fluid state, and has there undergone so great a change as scarce to retain an appearance of its original state. It is, however, like iron dross, in grains of unequal sizes. We find it also at various distances, such as one, two, or more hundred fathoms. It is sometimes found in large pieces like tables, covered over with sharp points, some longer and others shorter. All these pieces are quite detached from one another, as if they had been brought thither and scattered from a tumbril. The matter of which the crust of the lava is formed, seems to have issued from it in the same manner in which froth rises upon solution of soap in water. It appears afterwards to have swelled, burst, and assumed its present form, presenting to the view various spaces filled with small loose stones. A great number of new lavas were likewise observed, all of them putting forth various kinds of efflorescences in great quantity.

The hardness, density, and solidity, of lavas, no doubt proceed from the degree of heat to which they have been exposed, and which seems to be greater or less according to their quantity. Hence the Icelandic volcanoes, which pour forth the greatest quantities of lava, produce it also in the greatest degree of liquefaction, and Dr Van Troil observes, that what he saw must have been liquefied to an extreme degree.

The composition of the lavas of different volcanoes, and even of different parts of those of the same volcano, is extremely different. Sir William Hamilton is of opinion that this difference in composition contributes not a little to the facility or difficulty with which they afterwards receive earth capable of vegetation. "Some (says he) have been in a more perfect state of vitrification than others, and are consequently less liable to the impressions of time. I have often observed on Mount Vesuvius, when I have been close to a mouth from whence the lava was disgorging itself, that the quality of it varied greatly from time to time. I have seen it as fluid and coherent as glass when in fusion; and I have seen it farinaceous, the particles separating as they forced their way out, just like meal coming from under the grindstones. A stream of lava of this sort being less compact, and containing more earthy particles, would certainly be much sooner fit for vegetation than one composed of the more perfect vitrified matter." Mr Bergman, who has accurately analysed some Icelandic lavas, informs us, that one kind is very coarse, heavy, and hard, full of bladders, almost black, intermixed with white grains resembling quartz, which in some places have a figure not very unlike a square. This black matter is not attracted by the magnet; but if a piece of it is held against a compass, the needle visibly moves. When tried in the crucible, it yields from ten to twelve pounds of iron in every hundred weight. It does not dissolve in the least with sal sodæ, and very difficultly with borax, and scarce at all with urinous salt. It seems to contain a great deal of clay in its composition, which may be extracted by all acid solvents. This last he is likewise, from experiments, assured is the case with the lava of Solfaterra in Italy.

The white lava, which possesses more or less of those transparent grains or rays with which lavas are generally chequered, does not seem to be of the nature of quartz, as it cannot be attacked by sal sodæ; it is

however, soluble with some difficulty by borax and fusible urinous salt, or microcosmic acid. These effects are perfectly similar to those produced upon the diamond, ruby, sapphire, topaz, and hyacinth. The chrysolite, garnet, tourmalin, and flint, can neither be dissolved by sal sodæ, though they are somewhat attacked by it when reduced to a fine powder; and upon the two last mentioned ones it produces a slight effervescence; on which account, says Mr Bergman, it is possible that the precious stones found upon Mount Vesuvius, which are sold at Naples, are nearer related to the real precious stones than is generally imagined. He found no such grains in a finer kind of lava, quite porous within, and entirely burnt out, and considerably lighter than the former ones.

The Iceland agate is of a black or blackish brown colour, a little transparent at the thin edges like glass, and gives fire with steel. It cannot easily be melted by itself; but becomes white, and flies in pieces. It can hardly be dissolved in the fire by fusible urinous salt; but it succeeds a little better with borax, though with some difficulty. With sal sodæ it dissolves very little; though in the first moments some ebullition is perceived, and the whole mass is afterwards reduced to powder. Hence Mr Bergman concludes, that this agate hath been produced by an excessive fire out of the black lava formerly mentioned.

In the Iceland pumice-stone, quartz and crystals are often found, particularly in the black and reddish-brown kind. The stones thrown out of the volcano, whether grey, or burnt brown, seemed to consist of a hardened clay, mixed with a siliceous earth. They were sprinkled with rays and grains resembling quartz, and some few flakes of mica. They fused with great difficulty in the fire; with sal sodæ they showed some effervescence at first, but which ceased in a short time. The parts resembling quartz produced no motion at all; from whence Mr Bergman concludes, that the black lava already mentioned proceeds principally from this mass. Several other stones which were sent him from Iceland, Mr Bergman supposed to have no connection with the eruptions, but to have been produced in some other way.

In Mr Ferber's travels through Italy, we are informed, that he has seen a species of lava so exactly resembling blue iron slags, that it was not to be distinguished from them but with great difficulty. The same author tells us likewise, that "the Vicentine and Veronese lavas and volcanic ashes contain inclosed several sorts of fire-striking and flint-horn stones, of a red, black, white, green, and variegated colour, such as jaspers and agates; that hyacinths, chrysolites, and *pietre oliviane*, described by Mr Arduini in his *Giornale d'Italia*, are found at Leonedo; and that chalcedony or opal pebbles, and noduli with inclosed water-drops, (*chalcedonii opali enhydri*), are dug out of the volcanic cineritious hills near Vicenza.

M. Dolomieu considers the chemical analysis of lava as but of little account. When subjected to the force of fire a second time, they are all of them reducible to the same kind of glass; from which it has been concluded, that all volcanic products have been formed of the same kind of materials, and that the subterraneous fire has always acted on and variously modified the same kind of stone. But an analysis by fire,

he justly observes, is of all others the most fallacious. The substances are all fusible, and we have no proper methods of measuring the intensity of our fire; so that the same substance which to-day may come out of our furnaces untouched, may to-morrow be found completely altered, even though the fire employed should not appear to us to be any more violent than the former. Analysis by different menstrua have not been more successful. Mr Bergman has indeed analysed some lavas with acids, and gives with astonishing precision the following result, viz. that an hundred parts of lava contain 49 of siliceous earth, 35 of argillaceous earth, four of calcareous earth, and 12 of iron. These experiments, however, our author observes, give us no information with regard to lavas in general. They only show the composition of the particular specimens that he tried; and even after the descriptions that he has given, we are a good deal at a loss to discover the species of lava which he subjected to analysis. "It would be as ridiculous (says M. Dolomieu) to apply this analysis to every volcanic product, as it would be to believe that the component parts of a fissile rock were the same with those of every rock composed of laminae or thin strata." For these reasons he is of opinion, that, in order to understand the nature of lavas, we should consider not only that of volcanoes themselves, but of the bases on which they rest.

Had this been done, we would have found that the volcanic fires generally exist in beds of argillaceous schistus and horn stone; frequently in a species of porphyry, the gluten of which is intermediate between horn-stone and petrosilex; containing a large quantity of schorl, feldt-spar, and greenish quartz or chrysolite, in little rounded nodules. These substances, he tells us, would have been found in those mountains which are called primitive, and in strata buried under beds of calcareous stone; and, among other things, would have convinced us, that the fluidity of lavas does not make them lose the distinctive characters of their bases. In the mountains called *Primitive*, those rocks which are assigned as the bases of the more common lavas are found intermixed with micaceous ones, with gneiss, granite, &c. and they generally rest on masses of granite. Hence lavas must consist of all these matters, and the fire must act upon them all whenever it meets with them. Our author has constantly observed, that volcanoes situated at the greatest distance from the centre of the chain, or group of mountains on which they are established, produce lavas of a more homogeneous composition, and less varied, and which contain most iron and argillaceous earth. Those, on the contrary, placed nearer the centre, are more diversified in their products; containing substances of an infinite variety of different kinds. The heat of the fire, however, he observes, does not long continue among the granites, the inflammation being either extinguished, or returning to the centre of the schistus rocks in its neighbourhood.

From this knowledge of the materials of which lavas are composed, we acquire also a considerable knowledge of the matters that are found in greatest quantity in the bowels of the earth. The excavations made by mines, &c. on the surface of the earth, are mere scratches in comparison of the depths of volcanic fires; and as he considers the mountains themselves as the

productions of those fires, it thence follows, that by attentively examining the materials of which they are composed, we may thence determine what kind of substances are most common at these great depths in the earth.

Thus our author thinks it probable, that schists and porphyries, though rare on the surface, are very common in the internal parts of the earth. As an instance of the truth of his observations, our author informs us, that he was convinced, from no other circumstance but merely inspecting the lavas of Mount Etna, that, in some parts of the island of Sicily, there existed granites, porphyries, with schistus and argillaceous hornstones. In this opinion he persisted, notwithstanding the generally opposite sentiments of the inhabitants themselves. He searched in vain three-fourths of the island; and at last found that all the mountains, forming the point of Sicily, called *Pelorus*, contain rocks of the kind above mentioned. He then saw that the base of these mountains was produced under Mount Etna on one side, and under the Lipari islands on the other. "We must, therefore, (says he) believe, that these mountains have furnished the materials on which the volcanoes have, for thousands of years, exerted their power."

By travelling among those elevations called the *Neptunian Mountains*, or *Mont Pelorus*, he was enabled to discover the reason why the products of Etna and the Lipari islands differ from one another. This, he says, is the unequal distribution of the granite and schistus rocks among them. The islands rest almost immediately on the granite, or are separated from it by a very thin stratum of argillaceous rock which contains porphyry; but the Sicilian volcano is situated on the prolongation of the schistous rock, which it must pierce before it reaches the granite; and accordingly very little of its lava seems to have granite for its basis. If the seat of the fire was still more distant from the centre of the mountains, their lavas would be more homogeneous; because the schist, which succeeds to the hornstone, is less various, and hardly includes any bodies foreign to its own substance. Thus the lavas, in the extinguished volcanoes of the *Val di Noto*, which lie 15 leagues to the south-east of Etna, contain neither granite nor porphyry; but have for their bases simple rocks, with particles of chrysolite and some schists.

To the granites which extend to Metazzo, opposite to Lipari, he ascribes the formation of pumice; as they contain an immense quantity of scaly and micaceous rocks, black and white, with fossil granites or *gneiss*, the basis of which is a very fusible feldt-spar; and these he supposes to be the proper materials of the pumice, having found pieces of them almost untouched in pumice-stones. There are beds of almost pure feldt-spar; to the semivitrification of which he ascribes an opaque enamel like lava mentioned in other parts of his works. Few porphyries, however, he acknowledges, are to be met with among the Neptunian mountains, though these stones abound in the lavas of Etna. "They are not distant (says he) from the granites; and those I have found have neither the hardness nor perfection of those pieces which I gathered in the gullies, and which had been apparently washed out of the anterior parts of the mountain by water.

But though the porphyries I saw here bear no proportion to those in the products of Etna, I was sufficiently convinced of their existence, and their analogy with those of volcanoes, by discovering that the centre of these mountains contains a great number of them. Porphyries, in general, are very rare on the surface of the earth. Nature generally conceals them from us by burying them under calcareous strata, or by inclosing them in schistus rocks with which they are almost always mixed: but we are indebted to the labour of volcanoes for informing us that they are among the most common substances in the bowels of the earth; and they are never so much disguised by the subterranean fire as to be mistaken in the lavas of which they form the basis."

In Cronstedt's Mineralogy we find all the volcanic products classed under the general name of *Slags*; of which he enumerates the following species.

1. *The Achates Islandicus Niger*, or Iceland Agate. It is black, solid, and of a glassy texture; but in thin-pieces: it is greenish, and semitransparent, like bottle-glass which contains much iron. It is found in Iceland and in the island of Ascension. The jewellers employ it as an agate, though it is too soft to resist the wear. "The most remarkable thing concerning this (says he) is, that such large solid masses are found of it, that there is no possibility of producing the like in any glass-house. In Magellan's notes on this subject, we find the Iceland agate classed among the transparent basaltes. To the same class belong the *Lapis Obsidianus* of Pliny, and the *Lapis Gallinaceus* of Peru, which by its beautiful blackness approaches to the colour of a large black-bird of the crow kind, in that country called the *Gallinago*."

2. *Lapis molaris Rhenanus*, Rhenish Millstone, is blackish-grey, porous, and perfectly resembling a sort of slag produced by Mount Vesuvius.

3. *Pumex*, the pumice-stone. See PUMEX.

4. The Pearl-Slag is compounded of white and greenish glass particles, which seem to have been conglutinated while yet soft or in fusion. It is found in the island of Ascension.

5. Slag sand, or ashes, thrown out by volcanoes in larger or smaller grains. "This (says Cronstedt) may perhaps be the principle of the Terra Puzzolana, because such an earth is said at this time to cover the ruins of Herculaneum near Naples, which was destroyed by Vesuvius." In the notes, we are informed, that if the ashes of a volcano be plentifully moistened, they produce that kind of *tufa* or *tophi*, *traas*, and *pori*, all of which are nearly of the same kind. Great heaps of *tufa* or *tophi* are found in Italy, forming various hills, and covering large tracts of land; from whence it is cut, and carried, for making the walls, vaults, and upper ceilings of houses. It is a very soft kind of stone, extremely advantageous for these purposes, on account of its little weight, and being easily cut into any form. The inhabitants of Umbria and other parts of Italy dig with very little labour various subterranean excavations for the keeping of wines and provisions of different kinds.

Mr Kirwan is of opinion, that the lavas ought to be distinguished from the other volcanic productions. All lavas, according to him, are magnetic, give fire with steel, are generally of a granular texture, and fusible

*per se.* They may be reduced to three varieties, *viz.* the Cellular, the Compact, and the Vitreous. The cellular appear to have undergone only the first degree of fusion, being just mollified and heated sufficiently to expel the fixed air contained in the argillaceous particles. Hence they abound in small cavities arising from the expansion of that air after it had recovered its elastic state; and thus they are often so light as to float upon water, and have been mistaken for pumice-stones. They are of black, grey, brown, or reddish colours; and their cavities are even filled with crystallizations. Of this kind is Cronstedt's second species, the millstone of the Rhine. These contain from 45 to 50 *per cent.* of siliceous earth; from 15 to 20 of iron; four or five of pure calcareous earth; the remainder being argillaceous.

The compact lavas have undergone a more perfect degree of fusion, though even these are not destitute of cavities. They contain finer crystals, or such as are more completely vitrified than the former; they have a black or brown colour: but still their fracture is obscure and not glassy. Their constituent parts are the same with the preceding ones; the usual fluxes attack them with difficulty, and the fusible salt of urine has scarce any power over them.

The vitreous lava has been more completely melted, and forms vitrifications of different colours, generally black or ash-coloured, but rarely blue or greenish. A species of this was analysed by Mr Bergman, as has been already mentioned, and afforded 49 *per cent.* of silica, 35 of argillaceous, 4 of calcareous earth, and 12 of iron. Another specimen from the Lipari islands afforded 69 parts of silica, 20 of argillaceous earth, and 9 of iron. This kind of lava melts by itself with great difficulty. The black agate of Iceland belongs to this species, as does also the harder sort of pitch stone, which gives fire with steel. This stone is of various colours, grey, green, black, red, or brown; has a glassy appearance, being composed of femivitrified substances, and melts easily *per se.* It contains 65 *per cent.* of silica, 16 of argillaceous earth, and four of iron; 14 parts were dissipated in the analysis made by Wiegleb, as Mr Kirwan asserts.

The beds of lava are deepest and narrowest near the crater, and broader and shallower as they advance, unless some valley intervenes. Pumice-stones lie at a still greater distance: and from these observations, says Mr Kirwan, extinguished volcanoes may be traced.

Cronstedt conjectured that there might be a kind of circulation among the different earths, from the vegetable mould, which he supposed to occupy one extreme, to the *slags* or volcanic productions, which might be reckoned to occupy another, and back again from the slags to the vegetable mould. "It is obvious (says he) how the old heaps of slags from the iron furnaces decay, and at last produce vegetables, which cannot be ascribed solely to a black mould carried thither by the wind. The same may perhaps happen with the natural slags in the open air." Other naturalists have verified this conjecture. All lavas are found to be decomposable by long exposure to the air, sooner or later according to the quantity of iron and calcareous earth they contain, and according as their fusion was more or less complete. Sir William Hamil-

ton has concluded that they gain only one or two feet mould in 1000 years; from which, and Roupero's calculations, extravagant ideas have been formed of the duration of the world; but all these are found, when properly examined, to be built on a false foundation. See the article EARTH, n<sup>o</sup> 176, 177.

The quantity of matter thrown out from volcanoes under the name of *lava* is prodigious. After the great eruption of Etna in 1669, Borrelli went from Pisa to Sicily to observe the effects of it. The matter thrown out at that time amounted to 93,830,750 cubical paces; so that, had it been extended in length upon the surface of the earth, it would have reached more than four times round the whole earth. All this matter, however, was not lava, but consisted also of sand, stone, gravel, &c. The lava he computed at 6,300,000 paces, which formed a river, according to our author, sometimes two miles broad; but according to others it was six or seven miles broad, and sometimes 20 or 30 yards in depth. Sir William Hamilton informs us, that the lavas of Etna are very commonly 15 or 20 miles in length, six or seven in breadth, and 50 feet deep. The most considerable is scarce less than 30 miles long and 15 broad. The most considerable lavas of Vesuvius do not exceed seven miles in length. The same author, however, tells us, that the lava which issued from Vesuvius in 1767, was six miles long, two in breadth, and in most places 60 or 70 feet deep. In one place it had run along a hollow-way made by currents of rain not less than 200 feet deep and 100 wide; and this vast hollow it had in one place filled up. He says, he could not have believed that so great a quantity of matter could have been thrown out in such a short time, if he had not examined the whole course of it himself. Even this quantity, however, great as it is, appears very trifling in comparison of that thrown out in Iceland in the year 1783, which covered a space of ground 90 miles in length and 42 in breadth, to the depth of more than 100 feet. Dr Van Troil, in his Letters on Iceland, tells us, that he and his companions travelled over a tract of lava upwards of 300 miles in length: and in 1728, we are told that an eruption of lava took place, which continued for two years to run into a great lake, which it almost filled up.

As the lavas are thrown out from the volcanoes in the highest degree of ignition, it may easily be supposed that such vast bodies will retain their heat for a long time. It would indeed be well worth observing, what length of time is required to cool a lava perfectly; as from thence we might in some measure judge how far those philosophers are in the right, who argue concerning the length of time required to cool an ignited globe of the size of our earth or larger. Sir William Hamilton tells us, that in the month of April 1771, he thrust sticks into some of the crevices of the lava which had issued from Vesuvius in October 1767; and they immediately took fire. On Mount Etna, in 1769, he observed the lava that had been disgorged three years before to smoke in many parts. No particular observation, however, hath been made in what proportion the heat of lavas is gradually lost.

Lava.

12  
Vast quantities of lava thrown out.

Require a long time to cool.

Lava,  
Lavanula.14  
Cold and  
noxious va-  
pours pro-  
duced by  
old lavas.

Sir William Hamilton informs us of a curious fact relating to a lava in the island called *Lacco*. Here is a cavern shut up with a door; and this cavern is made use of to cool liquors and fruit, which it does in a short time as effectually as ice. Before the door was opened, he felt the cold on his legs very sensibly; but when it was opened, the cold rushed out so as to give him pain; and within the grotto it was intolerable. He was not sensible of wind attending this cold; tho' upon Mount Etna and Vesuvius, where there are caverns of this kind, the cold is evidently occasioned by a subterraneous wind: the natives call such places *ventaroli*. From old lavas there also frequently happens an eruption of noxious vapours called *mafetes*. These likewise break out from wells and subterraneous places in the neighbourhood of a volcano before an eruption. Our author tells us, that the vapour affects the nostrils, throat, and stomach, just as the spirit of hartshorn or any strong volatile salt; and would soon prove fatal if you did not immediately withdraw from it. These *mafetes*, he says, are at all times to be met with under the ancient lavas of Vesuvius, particularly the great eruption of 1631.

15  
Uses of la-  
va.

Sir William Hamilton informs us, that the lavas of Etna and Vesuvius are much the same, but those of Etna rather blacker and more porous than those of Vesuvius. Some kinds of lava take a fine polish, and are frequently manufactured into boxes, tables, &c. In Naples, the inhabitants commonly make use of it for paving the streets, and even the subterraneous cities of Pompeii and Herculaneum have been paved with the same substance. A fine large cubic piece of lava is preserved in the hall of the British Museum.

**LAVANDULA, LAVENDER:** A genus of the angiospermia order, belonging to the dialymnia class of plants; and in the natural method ranking under the 42d order, *Verticillata*. The calyx is ovate, and a little dentated, supported by a bractea or floral leaf; the corolla is reflexed; and the stamina within the tube.

*Species.* 1. The spica, or lavender spike, hath a short shrubby stalk, rising two or three feet high; small spear-shaped entire leaves; and from the ends of the branches, numerous, long, erect, naked spikes of small ringent flowers, of different colours in the varieties. The varieties of this are common narrow-leaved lavender, with blue flowers, and with white flowers; broad-leaved lavender; dwarf lavender: all of them flowering in July. This species is the common lavender; but the narrow-leaved variety, with blue flowers, is the best commonly cultivated for its flowers for medicine, &c. The *stœchas*, or French lavender, hath a shrubby very branchy stalk, rising two or three feet high; very narrow, spear-shaped, pointed, hoary leaves, opposite; and all the branches terminated by short bushy spikes of purple flowers in June and July; succeeded by seeds in August. There is a variety with white flowers. 3. The *dentata*, or dentate-leaved *stœchas*, hath a woody stalk, branching on every side three or four feet high; leaves deeply indented in a pinnated manner; and the branches terminated by scaly four-cornered spikes of flowers, appearing most part of summer.

*Culture.* All the sorts are propagated plentifully by slips or cuttings of their young shoots in spring. In March or April, take off a quantity of slips or cut-

tings, from three or four to six inches long; strip off the under leaves; then plant them in a shady border, four inches asunder; give a good watering, repeat it occasionally in dry weather, and the plants will be well rooted in summer, and each become a good plant fit to be transplanted into any place early in autumn, that is September or October; removing them, if possible, with balls of earth; and if intended to plant them for use, set them in rows two or three feet asunder, and two feet distance in each row: if any are designed for the shrubbery, they should be stationed singly at good distances near the front. Those of the third sort being tender, should be potted to move to shelter in winter. The *lavandula stœchas* is also often raised from seed, sown in March or April, in a bed of light earth.

*Uses.* The two first species are proper both for the kitchen-garden, for medicinal and other families; and to plant in the pleasure-ground to adorn the front of small shrubbery compartments, where they will increase the variety very agreeably; and are finely-scented aromatics, both when growing, and their flowers when gathered, especially those of the first species, which are in great esteem for putting among cloaths, and for distilling and other economical uses. The flowers of the first sort are gathered for use in July, which being the time of their perfection, cut off the spikes close in a dry day, and tie them in small bunches for use. These and the summits are in a very eminent degree cephalic and nervine. They are given in palsies, vertigos, lethargies, tremors, and suppression of the menstrual evacuation. The compound spirit distilled from them is famous in these and many other like cases. The distilled oil is particularly celebrated for destroying the *pediculi inguinales*, and other cutaneous insects. If soft spongy paper, dipt in this oil, either alone or mixed with oil of almonds, be applied at night to the parts infected, the insects will certainly, says Geoffroy, be all found dead in the morning.

**LAVATERA**, in botany: A genus of the polyandria order, belonging to the polyadelphia class of plants; and in the natural method ranking under the 37th order, *Columifera*. The exterior calyx is double and trisid; the arilli or seed coats are very many and monospermous. There are several species, most of them herbaceous showery annuals, or shrubby perennials, growing erect from two or three to eight or ten feet high, garnished with large roundish, heart-shaped, and angular leaves, and quinquepetalous flowers of the mallow kind. They are easily propagated by seed in the open ground in the spring; and thrive best when sown where they are designed to remain. The *lavatera* tribe affect a warm sandy situation and soil, in which they will sometimes continue to exhibit their beauties for many years; but in general they are short-lived, continuing only two or three years: this renders them peculiarly eligible to be scattered plentifully in a newly made shrubbery; they will add warmth to young plants, and will die away themselves before the spaces they occupy will be required by the surrounding shrubs.

**LAVATORY**, or **LAVADERO**, a name given to certain places in Chili and Peru, where gold is got out of earth by washing.

M. Frezier gives us the following description of the *lavatories*

Lavate  
Lavate

ch, *lavatories* of Chili:—They dig deep into the earth, in such places as they have reason to expect gold in; and, in order to facilitate this digging, turn a stream of water upon the spot, loosening the earth as much as possible all the time, that the current may have the greater effect, and tear up the earth more strongly. When they are got to the earth they want, they turn off the stream, and dig dry.

The earth that they now get, is carried on mules, and discharged into a basin, made somewhat in the manner of a smith's bellows; into which a little rivulet of water runs with a great deal of rapidity, dissolving the parts of the earth, and carrying every thing away with it, excepting the particles of gold, which, by their great weight, precipitate to the bottom of the basin, and mix with fine black sand, where they are almost as much hidden as they were before in the earth.

Sometimes they find very considerable pieces in *lavatories*, particularly pieces of 24 ounces each.—There are several *lavatories*, where they find pepitas, or pieces of virgin gold, of a prodigious size. Among others, they tell of one that weighed 512 ounces, bought by the count de la Moncloa, viceroy of Peru.

Nine or ten leagues to the east of Coquimbo, are the *lavatories* of *Audacoll*, the gold whereof is 23 carats fine.—Their works here always turn to great profit, excepting when the water fails them.—The natives maintain that the earth is creative, that is, it produces gold continually; because, after having been washed 60 or 80 years, they find it impregnated afresh, and draw almost as much out of it as at first.

LUBACH, a handsome and strong town of Germany, in the circle of Aultria, and in Carniola, with a bishop's see, a castle, and very handsome houses. It is seated on a river of the same name, wherein are the largest craw-fish in Europe. E. Long. 14. 45. N. Lat. 46. 20.

LAUD (William), archbishop of Canterbury in the 17th century, was born at Reading in 1573, and educated in St John's college, Oxford, of which he was afterwards a fellow and grammar-reader. In 1610, he went into orders. In 1611, he was elected president of St John's college; but his election being disputed, it was confirmed by his majesty. The same year he was sworn the king's chaplain. In 1621, he was nominated bishop of St David's. In 1628, he was translated to the bishopric of London. In 1630, he was elected chancellor of the university of Oxford. In 1633, he attended the king into Scotland, and was sworn a privy-counsellor for that kingdom. During his stay in Scotland, he formed the resolution of bringing that church to an exact conformity with the church of England. In the same year, he succeeded archbishop Abbot in the see of Canterbury; and soon after came out his majesty's declaration about lawful sports on Sundays, which the archbishop was charged with having revived and enlarged, and that with the vexatious prosecutions of such clergymen as refused to read it in their churches. In 1634-5, the archbishop was put into the great committee of trade and the king's revenue; on the 4th of March following, he was appointed one of the commissioners of the trea-

sure; and on the 6th of March 1635-6, he received the staff of lord high-treasurer of England. In order to prevent the printing and publishing what he thought improper books, he procured a decree to be passed in the star-chamber, on the 11th of July 1637, whereby it was enjoined that the master-printers should be reduced to a certain number, and that none of them should print any books till they were licensed either by the archbishop or the bishop of London, or some of their chaplains, or by the chancellors or vice chancellors of the two universities. A new parliament being summoned, met on the 13th of April 1640; and the convocation the day following: but the commons launching out into complaints against the archbishop, and insisting upon a redress of grievances before they granted any supply, the parliament was dissolved on the 7th of May. The convocation, however, continued sitting; and made 17 canons, which were supposed to be formed under the immediate direction of the archbishop. In the beginning of the long parliament he was attacked on account of those canons: and they being condemned by the house of commons on the 16th of December 1640, "as containing many things contrary to the king's prerogative, to the fundamental laws and statutes of this realm, to the rights of parliament, to the property and liberty of the subject, and tending to sedition, and of dangerous consequence;" he was, on the 18th of December, accused by the commons of high treason, and sent to the Tower. Being tried before the house of lords, for endeavouring to subvert the laws, and to overthrow the Protestant religion, he was found guilty, and beheaded on Tower-hill on January 10th following, in the 72d year of his age. This learned prelate, notwithstanding his being charged with a design to bring in Popery, wrote an answer to Dr Fisher, which is esteemed one of the best pieces that has been printed against that religion. He was temperate in his diet, and regular in his private life: but his fondness for introducing new ceremonies, in which he showed a hot and indiscreet zeal, his encouraging of sports on Sundays, his illegal and cruel severity in the star-chamber and high-commission courts, and the fury with which he persecuted the dissenters, and all who presumed to contradict his sentiments, exposed him to popular hatred. Besides his Answer to Fisher, he published several Sermons, and other works.

LAUDANUM. See OPIUM.

LAUDATIO, in a legal sense, was anciently the testimony delivered in court of the accused person's good behaviour and integrity of life. It resembled the custom, which prevails in our trials, of calling persons to speak to the character of the prisoner. The least number of the *laudatores* amongst the Romans was ten.

LAUDER (William), a native of Scotland, was educated at the university of Edinburgh, where he finished his studies with great reputation, and acquired a considerable knowledge of the Latin tongue. In May 22. 1734, he received a testimonial from the heads of the university, certifying that he was a fit person to teach humanity in any school or college whatever. In 1739 he published at Edinburgh an edition of Johnston's Psalms. In 1742, he was recommended by Mr Patrick Cuming and Mr Colin Mac-

laudin,

Laudarum

Lauder.

Lauder  
||  
Laudohn.

laudin, professors of church-history and mathematics, to the mastership of the grammar-school at Dundee, then vacant. Whether he succeeded in his application or not, is uncertain: but a few years afterwards we find him in London, contriving to ruin the reputation of Milton; an attempt which ended in the destruction of his own. His reason for the attack probably sprung from the virulence of a violent party spirit, which triumphed over every principle of honour and honesty. He began first to retail part of his design in *The Gentleman's Magazine*, 1747; and finding that his forgeries were not detected, was encouraged in 1751 to collect them, with additions, into a volume, intitled, "An Essay on Milton's Use and Imitation of the Moderns in his *Paradise Lost*," 8vo. The fidelity of his quotations had been doubted by several people; and the falsehood of them was soon after demonstrated by Dr Douglas, in a pamphlet intitled, "Milton vindicated from the Charge of Plagiarism brought against him by Lauder, and Lauder himself convicted of several Forgeries and gross Impositions on the Public: In a Letter humbly addressed to the Right Honourable the Earl of Bath, 1751," 8vo. The appearance of this Detection overwhelmed Lauder with confusion. He subscribed a confession, dictated by a learned friend, wherein he ingenuously acknowledged his offence, which he professed to have been occasioned by the injury he had received from the disappointment of his expectations of profit from the publication of Johnston's *Psalms*. This misfortune he ascribed to a couplet in Mr Pope's *Dunciad*, book iv. ver. 3. and from thence originated his rancour against Milton. He afterwards imputed his conduct to other motives; abused the few friends who continued to countenance him; and, finding that his character was not to be retrieved, quitted the kingdom, and went to Barbadoes, where he some time taught a school. His behaviour there was mean and despicable; and he passed the remainder of his life in universal contempt. "He died (says Mr Nichols) some time about the year 1771, as my friend Mr Reed was informed by the gentleman who read the funeral service over him."

LAUDICENI, amongst the Romans, applauders, who for reward entered the rehearsal-rooms, attended the repetition of plays, and were in waiting when orations were pronounced, in order to raise or increase the acclamation and applause.

LAUDOHN (Field-marshal), a celebrated general in the imperial service, born in 1716, was a native of Livonia, and descended from a Scottish family. He made his first campaigns under Marshal Munich, in the war of 1738, between the Russians and Turks; and was at the taking of Oczakow, Choczim, and Stawutzchane, where the Turks were entirely defeated. Frederick the Great refused, in 1741, to take young Laudohn into his service, saying he did not like his countenance; though this monarch, who was considered as the greatest general of his age, afterwards said, that he often admired the positions of other generals, but that he had ever dreaded the battles of Laudohn. In 1756, when but just entered into the service of the house of Austria, with the rank of lieutenant-colonel, he made such a rapid progress, that within less than a year he was a general of artillery, and within three years commander in chief of the whole army. He

N<sup>o</sup> 175.

rescued Olmutz, when besieged by the Prussians; beat the king himself at Frankfort on the Oder; at Zorn-dorf, took General Fouquet prisoner; carried Glatz and Schweidnitz by assault; and stopped the progress of Frederick in a war which might have proved fatal to the house of Austria. In 1778, when elevated to the rank of marshal, at the head of 60,000 men he hindered Henry, brother to the king of Prussia, from joining his army to that of the king. At Dubicza, Novi, Gradisca, and Belgrade, in the late war between the Emperor and the Turks, he had but to present himself before the place, and say with Cæsar, *Veni, vidi, vici*. But at his head-quarters in Moravia, he was seized with a fever, in consequence of an operation he underwent for an obstruction in the urethra. His impatience under the medical applications, the impetuous ardour of his character, and the knowledge, above all, of his importance in the war, contributed to irritate his mind, and promote the violence of the fever. He resisted the application of cataplasms, before and after the incisions were made, with a fatal obstinacy which raised the inflammation to such a height, that he expired under the accession of the fever on the 14th of July 1790, in the 74th year of his age.

LAUDS, LAUDES, the second part of the ordinary office of the breviary, said after matins; though, heretofore, it ended the office of the night.

The laudes consist principally of psalms, hymns, &c. whence they took their name, from *laus, laudis*, "praise."

LAVENHAM, or LANHAM, 61 miles from London, is a pleasant and pretty large town of Suffolk, on a branch of the river Bret, from whence it rises gradually to the top of a hill, where are its church, which is a very handsome Gothic structure, and in which are several ancient monuments; and a spacious marketplace, encompassed with nine streets or divisions, in a very healthy free air. It had formerly a very considerable trade in blue cloth; and had three guilds or companies, with each their hall. It has still a considerable manufactory of ferges, shalloons, says, stuffs, and spinning fine yarn for London; and many hundred loads of wool are delivered in a year from its wool-hall. It is governed by 6 capital burgessees, who are for life, and choose the inferior officers. The church and its steeple, which is 137 feet high, are reckoned the finest in the county. Its tenor bell, though not much more than a ton, has as deep a note as a bell of twice that weight. Here is a free-school and a bride-well, part of which is a workhouse where the poor children, &c. of the parish are employed in spinning hemp, flax, and yarn; besides which, here are other considerable charities. The tenants of the manor and the other inhabitants were always exempted from serving at any court held for its hamlet. They have that tenure of land here which is called *Borough English*. Its markets are on Tuesday, and on Thursday for wool. Its fairs are on Shrove-Tuesday, and October 10.

LAVENDER. See LAVANDULA.

LAVER, in scripture history, a sacred utensil placed in the court of the Jewish tabernacle, consisting of a basin, whence they drew water by cocks, for washing the hands and feet of the officiating priests, and also the entrails and legs of the victims.

LAVERNA,

**LAVERNA**, in antiquity, the goddess of thieves and cheats among the Romans, who honoured her with public worship, because she was supposed to favour those who wished that their designs might not be discovered. Varro says, that she had an altar near one of the gates of Rome; hence called *porta lavernalis*.

**LAUGERIA**, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking among those of which the order is doubtful. The corolla is quinquefid; the fruit is a plum with a quinquelocular kernel.

**LAUGHTER**, an affection peculiar to mankind, occasioned by something that tickles the fancy.

In laughter, the eye-brows are raised about the middle, and drawn down next the nose; the eyes are almost shut; the mouth opens and shows the teeth, the corners of the mouth being drawn back and raised up; the cheeks seem puffed up, and almost hide the eyes; the face is usually red, the nostrils are open; and the eyes wet.

Authors attribute laughter to the fifth pair of nerves, which sending branches to the eye, ear, lips, tongue, palate, and muscles of the cheek, parts of the mouth, præcordia, &c. there hence arises a sympathy, or consent, between all these parts; so that when one of them is acted upon, the others are proportionably affected. Hence a savoury thing seen, or smelt, affects the glands, and parts of the mouth; a thing seen, or heard, that is shameful, affects the cheeks with blushes; on the contrary, if it please and tickle the fancy, it affects the præcordia, and muscles of the mouth and face with laughter; if it cause sadness and melancholy, it likewise affects the præcordia, and demonstrates itself by causing the glands of the eyes to emit tears. Dr Willis accounts for the pleasure of kissing from the same cause; the branches of this fifth pair being spread to the lips, the præcordia, and the genital parts; whence arises a sympathy between those parts.

The affection of the mind by which laughter is produced is seemingly so very different from the other passions with which we are endowed, that it hath engaged the attention of very eminent persons to find it out.—1. Aristotle, in the fifth chapter of his Poetics, observes of comedy, that “it imitates those vices or meannesses only which partake of the ridiculous:—now the ridiculous (says he) consists of some fault or turpitude not attended with great pain, and not destructive.” 2. “The passion of laughter (says Mr Hobbes) is nothing else but sudden glory arising from some sudden conception of some eminency in ourselves, by comparison with the infirmity of others, or with our own formerly. For men (continues he) laugh at the follies of themselves past, when they come suddenly to remembrance, except when we bring with them any sudden dishonour.” 3. Akenfide, in the third book of his excellent poem, treats of ridicule at considerable length. He gives a detail of ridiculous characters; ignorant pretenders to learning, boastful soldiers, and lying travellers, hypocritical churchmen, conceited politicians, old women that talk of their charms and virtue, ragged philosophers who rail at riches, virtuosi intent upon trifles, romantic lovers, wits wantonly satirical, fops that out of vanity appear to be diseased and profligate, dastards who are ashamed or afraid without reason, and fools who are

ignorant of what they ought to know. Having finished the detail of characters he makes some general remarks on the cause of ridicule; and explains himself more fully in a prose definition illustrated by examples. The definition, or rather description, is in these words.

“That which makes objects ridiculous, is some ground of admiration or esteem connected with other more general circumstances comparatively worthless or deformed: or it is some circumstance of turpitude or deformity connected with what is in general excellent or beautiful; the inconsistent properties existing either in the objects themselves, or in the apprehension of the person to whom they relate; belonging always to the same order or class of being; implying sentiment and design, and exciting no acute or vehement commotion of the heart.”—4. Hutcheson has given another account of the ludicrous quality, and seems to think that it is the contrast or opposition of dignity and meanness which occasions laughter.

All these opinions are refuted by Dr Beattie in his Essay on Laughter and Ludicrous Composition, where he has treated the subject in a masterly manner. “To provoke laughter (says he), is not essential either to wit or humour. For though that unexpected discovery of resemblance between ideas supposed dissimilar, which is called *wit*—and that comic exhibition of singular characters, sentiments, and imagery, which is denominated *humour*,—do frequently raise laughter, they do not raise it always. Addison’s poem to Sir Godfrey Kneller, in which the British kings are likened to heathen gods, is exquisitely witty, and yet not laughable. Pope’s Essay on Man abounds in serious wit; and examples of serious humour are not uncommon in Fielding’s History of Parson Adams, and in Addison’s account of Sir Roger de Coverley. Wit, when the subject is grave, and the allusions sublime, raises admiration instead of laughter: and if the comic singularities of a good man appear in circumstances of real distress, the imitation of these singularities in the epic or dramatic comedy will form a species of humour, which, if it should force a smile, will draw forth a tear at the same time. An inquiry, therefore, into the distinguishing characters of wit and humour has no necessary connection with the present subject.

“Some authors have treated of ridicule, without marking the distinction between *ridiculous* and *ludicrous* ideas. But I presume the natural order of proceeding in this inquiry, is to begin with ascertaining the nature of what is *purely ludicrous*. Things *ludicrous* and things *ridiculous* have this in common, that both excite laughter; but the former excite pure laughter, the latter excite laughter mixed with disapprobation and contempt. My design is to analyse and explain that quality in things or ideas, which makes them provoke *pure laughter*, and intitles them to the name of *ludicrous* or *laughable*.

“When certain objects, qualities, or ideas, occur to our senses, memory, or imagination, we smile or laugh at them, and expect that other men should do the same. To smile on certain occasions is not less natural, than to weep at the sight of distress, or cry out when we feel pain.

“There are different kinds of laughter. As a boy, passing by night through a church-yard, sings or whistles in order to conceal his fear even from himself;

Laughter. so there are men, who, by forcing a smile, endeavour sometimes to hide from others, and from themselves too perhaps, their malevolence or envy. Such laughter is unnatural. The sound of it offends the ear; the features distorted by it seem horrible to the eye. A mixture of hypocrisy, malice, and cruel joy, thus displayed on the countenance, is one of the most hateful sights in nature, and transforms the "human face divine" into the visage of a fiend. Similar to this is the smile of a wicked person pleasing himself with the hope of accomplishing his evil purposes. Milton gives a striking picture of it in that well-known passage :

He ceas'd; for both seem'd highly pleas'd; and Death  
Grin'd horrible a ghastly smile, to hear  
His famine should be fill'd, and blest his maw  
Destin'd to that good hour —

But enough of this. Laughter that makes man a fiend or a monster, I have no inclination to analyse. My inquiries are confined to that species of laughter which is at once natural and innocent.

"Of this there are two sorts. The laughter occasioned by tickling or gladness is different from that which arises on reading the Tale of a Tub. The former may be called *animal-laughter*: the latter (if it were lawful to adopt a new word which has become very common of late) I should term *sentimental*. Smiles admit of similar divisions. Not to mention the scornful, the envious, the malevolent smile, I would only remark, that of the innocent and agreeable smile there are two sorts. The one proceeds from the risible emotion, and has a tendency to break out into laughter. The other is the effect of good-humour, complacency, and tender affection. This last sort of smile renders a countenance amiable in the highest degree. Homer ascribes it to Venus in an epithet (*εὐρομευιδης*), which Dryden and Pope, after Waller, improperly translate *laughter-loving*; an idea that accords better with the character of a romp or hoyden, than with the goddess of love and beauty.

"Animal-laughter admits of various degrees; from the gentle impulse excited in a child by moderate joy, to that terrifying and even mortal convulsion which has been known to accompany a change of fortune. This passion may, as well as joy and sorrow, be communicated by sympathy; and I know not whether the entertainment we receive from the playful tricks of kittens and other young animals may not in part be resolved into something like a fellow feeling of their vivacity.—Animal and sentimental laughter are frequently blended; but it is easy to distinguish them. The former is often excessive; the latter never, unless heightened by the other. The latter is always pleasing, both in itself and in its cause; the former may be painful in both. But their principal difference is this:—The one always proceeds from a sentiment or emotion excited in the mind, in consequence of certain ideas or objects being presented to it, of which emotion we may be conscious even when we suppress laughter;—the other arises not from any sentiment or perception of ludicrous ideas, but from some bodily feeling, or sudden impulse on what is called the *animal spirits*, proceeding, or seeming to proceed, from the operation of causes purely material. The present inquiry regards that species that is here distinguished by the name of *sentimental laughter*.

"The pleasing emotion, arising from the view of

ludicrous ideas, is known to every one by experience; but, being a simple feeling, admits not of definition. It is to be distinguished from the laughter that generally attends it, as sorrow is to be distinguished from tears; for it is often felt in a high degree by those who are remarkable for gravity of countenance. Swift seldom laughed, notwithstanding his uncommon talents in wit and humour, and the extraordinary delight he seems to have had in surveying the ridiculous side of things. Why this agreeable emotion should be accompanied with laughter as its outward sign, or sorrow express itself by tears, or fear by trembling or paleness, I cannot ultimately explain, otherwise than by saying, that such is the appointment of the Author of nature.—All I mean by this inquiry is, to determine, "What is peculiar to those things which produce laughter;—or rather, which raise in the mind that pleasing sentiment or emotion whereof laughter is the external sign."

"Philosophers have differed in their opinions concerning this matter. In Aristotle's definition quoted above, it is clear that he means to characterize, not laughable qualities in general (as some have thought), but the objects of comic ridicule only; and in this view the definition is just, however it may have been overlooked or despised by comic writers. Crimes and misfortunes are often in modern plays, and were sometimes in the ancient, held up as objects of public merriment; but if poets had that reverence for nature which they ought to have, they would not shock the common sense of mankind by so absurd a representation.—The definition from Aristotle does not, however, suit the general nature of ludicrous ideas; for it will appear by and by, that men laugh at that in which there is neither fault or turpitude of any kind.

"The theory of Mr Hobbes would hardly have deserved notice, if Addison had not spoken of it with approbation in the 47th paper of the Spectator. He justly observes, after quoting the words of Mr Hobbes formerly mentioned, that, "according to this account, when we hear a man laugh excessively, instead of saying that he is very merry, we ought to tell him that he is very proud." It is strange, that the elegant author should be aware of this consequence, and yet admit the theory: for so good a judge of human nature could not be ignorant, that laughter is not considered as a sign of pride; persons of singular gravity being often suspected of that vice, but great laughers seldom or never. When we see a man attentive to the innocent humours of a merry company, and yet maintain a fixed solemnity of countenance, is it natural for us to think that he is the humblest, and the only humble person in the circle?

"Another writer in the Spectator, n<sup>o</sup> 249, remarks, in confirmation of this theory, that the *vainest* part of mankind are most addicted to the passion of laughter. Now, how can this be, if the *proudest* part of mankind are also most addicted to it, unless we suppose vanity and pride to be the same thing? But they certainly are different passions. The proud man despises other men, and derives his chief pleasure from the contemplation of his own importance: the vain man stands in need of the applause of others, and cannot be happy without it. Pride is apt to be reserved and fullen; vanity is often affable, and officiously obliging. The proud

laughter. proud man is so confident of his merit, and thinks it so obvious to all the world, that he will scarce give himself the trouble to inform you of it: the vain man, to raise your admiration, scruples not to tell you, not only the whole truth, but even a great deal more. In the same person these two passions may, no doubt, be united; but some men are too proud to be vain, and some vain men are too conscious of their own weakness to be proud. Be all this, however, as it will, we have not as yet made any discovery of the cause of laughter: in regard to which, I apprehend, that the vain are not more intemperate than other people; and I am sure that the proud are much less so.

“Hutcheson’s account of the origin of laughter is equally unsatisfactory. Granting what he says to be true, I would observe, in the first place, what the ingenious author seems to have been aware of, that there may be a mixture of meanness and dignity where there is nothing ludicrous. A city, considered as a collection of low and lofty houses, is no laughable object. Nor was that person either ludicrous or ridiculous, whom Pope so justly characterises,

“The greatest, wisest, meanest, of mankind.”

—But, secondly, cases might be mentioned, of laughter arising from a group of ideas or objects, where in there is no discernible opposition of meanness or dignity. We are told of the dagger of Hudibras, that

“It could scrape trenchers, or chip bread,  
 “Toast cheese or bacon, though it were  
 “To bait a mouse-trap, ’twou’d not care;  
 “’Twou’d make clean shoes, or in the earth  
 “Set leeks and onions, and so forth.”

The humour of the passage cannot arise from the meanness of these offices compared with the dignity of the dagger, nor from any opposition of meanness and dignity in the offices themselves, they being all equally mean; and must therefore be owing to some peculiarity in the description. We laugh, when a droll mimics the solemnity of a grave person; here dignity and meanness are indeed united: but we laugh also (tho’ not so heartily perhaps) when he mimics the peculiarities of a fellow as insignificant as himself, and displays no opposition of dignity and meanness. The levities of Sancho Panca opposed to the solemnity of his master, and compared with his own schemes of preferment, form an entertaining contrast: but some of the vagaries of that renowned squire are truly laughable even when his preferment and his maul are out of the question. Men laugh at puns; the wisest and wittiest of our species have laughed at them; queen Elisabeth, Cicero, and Shakespear, laughed at them; clowns and children laugh at them; and most men, at one time or other, are inclined to do the same: but in this sort of low wit, is it an opposition of meanness and dignity that entertains us? Is it not rather a mixture of sameness and diversity, — sameness in the sound, and diversity in the signification?

“In the characters mentioned by Akenfide, the author does not distinguish between what is *laughable* and what is *contemptible*; so that we have no reason to think, that he meant to specify the qualities peculiar to those things which provoke *pure laughter*; and whatever account we may make of his definition, which to those who acquiesce in the foregoing reasonings

laughter. may perhaps appear not quite satisfactory, there is in the poem a passage that deserves particular notice, as it seems to contain a more exact account of the ludicrous quality than is to be found in any of the theories abovementioned. This passage we shall soon have occasion to quote.”

Our author now goes on to lay down his own theory concerning the origin of laughter, which he supposes to arise from the view of things incongruous united in the same assemblage. “However imperfect (says he) the abovementioned theories may appear, there is none of them destitute of merit; and indeed the most fanciful philosopher seldom frames a theory without consulting nature in some of her more obvious appearances. Laughter very frequently arises from the view of dignity and meanness united in the same object; sometimes, no doubt, from the appearance of assumed inferiority, as well as of small faults and unimportant turpitudes; and sometimes, perhaps, though rarely, from that sort of pride which is described in the passage already quoted from Hobbes.

“All these accounts agree in this, that the cause of laughter is something compounded; or something that disposes the mind to form a comparison, by passing from one object or idea to another. That this is in fact the case, cannot be proved *a priori*; but this holds in all the examples hitherto given, and will be found to hold in all that are given hereafter. May it not then be laid down as a principle, That laughter arises from the view of two or more objects or ideas disposing the mind to form a comparison? According to the theory of Hobbes, this comparison would be between the ludicrous object and ourselves; according to those writers who misapply Aristotle’s definition, it would seem to be formed between the ludicrous object and things or persons in general; and if we incline to Hutcheson’s theory, which is the best of the three, we shall think that there is a comparison of the parts of the ludicrous object, first with one another, and secondly with ideas or things extraneous.

“Further: every appearance that is made up of parts, or that leads the mind of the beholder to form a comparison, is not ludicrous. The body of a man or woman, of a horse, a fish, or a bird, is not ludicrous, though it consists of many parts; and it may be compared to many other things without raising laughter; but the picture described in the beginning of the epistle to the Pisos, with a man’s head, a horse’s neck, feathers of different birds, limbs of different beasts, and the tail of a fish, would have been thought ludicrous 1800 years ago, if we believe Horace, and in certain circumstances would no doubt be so at this day. It would seem then, that ‘the parts of a laughable assemblage must be in some degree unsuitable and heterogeneous.’

“Moreover: any one of the parts of the Horatian monster, a human head, a horse’s neck, the tail of a fish, or the plumage of a fowl, is not ludicrous in itself; nor would those several pieces be ludicrous, if attended to in succession, without any view to their union. For to see them disposed on the different shelves of a museum, or even on the same shelf, nobody would laugh, except, perhaps, the thought of uniting them were to occur to his fancy, or the passage of Horace to his memory. It seems to follow, that ‘the incongruous parts of a laughable idea or object must either

Laughter. be combined so as to form an assemblage, or must be supposed to be so combined."

"May we not then conclude, 'that laughter arises from the view of two or more inconsistent, unsuitable, or incongruous parts or circumstances, considered as united in one complex object or assemblage, or as acquiring a sort of mutual relation from the peculiar manner in which the mind takes notice of them?' The lines from Akenfide formerly referred to, seem to point at the same doctrine:

Where'er the pow'r of ridicule displays  
Her quaint-eye'd visage, *some incongruous form,*  
*Some stubborn dissonance of things combin'd,*  
Strikes on the quick observer.

And to the same purpose, the learned and ingenious Dr Gerard, in his *Essay on Taste*: 'The sense of ridicule is gratified by an inconsistency and dissonance of circumstances in the same object, or in objects nearly related in the main; or by a similitude or a relation unexpected between things on the whole opposite and unlike.'

"And therefore, instead of saying, with Hutcheson, that the cause or object of laughter is an 'opposition of dignity and meanness;' I would say, in more general terms, that it is 'an opposition of suitability or unsuitableness, or of relation and the want of relation, united, or supposed to be united, in the same assemblage.' Thus the offices ascribed to the dagger of Hudibras seem quite heterogeneous; but we discover a bond of connection among them, when we are told that the same weapon could occasionally perform them all. Thus, even in that mimicry which displays no opposition of dignity and meanness, we perceive the actions of one man joined to the features and body of another; that is, a mixture of unsuitableness, or want of relation, arising from the difference of persons, with congruity and similitude, arising from the sameness of the actions. And here let it be observed in general, that the greater number of incongruities that are blended in the same assemblage, the more ludicrous it will probably be. If, as in Butler's resemblance of the morning to a boiled lobster, there is a mixture of dignity and meanness, as well as of likeness and dissimilitude, the effect of the contrast will be more powerful, than if only one of these oppositions had occurred in the ludicrous idea. The sublimity of Don Quixote's mind, contrasted and connected with his miserable equipage, forms a very comical exhibition; but when all this is still further connected and contrasted with Sancho Panca, the ridicule is heightened exceedingly. Had the knight of the lions been better mounted and accoutred, he would not have made us smile so often; because, the hero's mind and circumstances being more adequately matched, the whole group would have united fewer inconsistencies, and reconciled fewer incongruities. Butler has combined a still greater variety of uncouth and jarring circumstances in Ralpho and Hudibras: but the picture, though more elaborate, is less natural. Yet this argues no defect of judgment. His design was, to make his hero not only ludicrous, but contemptible; and therefore he jumbles together, in his equipage and person, a number of mean and disgusting qualities, pedantry, ignorance, naivets, and extreme deformity. But the knight of La Mancha, though a ludicrous, was never

intended for a contemptible, personage. He often moves our pity, he never forfeits our esteem; and his adventures and sentiments are generally interesting; which could not have been the case if his story had not been natural, and himself been endowed with great as well as good qualities. To have given him such a shape, and such weapons, arguments, boots, and breeches, as Butler has bestowed on his champion, would have destroyed that solemnity which is so striking a feature in Don Quixote; and Hudibras, with the manners and person of the Spanish hero, would not have been that paltry figure which the English poet meant to hold up to the laughter and contempt of his countrymen. Sir Launcelot Greaves is of Don Quixote's kindred, but a different character. Smollet's design was not to expose him to ridicule, but rather to recommend him to our pity and admiration. He has therefore given him youth, strength, and beauty, as well as courage and dignity of mind; has mounted him on a generous steed, and arrayed him in an elegant suit of armour. Yet, that the history might have a comic air, he has been careful to contrast and connect Sir Launcelot with a squire and other associates of very dissimilar tempers and circumstances.

"What has been said of the cause of laughter does not amount to an exact description, far less to a logical definition: there being innumerable combinations of congruity and inconsistency, of relation and contrariety, of likeness and dissimilitude, which are not ludicrous at all. If we could ascertain the peculiarities of these, we should be able to characterize with more accuracy the general nature of ludicrous combination. But before we proceed to this, it would be proper to evince, that of the present theory thus much at least is true, that though every incongruous combination is not ludicrous, every ludicrous combination is incongruous.

"It is only by a detail of facts or examples that any theory of this sort can be either established or overthrown. By such a detail, the foregoing theories have been, or may be, shown to be ill-founded, or not sufficiently comprehensive. A single instance of a laughable object, which neither unites, nor is supposed to unite, incongruous ideas, would likewise show the insufficiency of the present; nor will I undertake to prove (for indeed I cannot), that no such instance can be given. A complete enumeration of ludicrous objects it would be in vain to attempt: and therefore we can never hope to ascertain, beyond the possibility of doubt, that common quality which belongs to all ludicrous ideas that are, or have been, or may be, imagined. All that can be done in a case of this kind is to prove by a variety of examples, that the theory now proposed is more comprehensive, and better founded, than any of the foregoing." This our author afterwards shows at full length; but as the variety of examples adduced by him would take up too much room to be inserted here, and as every reader must be capable of adducing numberless instances of ludicrous cases to himself, we shall content ourselves with the above explanation of the different theories of laughter, referring those who desire further satisfaction to the treatise already quoted.

LAVINGTON-EAST, a town of Wilts, 4 miles south of the Devizes, and 89 miles from London. It is called in our histories Stepult-Lavington; but now Cheaping

*Laurus Papyrifera.*

*Lanius-tyrannus.*

*Paplysia.*

*Lepus analifera.*

*Leptura.*

*Abel'schen Mal'sculptor fecit.*

**vinium** Cheaping or Market-Lavington on account of its markets, which are on Monday and Wednesday, the last a great corn-market. It is supposed to have been a market-town above 200 years. Here is a charity-school for 36 children, who have books given them, and the girls are taught to knit and sew.

**LAVINIUM** (anc. geog.), a town of Latium, six miles to the east of Laurentum, according to an ancient map; so named from *Lavinia*, consort of Æneas, and daughter of king Latinus, and built by the Trojans. The first town of Roman original in Latium, and the seat of the Dii Penates, (Livy): situated near the river Numicus, or Numicius; between which and the Tiber Æneas landed, according to Virgil. Holstenius supposes the town to have stood on an eminence, now called *il Monte di Levano*.

**LAUNCE.** See **LANCE.**

**LAUNCESTON**, a town of Cornwall in England, seated on the river Tamar, 214 miles from London. It is also called *Dunhivid*, from its situation on a down. King Henry III. made it a free borough. It was composed before of two other boroughs, *viz.* Dunhivid and Newport. It has been the place for choosing knights of the shire ever since the reign of King Edward I. and the assizes-town ever since Richard II. till by a late act of parliament the lord chancellor or lord keeper was empowered to name any other place in the county for it; since which the summer assizes have been held at Bodmin. It was incorporated by Queen Mary in 1555. It is governed by a mayor, recorder, and eight aldermen, has a free school which was founded by Queen Elizabeth, and is a populous trading town. Its markets are on Thursday and Saturday, and it has four fairs. In the 32d of Henry VIII. an act was made for the repair of this and other decayed Cornish boroughs; and it endowed this town with the privileges of a sanctuary, though it does not appear to have used them. It had a monastery and a noble castle, which, because of its strength, was called *castle-terrible*, and was given by King Richard I. to his brother, afterwards King John. Here are two charity schools for 48 children of both sexes, where the girls are taught to knit, sew, and make bonelace, and are allowed what they can earn. Leland says it was walled in his time, and one mile in compass. Its list of burghesses commences in the 23d of Edward I. The lower part of its ancient castle is made use of for the gaol.

**LAUNCH**, in the sea-language, signifies to put out: as, *Launch the ship*, that is, Put her out of dock; *launch aft*, or *forward*, speaking of things that are stowed in the hold, is, put them more forward; *launch ho!* is a term used when a yard is hoisted high enough, and signifies *hoist no more*. See also **LANCH.**

**LAUNDER**, in mineralogy, a name given in Devonshire, and other places, to a long and shallow trough, which receives the powdered ore after it comes out of the box or coffer, which is a sort of mortar, in which it is powdered with iron pestles. The powdered ore, which is washed into the launder by the water from the coffer, is always finest nearest the grate, and coarser all the way down.

**LAURA**, in church-history, a name given to a collection of little cells at some distance from each other,

in which the hermits in ancient times lived together in a wilderness. Laura etc.

These hermits did not live in community, but each monk provided for himself in his distinct cell. The most celebrated luras mentioned in ecclesiastical history were in Palestine: as the laura of St Euthymus, at four or five leagues distance from Jerusalem; the laura of St Saba, near the brook Cedron; the laura of the Towers, near the river Jordan, &c.

**POET-LAUREATE**, an officer of the household of the kings of Britain, whose business consists only in composing an ode annually on his majesty's birth-day, and on the new year; sometimes also, though rarely, on occasion of any remarkable victory.—Of the first institution of poets laureate, Mr Wharton has given the following account in his history of English poetry. "Great confusion has entered into this subject, on account of the degrees in grammar, which included rhetoric and versification, anciently taken in our universities, particularly at Oxford: on which occasion, a wreath of laurel was presented to the new graduate, who was afterwards usually styled *Poeta Laureatus*. These scholastic laureations, however, seem to have given rise to the appellation in question. I will give some instances at Oxford, which at the same time will explain the nature of the studies for which our academical philologists received their rewards. About the year 1470, one John Watson, a student in grammar, obtained a concession to be graduated and laureated in that science; on condition that he composed one hundred Latin verses in praise of the university, and a Latin comedy. Another grammarian was distinguished with the same badge, after having stipulated, that, at the next public act, he would affix the same number of hexameters on the great gates of St Mary's church, that they might be seen by the whole university. This was at that period the most convenient mode of publication. About the same time, one Maurice Byrchenfaw, a scholar in rhetoric, supplicated to be admitted to read lectures, that is, to take a degree in that faculty; and his petition was granted, with a provision, that he should write one hundred verses on the glory of the university, and not suffer Ovid's Art of Love, and the Elegies of Pamphilus, to be studied in auditory. Not long afterwards, one John Bulman, another rhetorician, having complied with the terms imposed, of explaining the first book of Tully's Offices, and likewise the first of his Epistles, without any pecuniary emolument, was graduated in rhetoric; and a crown of laurel was publicly placed on his head by the hands of the chancellor of the university. About the year 1489, Skelton was laureated at Oxford, and in the year 1493 was permitted to wear his laurel at Cambridge. Robert Whittington affords the last instance of a rhetorical degree at Oxford. He was a secular priest, and eminent for his various treatises in grammar, and for his facility in Latin poetry: having exercised his art many years, and submitting to the customary demand of an hundred verses, he was honoured with the laurel in the year 1512.

"With regard to the poet-laureate of the kings of England, he is undoubtedly the same that is styled the *king's versifier*, and to whom 100 shillings were paid as

his

Laureate  
 ff  
 Laurentalia.

his annual stipend in the year 1251. But when or how that title commenced, and whether this officer was ever solemnly crowned with laurel at his first investiture, I will not pretend to determine, after the searches of the learned Selden on this question have proved unsuccessful. It seems most probable, that the barbarous and inglorious name of *versifier* gradually gave way to an appellation of more elegance and dignity: or rather, that at length those only were in general invited to this appointment, who had received academical sanction, and had merited a crown of laurel in the universities for their abilities in Latin composition, particularly Latin versification. Thus the *king's laureate* was nothing more than 'a graduated rhetorician employed in the service of the king.' That he originally wrote in Latin, appears from the ancient title *versificator*: and may be moreover collected from the two Latin poems, which Bafon and Gulielmus, who appear to have respectively acted in the capacity of royal poets to Richard I. and Edward II. officially composed on Richard's crusade, and Edward's siege of Striveley castle.

"Andrew Bernard, successively poet-laureate of Henry VII. and VIII. affords a still stronger proof that this officer was a Latin scholar. He was a native of Tholoufe, and an Augustine monk. He was not only the king's poet-laureate, as it is supposed, but his historiographer, and preceptor in grammar to Prince Arthur. He obtained many ecclesiastical preferments in England. All the pieces now to be found, which he wrote in the character of poet-laureate, are in Latin. These are, "An *Address* to Henry VIII. for the most auspicious beginning of the 10th year of his reign, with an *Epithalamium* on the marriage of Francis the dauphin of France with the king's daughter;" *A New Year's Gift* for the 1515; and, *Verses* wishing prosperity to his majesty's 13th year. He has left some Latin hymns; and many of his Latin prose pieces, which he wrote in the quality of historiographer to both monarchs, are remaining.

"I am of opinion, that it was not customary for the royal laureate to write in English, till the reformation of religion had begun to diminish the veneration for the Latin language; or, rather, till the love of novelty, and a better sense of things, had banished the narrow pedantries of monastic erudition, and taught us to cultivate our native tongue."

LAUREL. See PRUNUS and LAURUS.

LAURELS, pieces of gold coined in the year 1619, with the king's head laureated, which gave them the name of *laurels*; the 20s. pieces whereof were marked with XX. the 10s. X. and the 5s. pieces with V.

LAURENS CASTRA. See LAURENTUM.

LAURENTALIA, or LAARENTALIA, called also *Laurentinalia*, *Laurentales*, and *Larentales*, feasts celebrated among the Romans on the 10th of the kalends of January, or 23d of December, in memory of Acca Laurentia, wife of the shepherd Faustulus, and nurse of Romulus and Remus.

Acca Laurentia, from whom the solemnity took its name, is represented as no less remarkable for the beauty of her person, than her lasciviousness; on account of which, she was nick-named by her neighbours *lupa*, "she-wolf;" which is said to have given rise to the tradition of Romulus and Remus being suckled by a

wolf. She afterwards married a very rich man, who brought her great wealth, which, at her death, she left to the Roman people; in consideration whereof they performed to her these honours; though others represent the feast as held in honour of Jupiter Latiaris. See LAURENTINALIA and LARES.

LAURENTIUS, one of the first printers, and, according to some, the inventor of the art, was born at Haerlem about the year 1370, and executed several departments of magistracy of that city. Those writers are mistaken who assign to him the surname of *Coster*, or assert that the office of *ædituus* was hereditary in his family. In a diploma of Albert of Bavaria in 1380, in which, among other citizens of Haerlem, our Laurentius's father is mentioned by the name of *Jouannes Laurentii filius*," Beroldus is called *ædituus*, who was surely of another family; and in 1396 and 1398, Henricus à Lunen enjoyed that office; after whose resignation, Count Albert conferring on the citizens the privilege of electing their *ædituus*, they, probably soon after, fixed on Laurentius; who was afterwards called *Coster* from his office, and not from his family name, as he was descended from an illegitimate branch of the Gens Brederodia. His office was very lucrative; and that he was a man of great property, the elegance of his house may testify. That he was the *inventor* of printing, is asserted in the narrative of Junius. His first work was an *Horarium*, containing the Letters of the alphabet, the Lord's prayer, the apostle's creed, and two or three short prayers; the next was the *Speculum salutis*, in which he introduced *pictures* on *wooden blocks*; then *Donatus*, the larger size; and afterwards the same work in a less size. All these were printed on *separate moveable wooden types* fastened together by threads. If it be thought improbable, that so ingenious a man should have proceeded no farther than the invention of *wooden types*; it may be answered, that he printed for profit, not for fame; and *wooden types* were not only at that time made sooner and cheaper than *metal* could be, but were sufficiently durable for the small impressions of each book he must necessarily have printed.—His press was nearly shaped like the common wine-presses.—He printed some copies of *all* his books both on paper and vellum.—It has been very erroneously supposed, that he quitted the profession, and died broken hearted: but it is certain, that he did not live to see the art brought to perfection.—He died in 1440, aged 70; and was succeeded either by his son-in-law Thomas Peter, who married his only daughter Lucia; or by their immediate descendants, Peter, Andrew, and Thomas; who were old enough (even if their father was dead, as it is likely he was) to conduct the business, the eldest being at least 22 or 23. What books they printed it is not easy to determine; they having, after the example of Laurentius (more anxious for profit than for fame), neither added to their books their names, the place where they were printed, or the date of the year. Their first essays were new editions of *Donatus* and the *Speculum*. They afterwards reprinted the latter, with a Latin translation, in which they used their grandfather's wooden pictures; and printed the book partly on *wooden blocks*, partly on *wooden separate types*, according to Mr Meerman, who has given an exact engraving

graving of *each sort*, taken from different parts of the same book, which was published between the years 1442 and 1450. Nor did they stop here: they continued to print several editions of the *Speculum*, both in Latin and in Dutch; and many other works, particularly "Historia Alexandri Magni;" "Flavii Vegetii [for Vegetii] Renati Epitome de Re Militari;" and "Opera varia à Thomas Kempis." Of each of these Mr Meerman has given an engraved specimen. They were all printed with *separate wooden types*; and, by their great neatness, are a proof that the descendants of Laurentius were industrious in improving his invention. Kempis was printed at Haerlem in 1472, and was the last known work of Laurentius's descendants, who soon after disposed of all their materials, and probably quitted the employment; as the use of *single types* was about that time universally diffused through Holland by the settling of Martens at Alott, where he pursued the art with reputation for upwards of 60 years. See (*History of*) PRINTING.

LAURENTIUM, or LAURENS CASTRA, (anc. geog.), a town of Latium, supposed to be the royal residence of those most ancient kings Latinus, Picus, and Faunus, (Virgil). Hither the emperor Commodus retired during a pestilence. Its name was from an adjoining grove of bay-trees, midway between Ostia and Antium. Supposed to have stood in the place now called *San Lorenzo*; which seems to be confirmed from the Via Laurentina leading to Rome.

LAURO (Philippo), a celebrated painter, born at Rome in 1623. He learned the first rudiments of the art from his father Balthasar, who was himself a good painter. He afterward studied under Angelo Carofello, his brother-in-law; and proved so great a proficient, that in a short time he far surpassed his tutor in design, colouring, and elegance of taste. He applied himself to painting historical subjects in a small size, enriching the back-grounds with lively landscapes, that afforded the eye and the judgment equal entertainment; but though his small paintings are best approved, he finished several grand compositions for altar-pieces that were highly esteemed. He died in 1694; and his works are eagerly bought up at high prices all over Europe.

LAURO, or *Lauron* (anc. geog.), a town of the Hither Spain, where Cn. Pompeius, son of Pompey the Great, was defeated and slain. Now Lorigne, five leagues to the north of Liria in Valencia.

LAURUS, the BAY-TREE: A genus of the monogynia order, belonging to the enneandria class of plants; and in the natural method ranking under the 12th order, *Holoraceæ*. There is no calyx; the corolla is calycine, or serving in place of the calyx, and sexpartite; the nectarium with three glandules, each terminated by two bristles surrounding the germen. The interior filaments furnished with glandules at the base; the fruit a monospermous plum.

*Species.* 1. The nobilis, or evergreen bay-tree, is a native of Italy, and hath an upright trunk branching on every side from the bottom upward; with spear-shaped, nervous, stiff, evergreen leaves, three inches long and two broad; and small, yellowish, quadrifid, diœcious flowers, succeeded by red berries in autumn and winter. Of this species there are varieties, with broad, narrow, striped, or waved leaves 2. The æsti-

valis, or deciduous bay, grows naturally in North America. It rises with an upright stem, covered with a purplish bark; having oblong, oval, acuminate, veined, deciduous leaves, two or three inches long, and half as broad, growing opposite; with small white flowers succeeded by red berries. 3. The benzoin, or benjamin tree, is also a native of North America; grows 15 or 20 feet high, divided into a very branching head; with oval, acute, deciduous leaves, three or four inches long, and half as broad; and small yellowish flowers, not succeeded by berries in this country. 4. The safafra is a native of the same country. It hath a shrub-like straight stem, garnished with both oval and three-lobed, shining, deciduous leaves, of different sizes, from three to six inches long, and near as broad, with small yellowish flowers succeeded by blackish berries, but not in this country. 5. The indica, or Indian bay-tree, rises with an upright straight trunk, branching regularly 20 or 30 feet high; adorned with very large, spear-shaped, plane, nervous, evergreen leaves on reddish footstalks; and bunches of small whitish-green flowers, succeeded by large oval black berries which do not ripen in this country. 6. The borbonia, or Carolina red bay-tree, rises with an upright straight stem, branching 15 or 20 feet high; with large, spear-shaped, evergreen leaves, transversely veined; and long bunches of flowers on red footstalks, succeeded by large blue berries sitting in red cups. 7. The camphora, or camphor-tree, grows naturally in the woods of the western parts of Japan, and in the adjacent islands. The root smells stronger of camphor than any of the other parts, and yields it in greater plenty. The bark of the stalk is outwardly somewhat rough; but in the inner surface smooth and mucous, and therefore easily separated from the wood, which is dry and of a white colour. The leaves stand upon slender footstalks, have an entire undulated margin, running out into a point; have the upper surface of a lively and shining green, the lower herbaceous and silky; and are furnished with a few lateral nerves, which stretch archwise to the circumference, and frequently terminate in small warts; a circumstance peculiar to this species of laurus. The flowers are produced on the tops of footstalks, which proceed from the arm-pits of the leaves; but not till the tree has attained considerable age and size. The flower-stalks are slender, branched at the top, and divided into very short pedicles, each supporting a single flower. These flowers are white, and consist of six petals, which are succeeded by a purple and shining berry of the size of a pea, and in figure somewhat top-shaped. It is composed of a soft pulpy substance that is purple, and has the taste of cloves and camphor; and of a nucleus or kernel of the size of a pepper, that is covered with a black, shining, oily cortice, of an insipid taste. 8. The cinnamomum, or cinnamon-tree, is a native of Ceylon. It hath a large root, and divides into several branches, covered with a bark, which on the outer side is of a greyish brown, and on the inside has a reddish cast. The wood of the root is hard, white, and has no smell. The body of the tree, which grows to the height of 20 or 30 feet, is covered, as well as its numerous branches, with a bark which at first is green and afterwards red. The leaf is longer and narrower than the common bay-tree; and it is three-nerved, the

nerves

7 u. 1. nerves vanishing towards the top. When first unfolded, it is of a flame colour: but after it has been for some time exposed to the air, and grows dry, it changes to a deep green on the upper surface, and to a lighter on the lower. The flowers are small and white, and grow in large bunches at the extremity of the branches: they have an agreeable smell, something like that of the lily of the valley. The fruit is shaped like an acorn, but is not so large. 9. The cassia, or base cinnan on, has lanceolated leaves, triple-nerved. 10. The Persea, avocado-pear tree, or alligator pear, rises to a considerable height, with a straight trunk, of which the bark and wood are of a greyish colour. The leaves are long, oval, pointed, of a substance like leather, and of a beautiful green colour. The flowers are produced in large knots or clusters at the extremities of the branches, and consist each of six petals disposed in the form of a star, and of a dirty white or yellow colour, with an agreeable odour, which diffuses itself to a considerable distance. It is a native of the West Indies. The Persea begins to bear two years and a half, or at most three years after being planted; and, like most of the trees in warm climates, bears twice a year. There are two other species of this genus, but possessed of no remarkable properties.

*Culture.* The first species is propagated by layers, or by the berries. In order to raise a quantity of these trees by layers, some stools should be planted for the purpose; and after these are shot about a yard high, the branches must be brought down to the ground in the winter, all the preceding summer's shoots laid on it, and pegged down (being first slit in the joint), and the leaves taken off, which would otherwise be under ground. In one year's time these layers will have taken root; and in the spring they should be taken up, and planted in the nursery a foot asunder, in rows two feet distance. After they are planted out, if the weather should prove dry, they must be constantly watered; for without such care, it is difficult to make this tree grow. After they have taken well to the ground, they will require no farther trouble than keeping them clean from weeds, and digging between the rows each winter, till they are finally planted out. 2. In order to raise this tree from the berries, they ought to hang on the trees till about January before they are gathered. A well-sheltered spot of ground for the feminary must be made choice of; and having the mould smooth and fine, they should be sown soon after they are gathered, in beds or drills, rather more than half an inch deep. Towards the close of the spring the plants will come up, and during summer must be duly attended, by watering and weeding. In the winter following, their sheltered situation must not be trusted to, to defend them from the frost: Furze-bushes, or some such things, ought to be stuck in rows between the beds or drills, to guard them from the black frosts. Indeed, without this precaution, if the winter should prove very frosty, few of the young seedlings will be alive in spring. During the following summer, weeding and watering must be observed, and the winter after that they should be defended with covering as before; for they will be still in danger of being destroyed by severe frosts. In the ensuing spring, the strongest may be taken out of the feed-beds, and planted in the nursery way; though, if they have not by that time made good

shoots, it will be advisable to let them remain in their beds till the third spring; for a small plant of this kind is with more difficulty made to grow than one which is larger. When they are planted in the nursery, the distance which should be allowed them is the same as the layers, a foot asunder and two feet distance in the rows; and this will not be found too close; for notwithstanding the greatest care is exerted in planting them in the nursery, even making choice of rainy and cloudy weather, which must always be observed in setting them out, many of them will be lost by being transplanted. After they are thus planted out in the nursery, whether layers or seedlings, they must be still watered in dry weather, kept free from weeds, and the rows dug between every winter. You will even find, that those plants which suffer least by being transplanted will have met with a check, which they will not recover in two or three years; and till they have acquired new strength they should not be taken from the nursery; but when they appear to be good stiff plants, having the year before made a vigorous shoot, they will be then proper plants for planting out where they are to remain. Holes should be got ready for their reception; and as soon as the first autumnal rains fall, the work should be set about, especially if the land be gravelly or dry; but if it be moist, the spring will do as well. Being now planted at one yard distance, they will make a poor progress for two or three years more; but after this, when they have overcome all these difficulties, they will grow very fast, and arrive to be good trees in a few years. Although this tree flourishes best in old gardens, where the soil has been made rich and deep, and loves the shade, Hanbury tells us, "it thrives nevertheless exceedingly well in our hottest gravels and sands; and after it has surmounted the hardships of transplanting, will grow in such situations extremely fast, and arrive to a large bulk."

The propagation of the three next sorts of trees may be performed two or three ways, 1. By the seeds. These we receive, from the places where the trees grow naturally, in the spring. They should be preserved in sand; and as soon as they arrive, should be sown in largish pots an inch deep. The soil for their reception should be taken from a rich pasture at least a year before, with the sward. It should also be laid on an heap, and frequently turned, until the sward is grown rotten, and the whole appears well mixed and fine. If the pasture from whence it was taken near the surface is a sandy loam, this is the best compost for these seeds; if not, a small addition of drift or sea sand should be added, and well mixed with the other mould. After filling the pots with this soil, the seeds should be sown an inch deep; and then they should be plunged into common mould up to the rim. If the soil be naturally moist, it will keep them cooler, and be better; and if the place be well sheltered and shaded, it will be better still. Nothing more than weeding, which must be constantly observed during the summer, will be necessary; and in this station they may remain until the March following: about the middle of which month, having prepared a good hot-bed, the pots should be taken up and plunged therein. Soon after the seeds will come up; and when the young plants have sufficiently received the benefit of this bed, they should be enu-

*Larus cinereus.*

*Larus tricolor.*
